5. The combination of the carrier, breech-block, hollow hub, a cam supported immovably but detachably in said hub, a firing-head provided with a wing for engaging said cam, and a sear for engaging a shoulder of the firing-head, substantially as set forth.

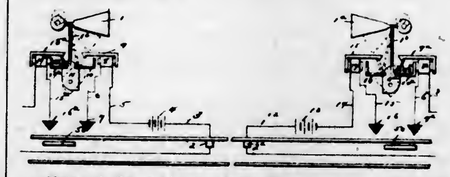
6. The combination of the carrier, breech-block, hollow hub, a cam supported immovably but detachably in said hub, a firing-head provided with a wing for engaging said cam, a sear for engaging a shoulder of the firing-head, and a shaft extending into the hub and provided with means for shifting the sear, substantially as set forth.

7. The combination with the carrier, a block, hollow hub, sear, cam and shaft, of a firing-head having an insulated rod, and means for locking the shaft when firing electrically, substantially as set forth.

8. The combination with the carrier, block, hollow hub and firing-head, of means for retracting the head on turning the block, and a sear for engaging a shoulder on the head, said sear consisting of a frame with trunnions and a lip, said frame supported within the hub, substantially as set forth.

9. The combination with the carrier, block, hollow hub and firing-head, of a cam for retracting the head, said cam consisting of a sleeve with cam edges, and a sear having a lip to engage a shoulder on the head, and with trunnions adapted to bearings on the cam-sleeve, substantially as set forth.

812,433. **ELECTRICAL RAILWAY SIGNALING SYSTEM.** CHARLES MITCHELL and HARRY MILLINGAR, East St. Louis, Ill., assignors of one-half to Harry E. Dickinson, East St. Louis, Ill. Filed Aug. 8, 1903. Serial No. 168,761.



Claim.—1. In combination with a block of a railway system, of a signaling system having a semaphore mounted at each end of the block, an eccentric connected to each semaphore provided with a catch, oppositely-arranged electromagnets for moving the eccentries in opposite directions and latching the same for operating the semaphore and electrical circuits for operating said electromagnets by the train as the train enters or leaves the block.

2. In combination with a block of a railway system, of a signaling system having a semaphore mounted at each end of the block, an eccentric connected to each semaphore provided with a catch, oppositely-arranged electromagnets for moving the eccentrics in opposite directions and latching the same for operating the semaphore, electrical circuits for operating said electromagnets by the train as the train enters or leaves the block, and an electrically-operated trip for operating the air-brake system of a train operated simultaneously with any of the electrical circuits connected with the said electromagnets.

3. In combination with a block of a railway system, of a signaling system, consisting of a semaphore mounted at each end of the block, means connected to the semaphore provided with a catch, oppositely-arranged electromagnets for moving the means in opposite directions, and locking the same for controlling the semaphores, and electric circuits for operating said electromagnets connected by the train as the train enters or leaves the block.

4. In combination with a block of a railway system, of a signaling system therefor, having a semaphore mounted at each end of the block, means connected to each semaphore provided with a catch,

oppositely-arranged electromagnets for operating the said means in opposite directions and locking the same for operating the semaphores, electric circuits for operating the electromagnets connected

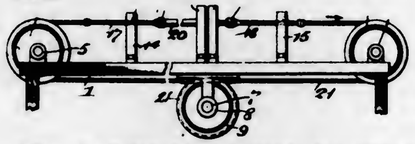
2. A process for helically grooving tubes, consisting in giving a plain tube a simultaneous lengthwise and rotary movement between suitable dies to force in portions thereof to form a series of helical

of plates provided with openings registering with said inlet and outlet openings respectively and holding-bolts embedded in said block

3. A butter-press comprising a casing for containing the butter in bulk, provided with forward and rearward

opositely-arranged electromagnets for operating the said means in opposite directions and locking the same for operating the semaphores, electric circuits for operating the electromagnets connected by a train as the train enters or leaves the block, and an electric trip for operating the air-brake system of a train operated simultaneously with any of the electric circuits connected with the said electromagnets.

812,434. MACHINE FOR HELICALLY GROOVING TUBES. ROBERT C. MONTGOMERIE, New York, N. Y., assignor of one-half to Emma Mann Vynne, New York, N. Y. Filed Apr. 20, 1904. Serial No. 208,491.



Claim.—1. A machine for helically grooving tubes, comprising a table, die-holders fixed thereon each having a central hole, dies in said holders projecting into said hole, means for drawing the tube through said dies and means for turning it during its passage, substantially as described.

2. A machine for helically grooving tubes, comprising a table, die-holders fixed thereon each having a central hole, dies adjustably held in said holders and projecting into said holes, means for drawing a tube through said dies and means for turning it during its passage, substantially as described.

3. A machine for helically grooving tubes, comprising a table, die-holders fixed thereon each having a stationary member provided with a central hole, and an oscillatory member, dies adjusted by said oscillatory member, means for drawing a tube through said dies and means for turning it during its passage, substantially as described.

4. A machine for helically grooving tubes, comprising a table, die-holders fixed thereon each having a stationary member provided with a central hole, and an oscillatory member having grooves, dies engaging said cam-grooves and adjustable thereby, means for drawing a tube through said dies and means for turning it during its passage, substantially as described.

5. A machine for helically grooving tubes, comprising a table, die-holders fixed thereon each having a stationary member provided with a central hole, a worm, and an oscillatory member having a segment of worm-gear engaged by said worm, and cam-grooves, dies engaging said grooves and adjustable thereby, means for drawing a tube through said dies and means for turning it during its passage, substantially as described.

6. In a machine for helically grooving tubes, a table, a die-holder fixed thereon having a stationary member provided with a central hole, dies in said holder projecting into said hole, an oscillatory member engaging and operating said dies, and means for moving a tube lengthwise through said hole and for turning the tube during its movement, substantially as described.

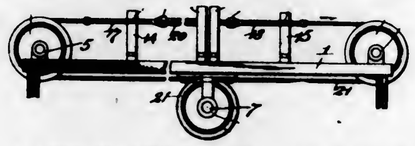
7. In a machine for helically grooving tubes, a table, a die-holder fixed thereon having a stationary member provided with a central hole and a worm, dies in said holder projecting into said hole, an oscillatory member having a segment of a worm-gear engaged by said worm and cam-grooves engaged by said dies, and means for moving a tube lengthwise through said hole and for turning the tube during its movement, substantially as described.

8. In a machine for helically grooving tubes, a table, a die-holder fixed thereon and comprising a stationary member having a central hole, dies reciprocably mounted thereon and having lugs, a worm, an adjustable stop, an oscillatory member having cam-slots engaged by the lugs of said dies, a segment of a worm-gear engaged by said worm and adjustable stops adapted to engage the stops on the stationary member, substantially as described.

812,435. PROCESS FOR HELICALLY GROOVING TUBES. ROBERT C. MONTGOMERIE, New York, N. Y., assignor of one-half to Emma Mann Vynne, New York, N. Y. Filed Apr. 20, 1904. Serial No. 208,492.

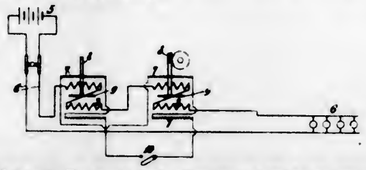
Claim.—1. A process for helically grooving tubes, consisting in giving a plain tube a simultaneous lengthwise and rotary movement between suitable dies to form a series of helical grooves in an intermediate portion and leave plain end portions and then giving this resultant product a lengthwise and rotary movement between suitable dies to reduce said plain end portions.

2. A process for helically grooving tubes, consisting in giving a plain tube a simultaneous lengthwise and rotary movement between suitable dies to force in portions thereof to form a series of helical grooves in an intermediate portion and leave plain end portions and then giving this resultant product a lengthwise and rotary movement between suitable dies to reduce said plain end portions.



3. A process for helically grooving tubes, consisting in giving a plain tube a simultaneous lengthwise and rotary feed between dies to form a series of helical grooves therein and leave plain end portions and then reducing the end portions.

812,436. SYSTEM OF CALIBRATING RECORDING WATT-HOUR METERS. DOUGLAS P. MORRISON, Newark, N. J. Filed June 17, 1905. Serial No. 265,666.



Claim.—1. The method of calibrating an unknown recording watt-hour meter, which consists in subjecting a standard meter to the same load as the unknown meter in such a manner that the current passes through the standard meter without operating the recording mechanism of the same, then starting and stopping the recording mechanism of the standard meter at will, and then comparing the observed units of the unknown meter with the recorded units of the standard meter.

2. The method of calibrating an unknown recording watt-hour meter, which consists in subjecting a standard meter to the same load as the unknown meter in such a manner that the current passes through the standard meter without operating the recording mechanism of the same, then starting and stopping the recording mechanism of the standard meter at will, and then comparing the observed units and fractions of units of the unknown meter with the recorded units and fractions of units of the standard meter.

3. The method of calibrating an unknown recording watt-hour meter which consists in subjecting a standard meter to the same load as the unknown meter in such a manner that the current passes through the standard meter without operating the recording mechanism of the same, then starting and stopping the recording mechanism of the standard meter at will, and then comparing the observed revolutions of the unknown meter with the recorded revolutions of the standard meter.

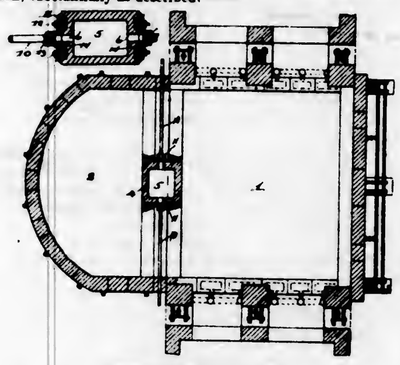
4. The method of calibrating an unknown recording watt-hour meter which consists in subjecting a standard meter to the same load as the unknown meter in such a manner that the current passes through the standard meter without operating the recording mechanism of the same, then starting and stopping the recording mechanism of the standard meter at will and then comparing the observed revolutions and fractions of revolutions of the unknown meter with the recorded revolutions and fractions of revolutions of the standard meter.

5. In a system of the character described, the combination with an unknown and a standard meter, whose field-coils are in circuit with each other and in circuit with the mains leading from the source to the load, of a potential-circuit for each meter leading to the mains, and a switch interposed in the potential-circuit of the standard meter.

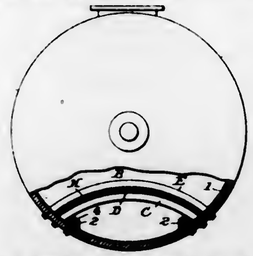
812,437. FIRE-CLAY BLOCK AND ATTACHMENT. REASON R. MORRISON, Mineral City, Ohio. Filed Jan. 16, 1905. Serial No. 241,219.

Claim.—The combination with a block of refractory fire-clay, provided with a central opening and inlet and outlet circulating-openings in the wall of said central opening, of couplings for the attachment of circulating-pipes to said circulating-openings consisting

of plates provided with openings registering with said inlet and outlet openings respectively and holding-bolts embedded in said block and passing through said plates and gaskets between said plates and block, substantially as described.



812,438. BARREL-FILTER. DE WITT C. MOSHER, Manitou, Colo. Filed Apr. 29, 1903. Serial No. 154,832.



Claim.—1. A barrel-filter composed of a barrel having a lead lining, and a filter consisting of an arched bed and transverse, arched rigid cores supporting it, with surrounding lead casings made integral with the lining, substantially as specified.

2. The combination with a lead-lined barrel, of an arched filtering-bed supported upon a series of transverse, arched rigid bars abutting against the barrel at the ends and covered with lead casings integral with the lining, substantially as set forth.

3. The combination with a lead-lined barrel, of an arched filter composed of arched cores having surrounding lead casings and supporting a filtering-bed, substantially as described.

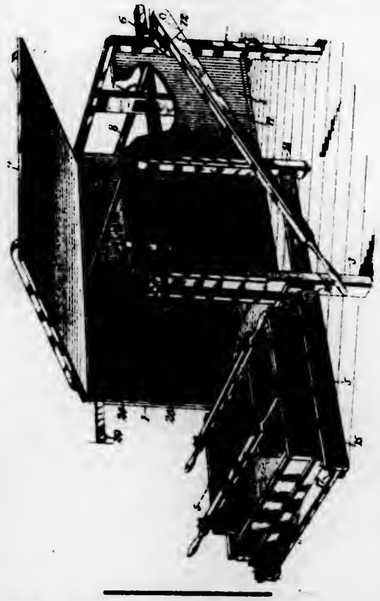
4. The combination with a lead-lined barrel, of a filter-bed, having supports with rigid cores and surrounding lead casings integral with the lining and by cross-pieces at the top of the bed also of rigid cores with lead casings integral with the lining, substantially as set forth.

812,439. BUTTER-PRESS. FRANK MURPHY, Lisbon, N. Y. Filed May 16, 1905. Serial No. 260,695.

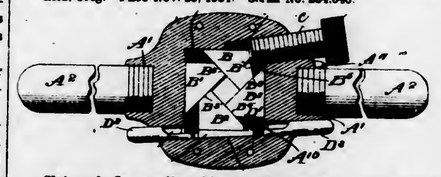
Claim.—1. A butter-press, comprising a casing for containing the butter in bulk, provided with forward and rearward supports, the former having notches therein, said casing also having hanging portions provided with corresponding notches, a mold for receiving expressed portions of butter from the casing, projecting parallel longitudinal members, and a removable slidable tray supported thereby, upon which the mold may be placed in operation, said members having portions thereof seated in said notches of the forward supports and hanging portions.

2. A butter-press, comprising a casing for containing the butter in bulk, provided with forward and rearward supports, the former having notches therein, said casing also having hanging portions provided with corresponding notches, a mold for receiving expressed portions of butter from the casing, projecting parallel longitudinal members, and a removable slidable tray supported thereby, upon which the mold may be placed in operation, said members having portions thereof seated in said notches of the forward supports and hanging portions and said casing having a movable plunger therein.

3. A butter-press comprising a casing for containing the butter in bulk, provided with forward and rearward supports, the former having notches therein, said casing also having hanging portions provided with corresponding notches, a mold for receiving expressed portions of butter from the casing, projecting parallel longitudinal members, and a removable slidable tray supported thereby, upon which the mold may be placed in operation, said members having portions thereof seated in said notches of the forward supports and hanging portions and said casing having a movable plunger therein and provided with means for operating the plunger.



812,440. ADJUSTABLE WRENCH. GEORGE MCKERAHAN, Marshfield, Oreg. Filed Nov. 23, 1904. Serial No. 234,040.



Claim.—1. In an adjustable wrench, a frame, a series of jaws disposed within the same in sliding contact with each other, means for adjusting said jaws by engagement with one thereof, a locking device inserted beneath the base of one of the jaws, and operating means therefor provided with push-pins projected beyond the frame at opposite sides of said device.

2. In an adjustable wrench, a frame, a series of jaws disposed within the same in sliding contact with each other, means for adjusting said jaws by engagement with one thereof, a locking device comprising a wedge-block inserted beneath the base of one of the jaws, and operating means disposed at the opposite ends of said block to bear thereon and having exposed ends projected through the frame.

3. In an adjustable wrench, a frame, a series of jaws disposed within the same in sliding contact with each other, means for adjusting said jaws by engagement with one thereof, a locking device comprising a wedge-block inserted beneath the base of one of the jaws, slidable operating means disposed at the opposite ends of said block to bear thereon, and means movable with the operating means to engage and shift the jaw when released.

4. In an adjustable wrench, a frame provided with a jaw-opening therein having at one side an inclined face, a series of jaws disposed within the same in sliding contact with each other, means for adjusting said jaws by engagement with one thereof, a locking device

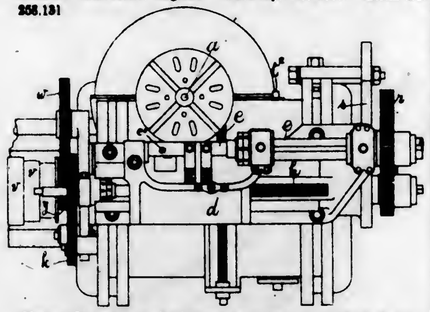
4. In a device of the class described, the combination with a casing having an opening, a valve in the opening, an auxiliary valve

Claim.—1. An electromagnetic device, including a plurality of legs or branches each comprising a plurality of poles of unlike po-

comprising a wedge-block inserted beneath the base of one of the jaws and slidably mounted upon said inclined face, and slidable operating means for said wedge-block disposed in recesses in alinement with said inclined face and provided with push-pins projected through the frame at each end of said block.

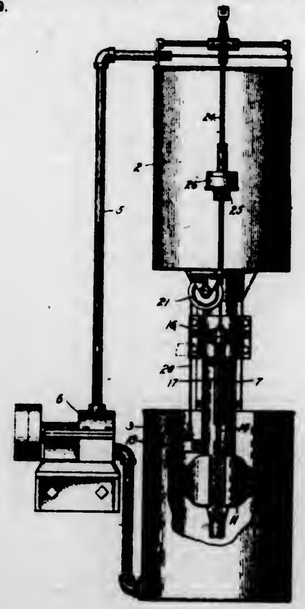
5. In an adjustable wrench, a frame provided with a jaw-opening therein having at one side an inclined face, a wedge member disposed upon said face, a series of jaws contacting with the walls of said opening and with a face of said wedge member, slidable operating-pins for said wedge member disposed in openings in alinement with said inclined face, and enlarged contact-heads upon said pins adapted to seat in recesses at the inner end of said openings.

812,441. **WORM-WHEEL-CUTTING MACHINE.** WILLIAM B. MCLEAN, Manchester, England. Filed Apr. 29, 1905. Serial No. 258,131.



Claim.—In a worm-wheel-cutting machine, a carriage *d*, upon which the cutter-bar *c* carrying the cutter c^3 is mounted, a screw-shaft *h*, connected with said carriage, a train of gear-wheels *k* in connection with said screw-shaft, a train of gear-wheels *r*, in connection with cutter-bar *c*, a shaft *c*, connected to said train *r*, gearing *l*, *l'*, *m*, *m'*, connecting said shaft to said train of wheels *k*, a wheel-spindle *a*, and gearing *b*, *c'*, connecting said shaft *c* with said spindle *a*, for the purpose and in manner substantially as herein shown and described.

812,442. **METHOD OF HARDENING.** WILLIAM E. NICKERSON, Cambridge, Mass., assignor to Gillette Safety Razor Company, Boston, Mass., a Corporation of Maine. Filed Sept. 26, 1903. Serial No. 174,739.



Claim.—1. The herein-described method of hardening thin steel articles which consists in interleaving said articles with sheets of metal of relatively high heat conductivity as compared with steel, confining said articles and sheets in a stack, heating said stack, and subjecting the hot stack to the action of a chilling medium, substantially as described.

2. The herein-described method of hardening thin steel articles, which consists in interleaving said articles with sheets of metal of relatively high heat conductivity, confining said articles and sheets in a stack with the edges of said sheets projecting beyond the edges of said articles, heating said stack, and subjecting the hot stack to the action of a chilling medium.

3. The herein-described method of hardening thin steel articles, which consists in interleaving said articles with sheets of metal of relatively high heat conductivity as compared with steel, confining said articles and sheets in a stack, heating said stack and subjecting the hot stack to the action of a flow of cold liquid.

4. The herein-described method of hardening thin steel articles, which consists in interleaving said articles with sheets of metal of relatively high heat conductivity, confining said articles and sheets in a stack with the edges of said sheets projecting beyond the edges of said articles, heating said stack, and subjecting the hot stack to the action of a flow of cold liquid.

812,443. **BOOT AND SHOE.** ARTHUR W. NORTH, Woodland, Cal., administrator of Samuel Wilde, deceased. Filed Sept. 21, 1904. Serial No. 225,295.

Claim.—1. In a boot or shoe, the combination of a shell having a sole portion, side portions integral therewith, the front edges of said side portions being united to form a toe portion and the rear edges being united to form a heel portion, an insole within the shell and a top having its lower edges lasted around the insole and secured between the insole and the shell, said top being secured to the shell along the upper edges of the latter, substantially as described.

2. In a boot or shoe, the combination of a shell having a sole portion, side portions integral therewith, the front edges of said side portions being united to form a toe portion and the rear edges being united to form a heel portion, an insole within the shell, a top having its lower edges lasted around the insole and secured between the insole and the shell, said top being secured to the shell along the upper edges of the latter and a protecting-strip adapted to cover the union of the toe portion of the shell, substantially as described.

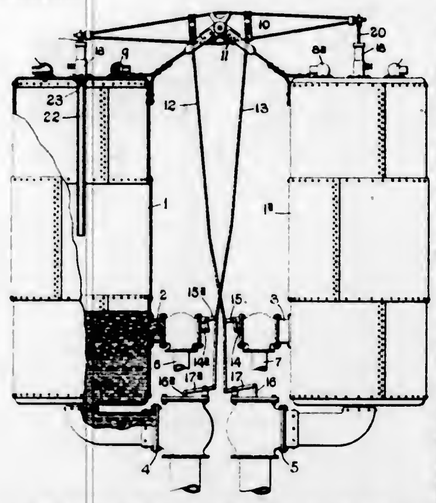
812,444. **VALVE-OPERATING MEANS FOR HYDRAULIC PUMPS.** BRYAN OBEAR, St. Louis, Mo., assignor to The Montague Compressed Air Company of Missouri, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 1, 1904. Serial No. 201,100.

Claim.—1. In a device of the class described, the combination with a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, a check-valve for the same passage carried by said valve and movable in a direction opposite to the opening movement of the first-named valve, a valve-actuating device carried by the first-named valve, a tension device on the first-named valve, and a piston to receive a fluid impulse when the first-named valve is unseated; substantially as described.

2. In a device of the class described, the combination with a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, a check-valve for the same passage, a spring bearing upon the first-named valve, a tube surrounding the opening and projecting into the casing to which the first-named casing is attached, a valve-actuating device in the tube and capable of moving the valve under pressure, said valve-actuating device comprising a plunger and rigid with the said valve; substantially as described.

3. A device of the class described, comprising a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, said valve having a central channel with radial ports adapted to communicate therewith, a check-valve for the same passage and for closing communication between the ports and the central channel, means for seating the first-named valve, and a plunger carried by the first-named valve for unseating it; substantially as described.

4. In a device of the class described, the combination with a casing having an opening, a valve in the opening, an auxiliary valve carried by the first-named valve and capable of opening and closing the ports therein, a spring on the first-named valve, a support above the spring, a stem carried by the support and threaded therein, means on the stem bearing against the spring, a gear carried by the stem and slidable thereon, a gear meshing with the first-named gear, and means for actuating the last-named gear to cause compression or expansion of the spring through the medium of the stem; substantially as described.



5. In a device of the class described, the combination with a casing having an opening, a ported valve in the opening, an auxiliary valve carried by the first-named valve and capable of opening and closing the ports therein, a spring on the first-named valve, a removable support above the spring, a stem carried by the support and threaded therein, a flanged disk on the stem and bearing against the spring, a gear carried by the stem and slidable thereon, a gear meshing with the first-named gear, and means for actuating the last-named gear to cause compression or expansion of the spring; substantially as described.

6. In a device of the class described, a casing having a hollow valve at one end, a cylinder surrounding the hollow valve and communicating therewith, a yielding means within the cylinder for normally retaining the valve upon its seat, a check-valve within the first-named valve and positioned above radial ports in said valve, a resilient means for normally holding the second valve seated, a depending tube adapted to communicate with the cylinder when the first-named valve is unseated, and a plunger rigid with the first-named valve and movable in said tube; substantially as described.

7. In a device of the class described, a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, a yielding means for normally retaining the valve upon its seat, a check-valve for the same passage and carried by said valve, said check-valve being within the first-named valve and positioned above radial ports therein, a tension device for the first-named valve, and means for regulating the tension device including a stem having a rotative and a reciprocatory movement; substantially as described.

812,445. **MULTIPOLAR ELECTROMAGNET.** HERMANN G. PAPE, New York, N. Y. Filed May 17, 1904. Serial No. 208,469.

Claim.—1. An electromagnetic device, including a plurality of legs or branches each comprising a plurality of poles of unlike polarity, each of said poles having paramagnetic connection with a pole of another leg or branch.

2. An electromagnetic device, including a plurality of legs or branches each comprising a pair of poles of unlike polarity and an exciting-coil, each pole having paramagnetic connection with a pole of another leg or branch of the device.

3. An electromagnetic device, including a plurality of legs or branches each having a plurality of poles and an interposed coil, and paramagnetic connectors each connecting a pole of one leg to a pole of another leg.

4. An electromagnetic device, including a plurality of legs or branches each including a plurality of poles of unlike polarity, and a plurality of paramagnetic connectors located at the same end of the device and each connecting a pole of one leg to a pole of another leg or branch.

5. An electromagnetic device, including a plurality of legs or branches each including a plurality of poles, a plurality of paramagnetic connectors located at the same end of the device and each connecting a pole of one leg to a pole of another leg or branch, and a diamagnetic connection between the connectors.

6. An electromagnetic device, including a plurality of legs or branches each including a shell, a core and an interposed coil, the shells and cores being paramagnetic, a paramagnetic connection between the cores, and a similar connection between the shells.

7. An electromagnetic device, including two magnets of approximate horseshoe form, both poles or ends of both magnets being disposed in approximately the same direction, and one or more exciting-coils common to the adjacent legs of said magnets and extended between the same.

8. An electromagnetic device, including a plurality of magnets all of whose poles are spaced apart throughout and disposed in approximately the same direction, and one or more exciting-coils common to said magnets.

9. An electromagnetic device, including a plurality of separate and distinct magnets spaced from each other, but having all of their poles disposed in approximately the same direction, and one or more exciting-coils common to the magnets and interposed at least in part between the same.

10. In an electromagnetic device, a plurality of magnets all of whose poles are disposed in approximately the same direction, and exciting-coils each of which is common to a plurality of magnets, each coil inclosing one pole and serving to excite another pole uninclosed thereby.

11. In an electromagnetic device, a plurality of magnets all of whose poles extend in approximately the same direction, and exciting-coils common to said magnets, said coils encircling the respective legs of one magnet and serving to excite another magnet the legs of which are not inclosed by the coils.

12. An electromagnetic device, comprising a plurality of legs each including unlike poles, unlike poles of different legs being paramagnetically connected.

13. An electromagnetic device comprising a plurality of legs each including unlike poles and a coil, unlike poles of different legs being paramagnetically connected.

14. An electromagnetic device, comprising a plurality of legs each having unlike poles and an interposed coil, and separated paramagnetic connectors connecting unlike poles of different legs.

15. An electromagnetic device, comprising a plurality of legs each including unlike poles and a coil, spaced paramagnetic connectors rigidly connecting unlike poles of different legs, and diamagnetic means uniting the connectors.

16. An electromagnetic device, comprising a paramagnetic plate having a plurality of openings, paramagnetic shells terminally secured therein, and concentric cores within the shells and extended beyond the connected ends thereof, a paramagnetic bar connecting the extended ends of the cores, a diamagnetic bolt rigidly connecting the bar and plate, and coils wound upon the cores.

17. An electromagnetic device, including a plurality of magnets having their unlike poles paired, one or more exciting-coils common to said magnets, and an armature.

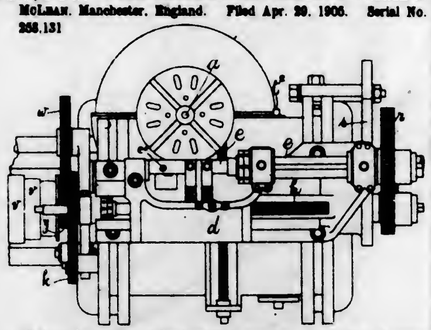
18. An electromagnetic device, including a pair of magnets spaced apart throughout but having their unlike poles disposed in adjacent relation and extended in the same direction, exciting-coils common to both magnets and mounted on the respective legs or poles of one magnet, and an armature common to both magnets.

19. An electromagnetic device, comprising a plurality of legs each including unlike poles, unlike poles of different legs being para-

comprising a wedge-block inserted beneath the base of one of the jaws and slidably mounted upon said inclined face, and slidable operating means for said wedge-block disposed in recesses in alinement with said inclined face and provided with push-pins projected through the frame at each end of said block.

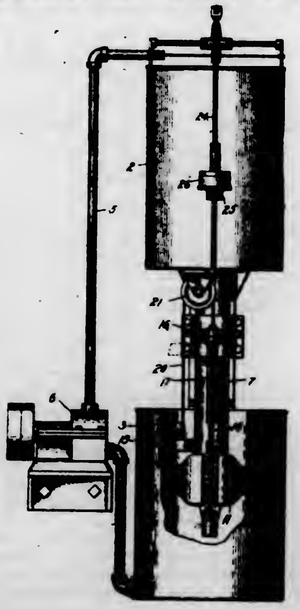
5. In an adjustable wrench, a frame provided with a jaw-opening therein having at one side an inclined face, a wedge member disposed upon said face, a series of jaws contacting with the walls of said opening and with a face of said wedge member, slidable operating-pins for said wedge member disposed in openings in alinement with said inclined face, and enlarged contact-heads upon said pins adapted to seat in recesses at the inner end of said openings.

812,441. **WORM-WHEEL-CUTTING MACHINE.** WILLIAM B. MCLEAN, Manchester, England. Filed Apr. 20, 1905. Serial No. 256,131.



Claim.—In a worm-wheel-cutting machine, a carriage *d*, upon which the cutter-bar *e* carrying the cutter e^3 is mounted, a screw-shaft *h*, connected with said carriage, a train of gear-wheels *k* in connection with said screw-shaft, a train of gear-wheels *r*, in connection with cutter-bar *e*, a shaft *c*, connected to said train *r*, gearing *l*, *l'*, *m*, *m'*, connecting said shaft to said train of wheels *k*, a wheel-spindle *a*, and gearing *b*, *c'*, connecting said shaft *c* with said spindle *a*, for the purpose and in manner substantially as herein shown and described.

812,442. **METHOD OF HARDENING.** WILLIAM E. NICKERSON, Cambridge, Mass., assignor to Gillette Safety Razor Company, Boston, Mass., a Corporation of Maine. Filed Sept. 28, 1903. Serial No. 174,739.



Claim.—1. The herein-described method of hardening thin steel articles which consists in interleaving said articles with sheets of metal of relatively high heat conductivity as compared with steel, confining said articles and sheets in a stack, heating said stack, and subjecting the hot stack to the action of a chilling medium, substantially as described.

2. The herein-described method of hardening thin steel articles, which consists in interleaving said articles with sheets of metal of relatively high heat conductivity, confining said articles and sheets in a stack with the edges of said sheets projecting beyond the edges of said articles, heating said stack, and subjecting the hot stack to the action of a chilling medium.

3. The herein-described method of hardening thin steel articles, which consists in interleaving said articles with sheets of metal of relatively high heat conductivity as compared with steel, confining said articles and sheets in a stack, heating said stack and subjecting the hot stack to the action of a flow of cold liquid.

4. The herein-described method of hardening thin steel articles, which consists in interleaving said articles with sheets of metal of relatively high heat conductivity, confining said articles and sheets in a stack with the edges of said sheets projecting beyond the edges of said articles, heating said stack, and subjecting the hot stack to the action of a flow of cold liquid.

812,443. **BOOT AND SHOE.** ARTHUR W. NORTH, Woodland, Cal., administrator of Samuel Wilde, deceased. Filed Sept. 21, 1904. Serial No. 225,295.

Claim.—1. In a boot or shoe, the combination of a shell having a sole portion, side portions integral therewith, the front edges of said side portions being united to form a toe portion and the rear edges being united to form a heel portion, an insole within the shell and a top having its lower edges lasted around the insole and secured between the insole and the shell, said top being secured to the shell along the upper edges of the latter, substantially as described.

2. In a boot or shoe, the combination of a shell having a sole portion, side portions integral therewith, the front edges of said side portions being united to form a toe portion and the rear edges being united to form a heel portion, an insole within the shell, a top having its lower edges lasted around the insole and secured between the insole and the shell, said top being secured to the shell along the upper edges of the latter and a protecting-strip adapted to cover the union of the toe portion of the shell, substantially as described.

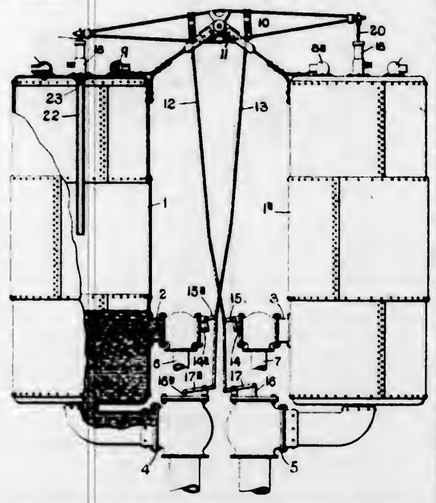
812,444. **VALVE-OPERATING MEANS FOR HYDRAULIC PUMPS.** BRYAN OREAR, St. Louis, Mo., assignor to The Montague Compressed Air Company of Missouri, St. Louis, Mo., a Corporation of Missouri. Filed Apr. 1, 1904. Serial No. 201,100.

Claim.—1. In a device of the class described, the combination with a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, a check-valve for the same passage carried by said valve and movable in a direction opposite to the opening movement of the first-named valve, a valve-actuating device carried by the first-named valve, a tension device on the first-named valve, and a piston to receive a fluid impulse when the first-named valve is unseated; substantially as described.

2. In a device of the class described, the combination with a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, a check-valve for the same passage, a spring bearing upon the first-named valve, a tube surrounding the opening and projecting into the casing to which the first-named casing is attached, a valve-actuating device in the tube and capable of moving the valve under pressure, said valve-actuating device comprising a plunger and rigid with the said valve; substantially as described.

3. A device of the class described, comprising a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, said valve having a central channel with radial ports adapted to communicate therewith, a check-valve for the same passage and for closing communication bwteeen the ports and the central channel, means for seating the first-named valve, and a plunger carried by the first-named valve for unseating it; substantially as described.

4. In a device of the class described, the combination with a casing having an opening, a valve in the opening, an auxiliary valve carried by the first-named valve and capable of opening and closing the ports therein, a spring on the first-named valve, a support above the spring, a stem carried by the support and threaded therein, means on the stem bearing against the spring, a gear carried by the stem and slidable thereon, a gear meshing with the first-named gear, and means for actuating the last-named gear to cause compression or expansion of the spring through the medium of the stem; substantially as described.

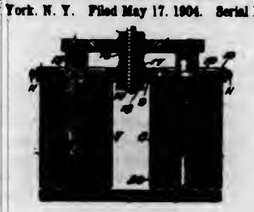


5. In a device of the class described, the combination with a casing having an opening, a ported valve in the opening, an auxiliary valve carried by the first-named valve and capable of opening and closing the ports therein, a spring on the first-named valve, a removable support above the spring, a stem carried by the support and threaded therein, a flanged disk on the stem and bearing against the spring, a gear carried by the stem and slidable thereon, a gear meshing with the first-named gear, and means for actuating the last-named gear to cause compression or expansion of the spring; substantially as described.

6. In a device of the class described, a casing having a hollow valve at one end, a cylinder surrounding the hollow valve and communicating therewith, a yielding means within the cylinder for normally retaining the valve upon its seat, a check-valve within the first-named valve and positioned above radial ports in said valve, a resilient means for normally holding the second valve seated, a depending tube adapted to communicate with the cylinder when the first-named valve is unseated, and a plunger rigid with the first-named valve and movable in said tube; substantially as described.

7. In a device of the class described, a casing having an opening at one end, a valve in the opening, a passage from the casing through the valve, a yielding means for normally retaining the valve upon its seat, a check-valve for the same passage and carried by said valve, said check-valve being within the first-named valve and positioned above radial ports therein, a tension device for the first-named valve, and means for regulating the tension device including a stem having a rotative and a reciprocatory movement; substantially as described.

812,445. **MULTIPOLAR ELECTROMAGNET.** HERMANN G. PAPE, New York, N. Y. Filed May 17, 1904. Serial No. 208,469.



Claim.—1. An electromagnetic device, including a plurality of legs or branches each comprising a plurality of poles of unlike polarity, each of said poles having paramagnetic connection with a pole of another leg or branch.

2. An electromagnetic device, including a plurality of legs or branches each comprising a pair of poles of unlike polarity and an exciting-coil, each pole having paramagnetic connection with a pole of another leg or branch of the device.

3. An electromagnetic device, including a plurality of legs or branches each having a plurality of poles and an interposed coil, and paramagnetic connectors each connecting a pole of one leg to a pole of another leg.

4. An electromagnetic device, including a plurality of legs or branches each including a plurality of poles of unlike polarity, and a plurality of paramagnetic connectors located at the same end of the device and each connecting a pole of one leg to a pole of another leg or branch.

5. An electromagnetic device, including a plurality of legs or branches each including a plurality of poles, a plurality of paramagnetic connectors located at the same end of the device and each connecting a pole of one leg to a pole of another leg or branch, and a diamagnetic connection between the connectors.

6. An electromagnetic device, including a plurality of legs or branches each including a shell, a core and an interposed coil, the shells and cores being paramagnetic, a paramagnetic connection between the cores, and a similar connection between the shells.

7. An electromagnetic device, including two magnets of approximate horseshoe form, both poles or ends of both magnets being disposed in approximately the same direction, and one or more exciting-coils common to the adjacent legs of said magnets and extended between the same.

8. An electromagnetic device, including a plurality of magnets all of whose poles are spaced apart throughout and disposed in approximately the same direction, and one or more exciting-coils common to said magnets.

9. An electromagnetic device, including a plurality of separate and distinct magnets spaced from each other, but having all of their poles disposed in approximately the same direction, and one or more exciting-coils common to the magnets and interposed at least in part between the same.

10. In an electromagnetic device, a plurality of magnets all of whose poles are disposed in approximately the same direction, and exciting-coils each of which is common to a plurality of magnets, each coil inclosing one pole and serving to excite another pole uninclosed thereby.

11. In an electromagnetic device, a plurality of magnets all of whose poles extend in approximately the same direction, and exciting-coils common to said magnets, said coils encircling the respective legs of one magnet and serving to excite another magnet the legs of which are not inclosed by the coils.

12. An electromagnetic device, comprising a plurality of legs each including unlike poles, unlike poles of different legs being paramagnetically connected.

13. An electromagnetic device comprising a plurality of legs each including unlike poles and a coil, unlike poles of different legs being paramagnetically connected.

14. An electromagnetic device, comprising a plurality of legs each having unlike poles and an interposed coil, and separated paramagnetic connectors connecting unlike poles of different legs.

15. An electromagnetic device, comprising a plurality of legs each including unlike poles and a coil, spaced paramagnetic connectors rigidly connecting unlike poles of different legs, and diamagnetic means uniting the connectors.

16. An electromagnetic device, comprising a paramagnetic plate having a plurality of openings, paramagnetic shells terminally secured therein, and concentric cores within the shells and extended beyond the connected ends thereof, a paramagnetic bar connecting the extended ends of the cores, a diamagnetic bolt rigidly connecting the bar and plate, and coils wound upon the cores.

17. An electromagnetic device, including a plurality of magnets having their unlike poles paired, [illegible] or more exciting-coils common to said magnets, and an armature.

18. An electromagnetic device, including a pair of magnets spaced apart throughout but having their unlike poles disposed in adjacent relation and extended in the same direction, exciting-coils common to both magnets and mounted on the respective legs or poles of one magnet, and an armature common to both magnets.

19. An electromagnetic device, comprising a plurality of legs each including unlike poles, unlike poles of different legs being para-

magnetically connected, and an exciting-coil common to the unlike poles of a leg.

20. An electromagnetic device, including a plurality of magnets

drum and extending about the sheave that is mounted in the housing and attached to the sleeve.

812,449. **LEVEL.** WILLIAM POTTER, New York, N. Y. Filed Mar. 18, 1905. Serial No. 250,726.

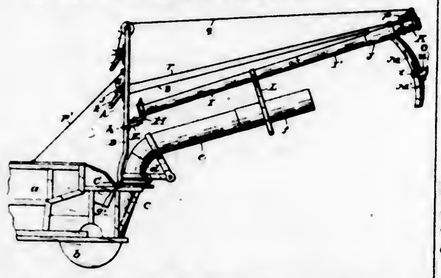
tal threaded or grooved slidable interior shaft within the said tubular propeller-head and main shaft; revoluble propeller-blades, and a main lock and a stern-lock; said propeller-head having blade-recesses, and

magnetically connected, and an exciting-coil common to the unlike poles of a leg.

20. An electromagnetic device, including a plurality of magnets having their unlike poles paired, and one or more exciting-coils common to said magnets and extended between the same.

21. An electromagnetic device, including a plurality of magnets spaced apart and having their unlike poles paired, one or more exciting-coils common to the magnets, and diamagnetic means connecting said magnets.

812,446. **STRAW-STACK SHAPER.** THOMAS S. PEARSON, Clay township, and GEORGE B. LINDSAY, Center township, Howard county, Ind. Filed May 15, 1905. Serial No. 260,379.



Claim.—1. A straw-stack shaper including a derrick, a movable boom, a guide-sleeve mounted slidingly on the boom, a deflector attached to the sleeve, a sheave mounted on the boom, a drum mounted on the derrick, a cable extending from the drum about the sheave to the sleeve, and a cable extending from the drum to the sleeve.

2. A straw-stack shaper including a boom, means for supporting the boom, a guide-sleeve mounted slidingly on the boom, a deflector attached to the sleeve and comprising a main part and a yielding part pivoted to the main part, and means for moving the sleeve on the boom.

3. The combination with a wind-stacker pipe, of a boom supported above the pipe, a guide-sleeve mounted movably on the boom, a dished deflector attached to the sleeve and extending opposite to the discharge-orifice of the pipe, and means for moving the deflector toward and from the end of the pipe.

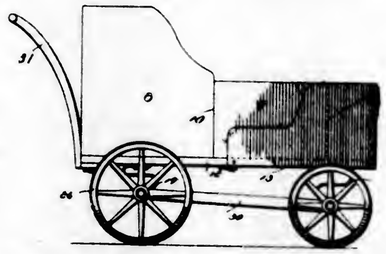
4. The combination with a wind-stacker pipe, of a boom supported above the pipe, a guide-sleeve mounted movably on the boom, means for moving the sleeve, a deflector attached to the sleeve and comprising a main part, a yielding part pivoted to the main part and provided with an arm, and a spring engaging said arm and also the main part.

5. The combination with a wind-stacker pipe, of a boom supported above the pipe, a sheave mounted on the boom, a guide-sleeve mounted movably on the boom, a deflector attached to the sleeve and thereby supported opposite to the end of the pipe, a winding-drum, a cable connected to the drum and also to the sleeve, and a second cable also connected to the drum and extending about the sheave and attached to the sleeve.

6. The combination with a separator and a wind-stacker provided with a movable discharge-pipe, of a derrick mounted on the separator, a boom mounted above the discharge-pipe and having cooperative connection therewith, a guide-sleeve mounted movably on the boom, a sheave supported by the boom, a deflector attached to the sleeve and thereby supported opposite to the end of the pipe, a winding-drum mounted on the derrick, a cable connected to the drum and also to the sleeve, and a second cable also connected to the drum and extending about the sheave and attached to the sleeve.

7. The combination with a separator and a wind-stacker having a discharge-pipe, of a derrick mounted on the separator and provided with two winding-drums supported thereby one above the other and also having a sheave mounted at the top thereof, a stay connected to the separator and also to the derrick, a telescopic boom connected pivotally to the derrick and extending above the discharge-pipe, a guide-sleeve mounted movably on the boom and carrying a deflector opposite to the end of the discharge-pipe, a housing attached to the end of the boom and supporting a sheave, a cable connected to the upper one of the drums on the derrick and extending over the sheave that is supported by the derrick to the housing and secured thereto, a cable connected to the lower one of the drums and attached to the sleeve, and a second cable connected also to the lower drum and extending about the sheave that is mounted in the housing and attached to the sleeve.

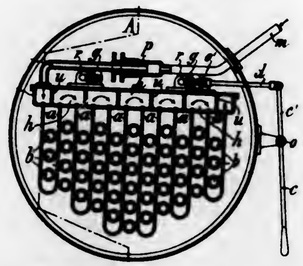
812,447. **CHILD'S CARRIAGE.** MAE PIERCY and CHARLES R. PIERCY, Redoak, Iowa. Filed Aug. 31, 1905. Serial No. 276,575.



Claim.—1. In a child's carriage, the combination of a running-gear comprising separable sections, and a body removably secured to the running-gear, and comprising side walls having sections hinged to fold inwardly, and a floor having a section hinged to fold against the folded side sections, said body when folded forming a case to receive the running-gear.

2. In a child's carriage, the combination of a body, and a running-gear comprising axles having separable spindle-sections, springs carried by the axle and removably secured to the body, said body comprising sections hinged to fold and form a case to receive the running-gear.

812,448. **SUPERHEATER.** WILHELM PLATZ, Weinheim, Germany. Filed Sept. 29, 1904. Serial No. 226,560.



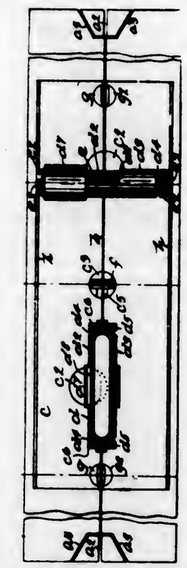
Claim.—1. In a superheater located in the smoke-box of a fire-tube boiler behind the fire-tubes, superheater-tubes arranged at right angles to the fire-tubes at the rear of the same, the diameter of said superheater-tubes being much less than the diameter of the fire-tubes and the superheater-tubes being arranged at distances so as not entirely to cover the openings in the ends of the fire-tubes and means for moving said superheater-tubes transversely of the boiler, substantially as described.

2. In a superheater of the class described, a casing, superheater-tubes connected thereto, said tubes being arranged at right angles to the fire-tubes near the ends thereof, and means for moving said superheater-tubes transversely of the boiler so as to cover and uncover the openings of the fire-tubes.

3. In a superheater of the character described, the combination of a casing, divided by longitudinal partitions into compartments separated by transverse partitions into chambers, series of U-shaped superheater-tubes connecting each two adjacent chambers of either compartment, telescopic steam inlet and outlet pipes, and means for displacing the superheater, substantially as herein set forth.

4. In a superheater of the character described, the combination of a casing, divided by longitudinal partitions into compartments separated by transverse partitions into chambers, series of U-shaped superheater-tubes connecting each two adjacent chambers of either compartment, telescopic steam inlet and outlet pipes, slotted lugs provided on the said casing, brackets extending through these slotted lugs, and an operating-lever connected with the aforesaid casing for displacing the superheater, substantially as herein set forth.

812,449. **LEVEL.** WILLIAM POTTER, New York, N. Y. Filed Mar. 18, 1905. Serial No. 250,735.



Claim.—1. An instrument of the class described, comprising a plate, a spirit-tube thereon, a straight-edge, a device arranged centrally of said plate for connecting the same to said straight-edge, a cord connected with said plate and secured to both ends of said straight-edge, said cord insuring a predetermined relation between said plate and said straight-edge, substantially as shown and described.

2. In an instrument of the class described, a straight-edge, a plate pivotally connected therewith, a spirit-tube on said plate, and a cord secured to the ends of said straight-edge and in operative connection with said plate, said cord insuring a predetermined relation between said plate and said straight-edge, substantially as shown and described.

3. In an instrument of the class described, a straight-edge, a plate thereon, and devices connecting said straight-edge and said plate, said devices including a cord secured to the ends of said straight-edge and in operative connection with said plate, substantially as shown and described.

4. In an instrument of the class described, a straight-edge, a plate detachably connected at the center thereof, a spirit-tube on said plate, a cord secured to the ends of said straight-edge, and devices on said plate in operative connection with said cord for holding said plate in a predetermined position on said straight-edge, substantially as shown and described.

5. In an instrument of the class described a straight-edge, a plate, a spirit-tube mounted thereon, said plate being provided with a central cup-shaped recess and said recess being provided with a radial slot, a screw in said straight-edge engaged in said recess, and devices connected with a cord for detachably connecting said plate with said straight-edge in a predetermined position, substantially as shown and described.

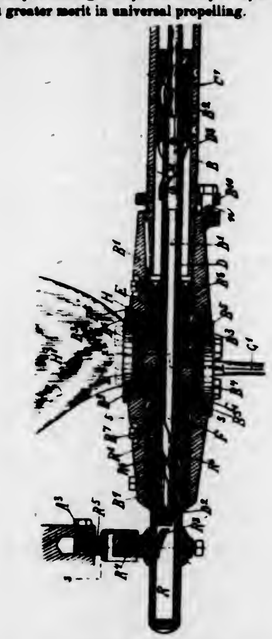
6. An instrument of the class described a straight-edge, a plate, a spirit-tube mounted thereon, a cord detachably connected with said straight-edge, devices on said plate for holding said cord comprising two segmental members at each end of said plate, the inner ends of said segmental members bearing against said cord and the outer ends of said segmental members permitting slight movement of said cord, substantially as shown and described.

812,450. **UNIVERSAL PROPELLING MECHANISM.** DANIEL W. RAFFINE, Brooklyn, N. Y. Filed Mar. 26, 1905. Serial No. 251,501.

Claim.—1. In a universal propeller, the combination of a tubular propeller-head secured to a tubular main propeller-shaft, a supplemental threaded or grooved slidable interior shaft within the said tubular propeller-head and main shaft; revoluble propeller-blades, and a main lock and a stern-lock; said propeller-head having blade-recesses, and blade-gears within the said recesses and held therein by threaded bearing-cups and bearing-cones removably secured to the propeller-head within the said recesses, the cups being held by screw-threads and by the threaded lock-rings and the said cones with screws and by a center stud therewith; said cups and cones having bearing-runways and opposing bearing-runways in the blade-gears, the said blade-gears having each a screwed center hole to receive and hold the screw-threaded center from the propeller-blades which are also fastened with bolts on the said blade-gears; said supplemental interior shaft having straight grooves which extend to become helical grooves having one direction in their certain helical tend; said main lock being tubular in form and having a helical open interior groove and secured within to the said tubular main shaft; and a pointed helical ridge secured on the said interior shaft, arranged to coact with the said open groove of the tubular main lock part, the said helical pointed ridge and said open helical groove having an opposite direction in their certain helical tend, from the aforesaid helical grooves on the said supplemental interior shaft; all the said ridge and said grooves capable of adjusting and holding the said propeller-blades and the said interior shaft as required and geared in connection with the main shaft; said supplemental shaft being connected to a swivel-rod and to a swivel therewith, said swivel preferably connected to a shifter-yoke which is secured to a longitudinal shifter-bar, connected to and shifted by a lever and the whole shifter and parts connected therewith capable of being shifted and held to effect the desired changes of the propeller-blades; said supplemental shaft having one bevel-gear slidable feathered, and operated by the aforesaid straight grooves; another bevel-gear mounted also slidable on this said supplemental shaft and having circular interior studs extending to the said grooves of the said supplemental shaft, and being operated by either the helical or straight portions of the grooves of this said interior shaft; one of the said bevel-gears in mesh with one of the said blade-gears and the other said bevel-gear in mesh with the other of the said blade-gears; said blade-gears having twice the number of teeth as the number of teeth on their said opposing bevel-gears; said bevel-gears having between them a tubular distance-piece and two threaded set-rings provided to keep them toward the said distance-piece with freedom to revolve and mesh with the said blade-gears; subjoined to the said propeller-head is the aforesaid stern-lock which consists of a tubular lock-shell with a flange thereon a stop-ring removably secured to the propeller-head, and a spring between the said flange and the said stop-ring being set therein to release and prevent the breaking of the parts and to get a quick action of the parts effecting the engagement between the said stern-lock and the said interior shaft; within the said stern-lock shell is provided an engaging member which may be a helical ridge or groove and a corresponding helical ridge or groove or an engaging member being provided on the rear end of the said interior shaft; the purpose of the stern-lock is to hold the said interior shaft from turning, while the said tubular propeller-head and main shaft may be continuously revolved, thereby developing the lateral propelling, which may be set to any direction by suitably shifting the said interior shaft, further into the helical stern-lock engagement; said stern-lock shell having a dog which coacts with a slot of a slot-pin, said slot-pin being preferably connected to a holder-post which also may be used for a rudder-post, the purpose of the said holder-post slot-pin and dog is to hold the stern-lock and parts connected therewith from turning, substantially as shown and described for purposes specified.

2. The combination in a universal propeller, a tubular propeller-head secured to a tubular main shaft, a supplemental threaded or grooved slidable interior shaft within the said tubular propeller-head and main shaft, revoluble propeller-blades and a main lock and a stern-lock; said main lock involving two opposing projecting points the sides of which incline to form a helical ridge and a helical groove and the said helical ridge coacting with the said helical groove whereby the said supplemental interior shaft may be shifted to a helical safety engagement with the said tubular main shaft and geared in connection therewith with liberty to move endwise to effect the required changes of the angle of the propeller-blades, and the said interior shaft being free to release its helical main-lock engagement and slide to receive the stern-lock engagement consisting of members for holding the said interior shaft from turning while the said tubular main shaft and propeller is revolved, thereby developing a lateral propelling, the said members involving a helical ridge or groove and a member which may be engaged to coact with the last-named helical ridge or groove to obtain the said lateral propelling in any directions preferred, and means whereby the said engagements

and the parts performing the operation may be opened and renewed to obtain a greater merit in universal propelling.



812,451. AIR-VALVE. WILLIAM J. RICE, Mason City, Iowa. Filed Nov. 7, 1904. Renewed July 23, 1905. Serial No. 270,897.

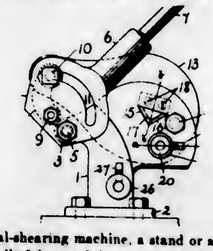
Claim.—1. In an air-valve, the combination of a float-chamber having an inlet in its lower part and a tube forming an outlet in the upper part, a float in the chamber, a rod extending from the float and loosely upward through the tube, a valve secured on the lower end of the rod, and another valve secured on the upper end of the rod to close alternately the opposite ends of the tube, the float being normally suspended from the upper valve.

2. In an air-valve, the combination of a float-chamber having an inlet in its lower part and a tube forming an outlet in the upper part, a float in the chamber, a rod extending from the float and loosely upward through the tube, a valve secured on the lower end of the rod, and another valve secured on the upper end of the rod to close alternately the opposite ends of the tube, the float being normally suspended from the upper valve, and a cap screw-threaded upon the upper end of the tube and adapted to hold the upper valve closed when so desired, said cap having apertures for the air to escape when the cap is not fully screwed down.

3. In an air-valve, the combination of a float-chamber having an inlet in its lower part and a tube forming an outlet in the upper part, a float in the chamber, a rod extending from the float and loosely upward through the tube, a valve secured on the lower end of the rod, and another valve secured on the upper end of the rod to close alternately the opposite ends of the tube, the float being normally suspended from the upper valve, said tube being adjustable up and down in the top of the chamber, and a jam-nut to hold the tube firmly at the desired elevation.

812,452. HAND-POWER SHEARS. FRANK A. RICHARDS, Philadelphia, Pa., assignor of one-half to John H. Richards, Philadelphia, Pa. Filed Nov. 3, 1905. Serial No. 285,699.

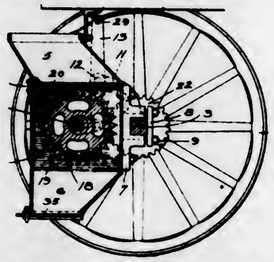
Claim.—1. In a metal-shearing machine, a standard, a slotted lever-plate and a shear-plate pivotally attached thereto, on opposite sides and at opposite ends, a link having one end attached to the lever-plate and its opposite end attached to the shear-plate and guided by a slot in the lever-plate, and a knife or cutter secured to make a circular-arc movement when cutting or shearing.



2. In a metal-shearing machine, a stand or standard, a slotted lever-plate pivotally fulcrumed thereto at one side, a shear-plate also pivotally fulcrumed to the standard at its opposite side, a link pivotally connected to the lever-plate independent of the lever-plate's pivot, and located between the lever-plate and the shear-plate, with its opposite end connected to the shear-plate and guided by the slot in the lever-plate, openings through the standard and shear-plates for the insertion of bars, rods and angles to be cut, and knifes or cutters moving in a circular arc for such cutting purposes.

3. In a metal-shearing machine, a standard, a slotted lever-plate pivotally fulcrumed thereto at one side, a shear-plate also pivotally fulcrumed to the standard at its opposite side, a link pivotally connected to the lever-plate independent of the lever-plate's pivot, and located between the lever-plate and the shear-plate, with its opposite end connected to the shear-plate and guided by the slot in the lever-plate, an angular opening through the standard, a corresponding opening through the shear-plate and a cutter therefor, a circular opening through the standard, a corresponding opening through the shear-plate, and a bushing die in each opening.

812,453. PORTABLE ICE-CRUSHER. JUSTUS A. RICKABAUGH, Altoona, Pa., assignor of one-half to William Milligan, Allegheny City, Pa. Filed Dec. 10, 1904. Serial No. 236,353.



Claim.—1. The combination with a suitable vehicle, of a receiving and storage box below the bed of said vehicle and carried thereby, a shaft suspended from said vehicle passing through enlarged openings in said box, clutch mechanism between said shaft and the vehicle-wheel, means for moving said shaft to effect the engagement of said clutch mechanism, ice-crushing mechanism on said shaft and means for rotating said shaft by the movement of said vehicle.

2. The combination with a suitable vehicle, of a receiving and storage box below the bed of said vehicle and carried thereby, a shaft suspended from said vehicle and passing through enlarged openings in said box, ice-crushing mechanism within said box carried by said shaft, a gear-wheel on said shaft, a gear-wheel on the vehicle-wheel, and means for throwing said first-named gear into and out of engagement with said second gear.

3. The combination with a suitable vehicle, of a receiving and storage box below the bed of said vehicle and carried thereby, a suspended shaft extending through enlarged openings formed in said box, a toothed crushing-roll on said shaft, and projecting teeth in said box with which the teeth on said crushing-roll mesh, and means for throwing said shaft into and out of engagement with the vehicle-wheel.

4. The combination with a suitable vehicle, of a receiving and storage box below the bed of said vehicle and carried thereby, a suspended shaft passing through enlarged openings in said box, a toothed crushing-roll carried by said shaft within said box, projecting teeth in said box with which the teeth of said crushing-roll mesh, a gear-wheel on said shaft, a gear on the vehicle-wheel, a lever connected to said shaft adapted to throw said gears into and out of engagement with each other.

5. The combination with a suitable vehicle, of a receiving and storage box below the bed of said vehicle at the rear thereof and carried thereby, a suspended shaft passing through enlarged openings in said box, a toothed crushing-roll carried by said shaft, projecting teeth in said box with which the teeth of said crushing-roll mesh, clutch mechanism between said shaft and the vehicle-wheel for throwing said shaft into and out of operative engagement with said wheel, a lever at the forward end of said vehicle, and connections between said clutch mechanism and said lever.

812,454. VALVE-BAG. JOHN ROGERS, Cleveland, Ohio, assignor to Bates Valve Bag Company, Cleveland, Ohio, a Corporation of West Virginia. Filed Feb. 29, 1904. Serial No. 195,818.

Claim.—1. A valve-bag, having a diamond-folded closure, the folds being permanently secured, and a filling-opening extending through the finishing folds and in position to be closed by one of the primary folds of the closure, as set forth.

2. A valve-bag, having a diamond-folded closure at each end, the folds being permanently secured, and a filling-opening extending through the finishing folds of one closure and in position to be closed by one of the primary folds of that closure, as set forth.

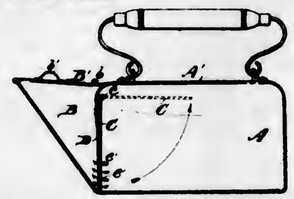
3. A valve-bag having a folded closure at one end, the folds permanently secured, and a filling-opening extending through the finishing fold and in position to be closed by one of the primary folds.

4. A valve-bag having a folded closure at one end, the folds permanently secured, and a filling-opening with a valve extension extending through the fabric of the valve at or near one corner.

812,455. VALVE-BAG. JOHN ROGERS, Cleveland, Ohio, assignor to Bates Valve Bag Company, Cleveland, Ohio, a Corporation of West Virginia. Filed Feb. 29, 1904. Serial No. 195,819.

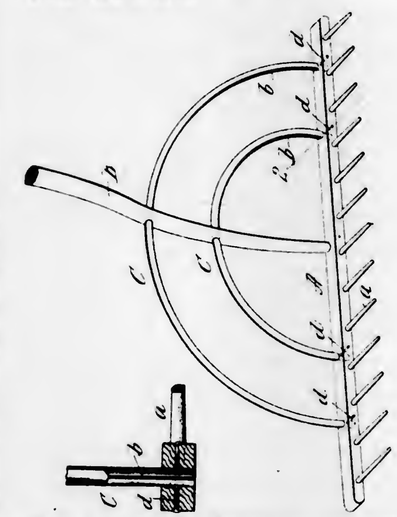
Claim.—A paper valve-bag having diamond-folded closures at each end, the folds being permanently secured, and a filling-opening in combination with a valve-like tube at or near one corner of the bag.

812,456. TEA-KETTLE. HARRY B. ROBBS, Detroit, Mich., assignor of one-half to Charles A. Gleason, Detroit, Mich. Filed Sept. 23, 1904. Serial No. 225,555.



Claim.—In a tea-kettle, a body portion having a flat imperforate top adapted for the reception of a plate or other article to be warmed, a spout projecting from the side wall of the body portion and beyond the line of the bail or handle, said spout having an opening into the body portion from top to bottom, and a depending flap hinged to the wall of the kettle at the top and provided with perforations near the bottom only of the flap for the discharge of water through the spout, substantially as described.

812,457. RAKE. FRANCIS A. RUGG, Greenfield, Mass. Filed Nov. 20, 1905. Serial No. 288,169.



Claim.—1. As a new article of manufacture, a rake having bows intermediately engaged with the rake-handle, and by their extremities connected with the rake-head, and made of comparatively light gage metal tubing for the production of an extremely strong and more durable implement.

2. As a new article of manufacture, a rake having bows intermediately engaged with the rake-handle, and by their extremities connected with the rake-head, and composed of unseamed metal tubing, arranged with their seam-lines at the inner or concave side of the bows.

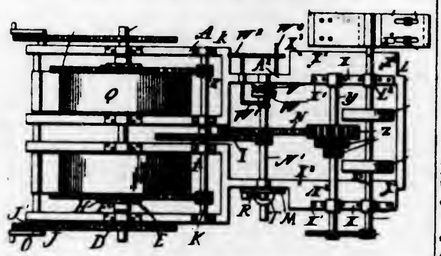
812,458. KEY-RING. ARTHUR R. SEE, Alma, Ill. Filed Jan. 14, 1905. Serial No. 241,213.

Claim.—1. A key-ring having one of its ends provided with a projection and an opening or recess, and its other end provided with

a projection constructed to enter said opening or recess, and also provided with a groove and a recess constructed to accommodate said first-mentioned projection, substantially as described.

2. A key-ring having overlapping end portions formed half round, a recess in each of said end portions, and a projection on each of said end portions arranged to enter the said recess in each overlapping portion, substantially as described.

812,459. **MOTOR FOR CHURNS, PUMPS, &c.** JOHN H. SKINNER, Angus, N. Mex. Filed Mar. 17, 1905. Serial No. 250,055.

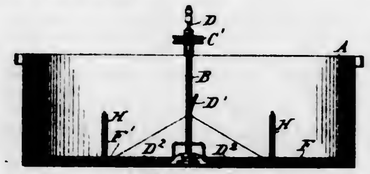


Claim.—1. A motor apparatus for operating churns, &c., comprising a series of intermeshing gear-wheels, a spring for operating the same, horizontally-adjustable bearing-plates mounted upon the frame of the apparatus, a shaft mounted in said plates, graduated gear-wheels fixed to said shaft, means for adjusting said plates, and clutch mechanism for throwing the apparatus into and out of operation, as set forth.

2. A motor apparatus for operating churns, &c., comprising a frame, a spring-power-actuated shaft, a train of intermeshing gear-wheels, a shaft mounted in suitable bearings and adapted to be connected to the handle of a churn, a clutch member splined to said shaft, an angle-bar pivotally connected to said clutch member, and a lever pivotally connected to said bar and to said frame, a fixed clutch member upon the frame adapted to be engaged by said sliding clutch, horizontally-adjustable plates mounted upon the frame of the apparatus, a shaft carried by said adjustable plates, and graduated wheels rotating with said shaft which is mounted upon the adjustable plates, as set forth.

3. A motor apparatus for operating churns, &c., comprising a train of gear-wheels, a spring-bar for actuating the same, means for throwing the device into and out of operation, horizontally-adjustable plates mounted upon the frame of the apparatus, a shaft carried by said plates, graduated gear-wheels upon said shaft, a second shaft mounted upon said plates and connections between the same and the shaft carrying said graduated wheels, said second wheel having an end projecting beyond the edges of the frame, and a longitudinally-movable bearing in which said projecting end is mounted, as set forth.

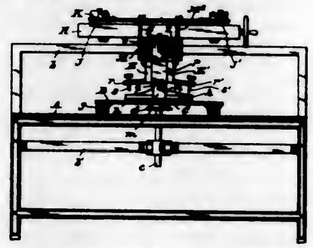
812,460. **AGITATOR FOR CYANID SOLUTIONS.** HENRY P SMITH and FRANCIS J. HOBSON, Guanajuato, Mexico. Filed Aug. 15, 1905. Serial No. 274,306.



Claim.—1. In an apparatus for the treatment of ores, a tank and a shaft rotating in the tank, stirrer-arms connected to and operated by the shaft, guides upon the arms, pipes carried by the arms and movable in the guides, and a flexible hose connecting the pipes to a source of compressed air.

2. In an apparatus for the treatment of ores, a tank and a shaft rotating therein, stirrer-arms operated by the shaft, pipes carried by the stirrer-arms, and means for supplying the pipes with compressed air; such means permitting the removal of the pipes from the solution in the tank at desired times.

812,461. **MACHINE FOR SHAPING CHAIR-LEGS FOR ROCKERS.** HARRISON L. STALEY, Martinsville, Ind., assignor to The Old Hickory Chair Company, Martinsville, Ind., a Corporation of Indiana. Filed July 31, 1905. Serial No. 272,116.



Claim.—1. A shaping-machine including a chuck comprising a body, a pair of cross-heads mounted slidingly on the body, arms pivoted on the cross-heads and having each a pair of jaws mounted thereon for holding a chair by its legs, means for controlling the cross-heads, and cutters for shaping the ends of the chair-legs.

2. A shaping-machine including a frame supporting rotative cutters, a truck mounted movably on the frame, a turn-table mounted on the truck, a carriage mounted movably on the turn-table, a chuck pivoted on the carriage and having means for holding a chair, and a gage arranged relatively to the cutters to be engaged by legs of the chair.

3. A shaping-machine including a frame supporting rotative cutters, a truck mounted movably on the frame, a turn-table mounted on the truck and having a tilting upper part, a carriage mounted movably on the tilting upper part of the turn-table, a chuck pivoted on the carriage for holding a chair, and a gage arranged with respect to the cutters to be engaged by legs of the chair.

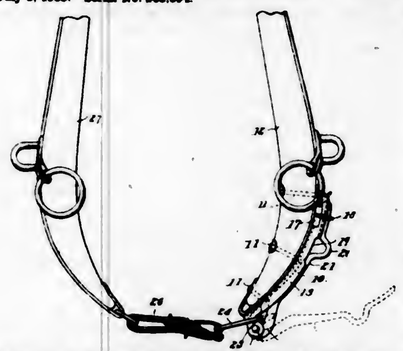
4. A shaping-machine including a frame having a pair of track-rails mounted thereon, a truck having wheels mounted on the track-rails, a turn-table pivoted on the truck, a movable latch for holding the turn-table against rotation on the truck, a carriage mounted slidingly on the turn-table, a pair of gage-bars mounted adjustably on the turn-table, a chuck pivoted on the carriage for carrying a chair by its legs to the gage-bars, and rotative cutters for shaping the ends of the chair-legs to receive rockers.

5. A shaping-machine including a frame, a pair of track-rails mounted on the frame, a truck having wheels mounted on the track-rails, a turn-table part pivoted to the truck, a latch for the turn-table part, a pair of guide-bars connected together and pivoted on the turn-table part and comprising a tilting part of a turn-table, adjusting devices for limiting the movements of the tilting part of the turn-table, a pair of gage-bars mounted in arms that are adjustably supported by the tilting part of the turn-table, a carriage supported slidingly by the pair of guide-bars that comprise the tilting part of the turn-table, a chuck pivoted on the carriage for supporting a chair with a pair of its legs against one of the gage-bars, and rotative cutters for shaping the ends of the chair-legs.

6. A shaping-machine including a frame comprising a main part supporting a pair of track-rails and also a rear upright part extending upwardly from the main part, a rotative shaft carrying cutters and mounted on the upright part of the frame, a truck mounted upon the track-rails, a turn-table pivoted upon the truck, a latch for the turn-table, a carriage mounted movably on the turn-table, a chuck pivoted on the carriage and comprising a body part having a pair of arms mounted movably thereon and each provided with a pair of jaws supported adjustably thereby, means for operating the arms, means for equalizing the pressure between all of the jaws of the arms collectively against chair-legs to be held thereby, and a gage-bar arranged with respect to the cutters to be engaged by chair-legs to be held by the jaws.

7. A shaping-machine including a frame provided with a pair of track-rails, a rotative shaft mounted on the frame and carrying a cut-off saw and a wabble-saw, a wheeled truck mounted on the track-rails, a turn-table pivoted upon the truck, a latch for the turn-table, a carriage mounted movably on the turn-table, a chuck pivoted on the carriage and comprising a body part having a screw mounted rotatively thereon, a pair of nuts mounted on the body part and engaged by the screw, and arms pivoted on the nuts and provided each with a pair of jaws having V-shaped engagement-fronts; a pair of gage-bars for gaging the movements of the chuck with respect to the saws, and means for tilting the chuck relatively to the saws.

812,462. **HAME-FASTENER.** JACOB STEGE, Arden, Nebr. Filed July 3, 1905. Serial No. 268,094.



Claim.—1. A device of the class described comprising a plate having means for attachment to a hame member and with spaced longitudinal ribs forming a channel lengthwise of the plate and with spaced ears extending laterally from said ribs at one end, a lever member having a hook at one end movably connected between said ears by a pin passing through the same and also through said hook at its bend, and bearing upon said plate between said ribs, and means for detachably connecting the free end of the lever to the plate.

2. A device of the class described comprising a plate having means for attachment to a hame member and with spaced longitudinal ribs forming a channel lengthwise of the plate and with spaced ears extending laterally from said ribs at one end, and with a transverse recess in said plate opening against the hame member, a coupling element movably engaging said recess, a lever member having a hook at one end movably connected between said ears by a pin passing through the ears and also through the hook at its bend and detachably coupled to the plate at its free end by said movable coupling element.

812,463. **MANUFACTURE OF VEGETABLE STRIPS.** FERNAND STOFFEL, Paris, France. Filed Oct. 14, 1904. Serial No. 228,297. (Specimens.)

Claim.—1. The process of making a ribbon or thin flat strip from threads, which consists in interlacing a number of such threads loosely together to form a braid, mashing and spreading said threads to flatten the braid and fill the voids between the threads and cementing the whole together.

2. The process of making a ribbon or thin flat strip from threads, which consists in interlacing a number of such threads loosely together to form a braid, softening the threads, mashing and spreading the threads to flatten the braid and fill the voids between the threads and cementing the whole together.

3. A ribbon or thin flat strip formed of threads interlaced and cemented together, and spread out within the spaces between the adjacent threads, so as to fill said spaces and to make the ribbon substantially without voids in its width.

812,464. **OPTICAL INSTRUMENT.** AMBROSE SWASEY and GOTTLIEB L. FECKER, Cleveland, Ohio, assignors to The Warner & Swasey Company, Cleveland, Ohio, a Corporation of Ohio. Filed Nov. 3, 1905. Serial No. 285,685.

Claim.—1. In an optical instrument, a body portion provided with an opening and having opposite transverse walls, a holder having opposite walls arranged to engage said transverse walls, fastening means for removably securing the holder and body in a predetermined position, and optical elements carried by the holder and precisionized in the body by said fastening means.

2. In an optical instrument, a body portion provided with an opening having opposite transverse walls and also having longitudinal walls connecting the transverse walls, a holder arranged to close said opening and having its opposite end portions arranged to engage said opposite transverse walls of the opening, the holder having longitudinal edges connecting said walls on each side arranged to abut said longitudinal edges of the body portion, fastening means arranged to removably secure said holder in position with said edges in engagement, and optical elements carried by the holder and precisionized by said fastening means.

3. In an optical instrument, a tubular body portion offset to form two parts having parallel axes, the body portion being provided with an opening at the offset part having opposite transverse walls disposed parallel and also having longitudinal walls connecting the transverse walls, a holder having its opposite end portions arranged to engage said transverse walls of the body portion, and also having longitudinal edges on each side arranged to abut said longitudinal edges of the body portion, fastening means arranged to removably secure the holder with said end portions and said longitudinal edges in engagement, and optical elements carried by the holder and precisionized by said fastening means.

4. An optical instrument having a tubular body portion offset to form two parts having parallel axes, the body portion being provided with an opening at the offset part having opposite transverse walls, and a holder carrying optical elements and removably secured to the body at such opening, the holder having two faces engaging said opposite walls in the body to precisionize the optical elements in alinement with said axes respectively.

5. An optical instrument having a tubular body portion offset to form two parts having parallel axes, the body portion being provided with an opening at the offset part having opposite transverse walls disposed parallel, and a holder carrying optical elements and removably secured in the body at such opening, the holder having opposite parallel sides engaging said opposite walls in the body to precisionize the optical elements in alinement with said axes respectively.

6. In an optical instrument, a body portion provided with an opening having opposite transverse walls, a holder having a segmental portion arranged to close said opening and provided with opposite transverse walls engaging said walls of the body, a transverse wall carried by the segmental portion and extending into the body, fastening means between said engaging portions of the holder and body, and prisms carried solely by said holder portion and precisionized in the instrument by said engagement of the holder and body.

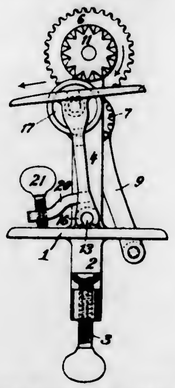
7. In an optical instrument, a body portion provided with an opening having opposite transverse walls, a holder having a segmental portion arranged to close said opening and provided with opposite transverse walls engaging said walls of the body, a transverse wall carried by the segmental portion of the holder and extending into the body, fastening means between said engaging portions of the holder and body, and prisms carried on opposite sides of said wall and precisionized in the instrument by said engagement of the holder and body.

8. In an optical instrument, a body portion provided with an

opening having opposite transverse walls, a holder having a segmental portion arranged to close said opening and provided with opposite transverse walls engaging said walls of the body, a transverse wall carried by the segmental portion of the holder and extending into the body and engaging its inner face, fastening means between said engaging portions of the segment and body, fastening means between the body and transverse wall of the holder, and prisms carried solely by said holder portions and precisionized in the instrument by said engagement of the holder and body.

9. In an optical instrument, a body portion provided with an opening having opposite transverse walls, and also having longitudinal walls connecting the transverse walls, a holder having a segmental part arranged to close said opening and having its opposite end portions arranged to engage said opposite transverse walls of the opening, the segmental part having longitudinal edges on each side arranged to abut said longitudinal edges of the body-opening, fastening means securing said holder to the body, a transverse wall on the segmental part of the holder extending into the body and having three openings therein, the wall having a recess in one face including two of such openings, a prism seated in such recessed portion, a post secured to such wall, a strip secured to such post and retaining said prism in position, a recess on the opposite face of the wall including two of said openings, a prism seated in the latter recess, and a strip having its ends secured in the segmental part and retaining the latter prism in position.

812,465. **PINKING-MACHINE.** PARKER H. SWEET, New York, N. Y., assignor to The Rotary File and Machine Company, Brooklyn, N. Y., a Corporation of New York. Filed Mar. 17, 1905. Serial No. 250,685.



Claim.—1. In a pinking-machine the combination of a cutting-roll and an anvil having their centers vertically out of alinement and means for maintaining a relatively constant pressure therebetween.

2. In a pinking-machine the combination of a cutting-roll and an anvil-roll having their centers vertically out of alinement and means for automatically adjusting the resistance of the latter to abnormally varying pressures.

3. In a pinking-machine the combination of a cutting-roll and an anvil-roll normally contacting, the former journaled in a fixed support, and the latter in a pivotally-mounted yielding support, the two supports mounted upon a common base, said pivot being in vertical alinement with the center of said cutting-roll, the center of the said anvil-roll being in the same plane without said alinement.

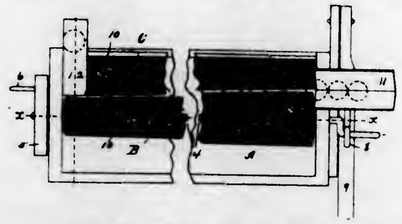
4. In a pinking-machine the combination of a cutting-roll and an anvil-roll normally contacting, the former journaled in a fixed support, and the latter on a pivotally-mounted yielding support, said pivot being in vertical alinement with the center of said cutting-roll but the said anvil-roll being in the same plane but without said alinement, together with means for adjusting said anvil-roll with respect to said alinement.

5. In a pinking-machine the combination of a cutting-roll rotatably mounted upon a fixed support; an anvil-roll carried upon a slidably-inclined table, supports to said table of slightly-elastic material, an arm projecting substantially horizontally from said supports, and an adjustment-screw passing through the extremity of said arm and against the base, substantially as and for the purposes set forth.

6. In a pinking-machine the combination of the bed-plate 1, the standard 4, the clamp 2, the set-screw 3, the gear-wheel 6, meshing with the geared driving-wheel 7, the crank 9, the cutting-roll 11, attached by a left-hand thread to the shaft 26, the anvil-roll 17, mounted upon the table 14, the table-support 15 15, pivotally connected by cylindrical projections upon the said bed-plate, the adjustment-arm 20, the adjustment-screw 21, the anvil-roll support being of such length that it normally contacts with the cutting-roll at a point without the perpendicular line from the center of the cutting-wheel to the base.

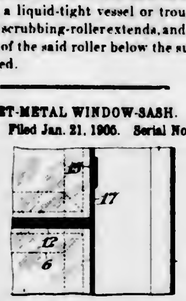
7. In a pinking-machine the combination of a cutting-roll rotatably mounted upon a fixed support, a slightly-inclined hollow table attached to said support, an anvil-roll mounted upon a sliding carriage within said hollow table, screw and spring means for adjusting the position of said carriage and anvil-roll and for compensating for abnormal pressures, the said cutting and anvil rolls normally contacting at a point slightly without the perpendicular line from the center of the cutting-roll to the base, substantially as described.

812,466. **SCRUBBING-MACHINE FOR REMOVING FOREIGN MATTER FROM THE SURFACES OF GLOBULAR OBJECTS.** ALVIN TAPLIN, Forestville, Conn. Filed Aug. 23, 1904. Serial No. 221,762.



Claim.—The combination of a frame with a tapering scrubbing-roller mounted on the said frame with its axis on an incline and with its under face level, a liquid-tight vessel or trough into which the under face of the said scrubbing-roller extends, and a scrubbing-apron arranged by the side of the said roller below the summit thereof substantially as described.

812,467. **SHEET-METAL WINDOW-SASH.** JOHN W. WATKINS, Philadelphia, Pa. Filed Jan. 21, 1905. Serial No. 242,176.



Claim.—1. In a sheet-metal window-sash, a muntin-support consisting of a flexible piece secured to the munnion (or side rail) and having its free end projected to pass under and support the muntin, substantially as set forth.

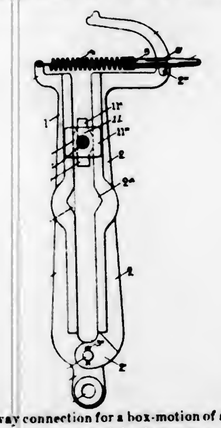
2. In a sheet-metal window-sash an adjustable muntin-support secured to the munnion (or side rail) and bent to reach the top of the pane and then bent out aong the top of the pane to afford a support for the muntin which rests on top of the pane, substantially as set forth.

3. In a sheet-metal window-sash, a muntin-support consisting of a piece of metal attached to both the munnion and the muntin, and bent so as to support the muntin at its juncture with the munnion at the proper height to accommodate the pane below it, substantially as set forth.

4. In a sheet-metal window-sash, a muntin-support consisting of a flexible strip passing through the partition between the pane-grooves of the munnion, and passing under the extremities of the muntins when they abut against the munnion on either side, substantially as set forth.

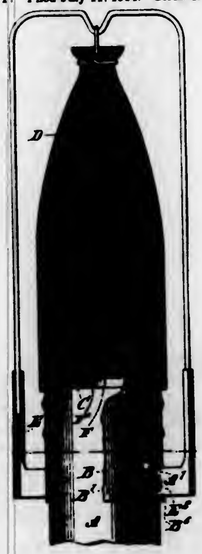
812,468. **GIVE-WAY CONNECTION FOR BOX-MOTIONS OF LOOMS.** WILLIAM WATTIE, Worcester, Mass., assignor to Crompton & Knowles Loom Works, a Corporation of Massachusetts. Filed Nov. 2, 1904. Serial No. 231,050.

Claim.—1. In a give-way connection for a box-motion of a loom, the combination with a box-operating rod having a screw-thread portion thereon, a collar loosely mounted on said rod, and adjustable thereon through nuts turning on said screw-thread portion, and said collar having a stud extending out from one side thereof, and a block mounted on said stud, and said block of non-circular shape at itscentral part, of two arms or levers pivotally connected together and yieldingly drawn toward each other, and one or both of said arms of levers having a non-circular recess or depression in its inner edge, adapted to receive and yieldingly hold the non-circular portion of said block.



2. In a give-way connection for a box-motion of a loom, the combination with a box-operating rod having a screw-thread portion thereon, a collar loosely mounted on said rod and adjustable thereon through nuts turning on said screw-thread portion, and said collar having a stud extending out from one side thereof, and a block mounted on said stud, and said block of non-circular shape at its central part, and having its upper and lower ends of reduced diameter, and having lips or wings extending beyond the central portion, of two arms or levers pivotally connected together, and yieldingly drawn toward each other, and one or both of said arms or levers having a non-circular recess or depression in its inner edge, adapted to receive and yieldingly hold the non-circular portion of said block.

812,469. **INCANDESCENT GAS-BURNER.** ELIAS R. WILNER, New York, N. Y. Filed July 11, 1904. Serial No. 216,007.



Claim.—1. In a holder for incandescent mantles, a sleeve having a longitudinal joint, sockets secured to said sleeve and adapted to receive a mantle-carrier, one of said sockets bridging the said joint of the sleeve.

2. In a holder for incandescent mantles, a sleeve having a longitudinal joint and provided with apertures at each side of said joint and in combination with a socket having lugs, the ends of which are bent through the said apertures so that said socket will contribute to join the edges of the sleeve.

3. In a holder for incandescent mantles, a sleeve having a longitudinal joint and apertures at each side of said joint, combined with a mantle-carrying socket bridging said joint and having laterally-projected lugs with ends of reduced width, the said ends being passed through the said apertures and clenched on the inside of the sleeve so as to be substantially flush therewith, while the outer surfaces of the lugs are provided with bulges or projections corresponding in shape and location to the said clenched ends.

4. In a holder for incandescent mantles, a tubular support having a screen at its outlet, in combination with a spreader secured to said screen peripherally by prongs.

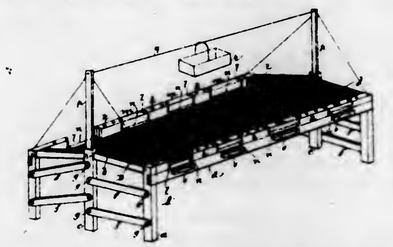
5. In a holder for incandescent mantles, a sleeve having longitudinal meeting edges, and a socket adapted to receive a mantle-carrier and secured to said sleeve at each side of said meeting edges so as to bridge the joint of the sleeve.

6. In a holder for incandescent mantles, a sleeve having longitudinal meeting edges, and a socket adapted to receive a mantle-carrier and having at its lower end an attaching portion extending transversely of said meeting edges and secured to the sleeve at each side of the joint.

7. In a holder for incandescent mantles, a tubular support having a screen at its outlet, in combination with a spreader the periphery of which is secured to said screen.

8. In a holder for incandescent mantles, a sleeve having a longitudinal joint, in combination with a mantle-carrying socket, one of said parts being provided with apertures and the other of said parts having lugs passing through the said apertures and secured therein so that said socket will contribute to join the edges of the sleeve.

812,470. **FRUIT-SORTER.** THEODOR N. WOOLVERTON, Grimsby, Canada. Filed Feb. 25, 1905. Serial No. 247,231.



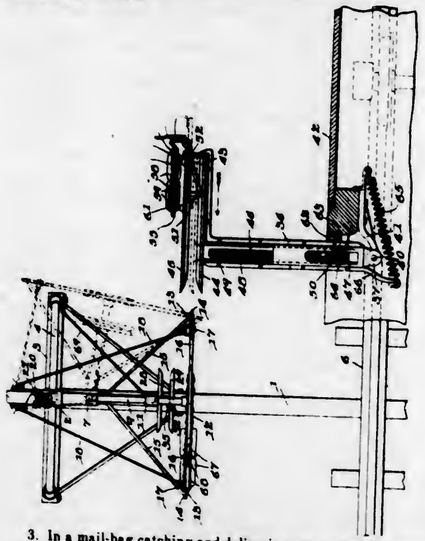
Claim.—In a fruit-sorter, a rectangular frame, supported by six legs, the legs at each end connected with pivoted braces so as to be capable of folding, a longitudinal centerpiece connecting the ends higher than the sides, a woven material covering the top of the frame, sloping to the sides and form fruit-pockets, a series of blocks secured to the sides at intervals to form raised sides for the pockets, a series of openings between said blocks, a series of removable gates to fit in said openings, a series of lips at the bottom of each gate-opening, a series of cleats secured to the sides under each gate-opening, standards affixed to the ends of the frame, a rod made to connect said standards to carry a removable fruit-receptacle, all constructed, combined and arranged substantially as and for the purpose specified.

812,471. **MAIL-BAG CATCHER AND DELIVERER.** HENRY H. AKINS, Cherryvale, Kans., assignor to Ora Bleak Akins, Cherryvale, Kans. Filed Nov. 2, 1905. Serial No. 285,633.

Claim.—1. In a mail-bag catching and delivering apparatus, a car device mounted to swing horizontally into and out of the car, a spring-actuated bag-gripping jaw upon the car device, means to hold the jaw open, means to trip the jaw, means to hold the car device in its operative position, and means controlled by the jaw-holding means for releasing the car device.

2. In a mail catching and delivering apparatus, the combina-

tion with a car, of a horizontally-swinging car device, a spring-pressed jaw carried by the device, means to hold the jaw open, means to trip the jaw-holding means, a catch carried by the car, a keeper upon the car device for engagement with the catch, means controlled by the jaw-holding means for releasing the catch from the keeper, and means to automatically swing the car device into the car when the catch is released.



3. In a mail-bag catching and delivering apparatus, the combination with a support, of a horizontally-swinging crane having a movable jaw, a spring connected to the jaw and the crane, a lever for moving the jaw against the pressure of the spring, means for holding the jaw open, means to trip the jaw-holding means, a catch engaging the crane and the support to hold the former in its operative position and located in the path of the lever to be tripped thereby, and means to automatically swing the crane from its operative position when the catch is released.

4. In a device of the class described, the combination of a car device, a stationary device, a pair of tensioned jaws carried by one of the devices, a catch to hold the jaws open, a bag-holder carried by the other device, and a guard carried by said other device for engagement with the bag to prevent swinging thereof, a portion of the jaw-holding means being disposed in the path of the guard to be tripped thereby.

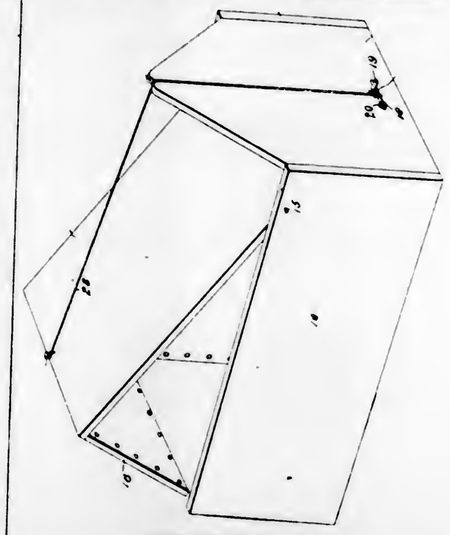
5. In a device of the class described, the combination of a stationary device, a fixed jaw and a spring-actuated jaw carried thereby, a bracket projected in advance of the movable jaw, a catch pivoted upon the bracket and capable of being engaged with the movable jaw to hold the same open, a car device, a bag-holder carried thereby, and a substantially U-shaped spring-clamp hung from the car device for embracing the bag, a portion of the catch being disposed in the path of the clamp for automatically releasing the spring-actuated jaw.

6. In an apparatus of the class described, the combination of a crane, opposite bag-holding means upon the crane and including removable elements, a counterweight, and cables connected to the counterweight and the respective removable elements to normally hold the weight elevated, said weight capable of swinging the crane to one side when either of the removable elements is removed.

7. In an apparatus of the class described, the combination with a frame, of a crane mounted upon the crane to swing upon a vertical axis, opposite bag-holding means carried by the crane, a counterweight movable vertically upon the frame, removable elements included in the bag-holding means, guides upon opposite sides of the frame, and cables connected to counterweights and running through certain of the guides to the respective removable elements.

812,472. ANIMAL-TRAP. JAMES C. ALSOBROOK, Sorrento, Fla. Filed Dec. 1, 1905. Serial No. 289,942.

Claim.—A trap comprising a receptacle closed at one end and with an aperture through the closed end, a stop spaced from the aperture, a swinging closure to said receptacle, a rod projecting through said aperture and with means at the inner end for supporting the bait, a bar disposed transversely beneath said stop and the projecting end of the bait-rod, and a trip-cord connected at one end to said bar and at the other end to the free end of said movable closure.



812,473. PROCESS OF TREATING ORES. ERNEST W. ARNOLD, San Francisco, Cal., assignor of one-half to Victor Seina, San Francisco, Cal. Filed Sept. 14, 1905. Serial No. 278,376.

Claim.—1. The treatment of refractory ores which comprehends the roasting of the ore to incandescence, and the direction of a blast impregnated with chlorin gas against and into the body of ore, while in an incandescent state.

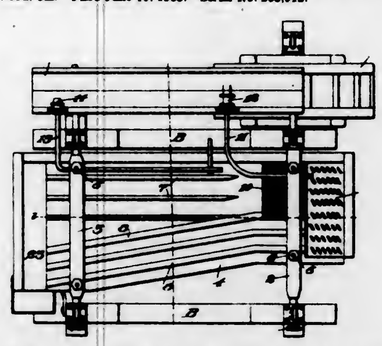
2. The treatment of refractory ores which comprehends the heating of the ore to incandescence, and the direction of a blast of chlorin gas and charcoal-fumes upon and into a body of ore, while the latter is in a state of incandescence.

3. The treatment of refractory ores which comprehends heating the ore to incandescence by directing a blast of a suitable hydrocarbon thereagainst, and then impregnating the incandescent ore with chlorin gas.

4. The treatment of refractory ores which comprehends heating the ore to incandescence and while it is in motion by directing a blast of a suitable hydrocarbon into and against said ore, and then impregnating the incandescent ore with a mixture of chlorin gas and charcoal-fumes.

5. The treatment of refractory ores which comprehends the heating of a body of ore to incandescence by directing into and against the ore a blast of a suitable hydrocarbon, and impregnating the incandescent ore with a mixture of chlorin gas and charcoal-fumes, in the proportion of about two parts of chlorin to one part of charcoal-fumes.

812,474. GOLD-SAVING APPARATUS. OLIN H. BAGLEY, Deadwood, Cal. Filed June 19, 1905. Serial No. 265,912.



Claim.—1. A gold-washer comprising a table suitably mounted for reciprocatory movement, said table having a generally straight back portion with closed back and ends and opened at the front, the front edge of the table made divergent toward the rear of the table, whereby the latter has a generally flared appearance from front to rear, a series of riffles on the surface of the table extending approximately parallel with the front divergent edge of the table, means for delivering material onto the head or narrower end of the table, means for giving the table a longitudinal reciprocating movement, said table having its surface slightly higher at the center than at either side, and means for adjusting the transverse tilt of the table.

2. A concentrator-table, suitably mounted for reciprocatory movement and having a generally straight back portion with closed back and ends, and open at the front, the front edge of said table being divergent relative to the back whereby the table has a generally flared appearance from front to rear, riffles on one part of the table extending generally parallel with the back of the table, other riffles extending generally parallel with the flared front edge of the table, means for delivering material onto the several riffled portions of the table, and means for giving the table a reciprocatory movement in a line parallel with the back of the table.

3. A concentrator-table, having substantially a straight back edge and a longer front edge, and closed at the back and ends and open at the front, said table having its surface slightly higher at the center than at either side, riffles on the table, some of which riffles are arranged divergent with relation to the back edge, means for imparting a transverse tilt to the table, and a transversely-extending discharge-trough for the concentrates at the wider end.

4. In a gold-saving apparatus, the combination of a suspended table, means for reciprocating the same lengthwise, riffles on the table, means for tilting the table sidewise, means for delivering material and wash-water to the table, a power-shaft, a cam on said shaft, a tappet carried by the table, and means including transversely-extending screws engaging the side of the table whereby the table may be shifted laterally into and out of the range of action of the cam.

5. In a gold-saving apparatus, a table suspended for reciprocatory movement, riffles on the table, means for delivering material and wash-water thereto, a power-shaft, a cam on the power-shaft, a tappet carried by the table, means for shifting the table laterally to carry said table into or out of the path of said cam, said means including adjustable screws bearing on the side of the table and proximate to the head and rear thereof.

6. In a gold-saving apparatus, the combination of a frame, two rock-shafts journaled therein, one of which has a limited lengthwise movement, adjustable hangers carried by said rock-shafts, a table supported by said hangers, means for delivering material and wash-water to the table, means for collecting the values separate from the worthless matter, and means for shaking the table, said shaking means capable of being thrown into and out of operative relation with the table by means of said endwise-movable shaft.

7. In a gold-saving apparatus, the combination of a suitable framework, a table mounted thereon for reciprocatory movement, means for delivering material and wash-water onto the table, means for shaking the table, and means for collecting the values separate from the worthless material, said means for delivering the material onto the table including a V-shaped trough, a discharge-pipe for the material opening into the bottom of said trough, and a plate sliding in suitable guides on the inside of the trough and having a V-shaped portion corresponding to the cross-section of the V-trough to control the passage of material into said discharge-pipe.

8. In a gold-saving apparatus, the combination of a suitable framework, a table mounted thereon for reciprocatory movement, means for delivering material and wash-water onto the table, means for shaking the table, and means for collecting the values separate from the worthless material, said means for delivering the material to the table including a V-shaped trough, a discharge-pipe for the material opening into the bottom of said trough, and a plate sliding in suitable guides on the inside of the trough and having a V-shaped portion corresponding to the cross-section of the V-shaped trough to control the passage of material into said discharge-pipe, a pipe for said wash-water entering said V-shaped trough at a point above the ordinary level of the material in said trough, a suitable gate for the wash-water pipe and an overshot wheel receiving the overflow from said trough and operating said table-shaking means.

9 In a gold-saving apparatus consisting of a framework, two rock-shafts thereon, one of which is arranged to have a limited lengthwise movement, a table suspended from said rock-shafts, said table closed on one side and two ends, and open on the other side, said table being narrower at one end than at the other, a perforated feed-trough extending across the narrower end, a screen arranged beneath a portion of said feed-trough and adapted to calm the water and material passing from the feed-trough onto that portion of the table, means for delivering material and water into the feed-trough, and means for shaking the table.

10. In a gold-saving apparatus, the combination of a suitable framework, two rock-shafts mounted thereon, one of which is adapted to have a limited lengthwise movement, a table adjustably hung from said rock-shafts, said table being closed on one side and at both ends, and open at the front, said table also being narrower at one end than at the other, means for delivering material at the narrower end of the table, a water-wheel, a shaft provided with a cam, a tappet on the table to be engaged by the cam, means for shifting the table and said lengthwise-shiftable rock-shaft to carry said tappet into and out of engagement with the cam, and a V-shaped trough, carrying the material which is delivered onto the table, discharging upon said water-wheel.

812,475. BOAT-PROPELLER. CHARLES E. BARBER, Syracuse, N. Y. Filed Apr. 1, 1905. Serial No. 253,216.

Claim.—1. In a boat-propeller, the combination of a rotary shaft suitably sustained against endwise movement, a propeller-wheel comprising a hollow hub mounted on said shaft and a plurality of radially-disposed blades pivotally and detachably secured to said hub, a block sliding longitudinally on the shaft within the hub for turning the blades to either propelling or reversing positions, a longitudinally-shiftable sleeve embracing the shaft, means adjustably connecting the block to said sleeve and transmitting motion from the latter to said block, and means for shifting said sleeve as set forth.

2. In a boat-propeller, the combination of a rotary shaft suitably sustained against endwise movement, a propeller-wheel comprising a transversely-divided hollow hub having the shaft extending beyond the same and provided with radial openings at the line of division, and blades detachably and pivotally secured in said openings, the inner section of the hub being permanently secured to the shaft and the outer section removably secured thereon, a block sliding longitudinally on the shaft within the hub and provided with projections engaging the blades for turning the latter to either propelling or reversing positions, a longitudinally-shiftable sleeve embracing the shaft in front of the hub, adjustable means for transmitting motion from the sleeve to the block, and means for shifting the sleeve as set forth.

3. In a boat-propeller, the combination of a rotary longitudi-

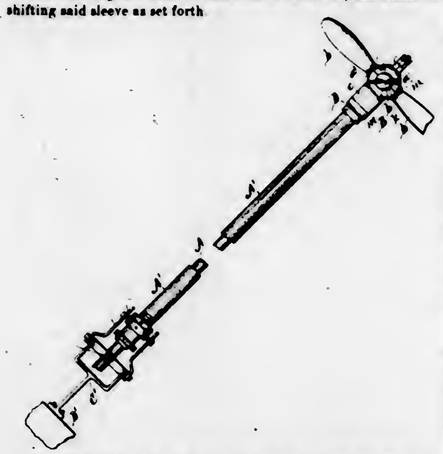
nally-disposed shaft suitably sustained against endwise movement, a propeller-wheel comprising a hollow hub mounted on the shaft and divided transversely to form two sections and provided with a plu-

2. The combination of a door and its frame of a rack-bar secured to one of said parts, a pivot spring-pressed latch mounted upon the other part and designed to engage in the teeth of said rack-

the track-rail, and formed with a head at its upper end provided with lateral ribs or lugs adapted to engage in said opening in the main part of the hanger and lock the same in connection with the track-

21. In combination with the track rail or way, a clamping or binding device formed with an upward extension or head provided with side lugs or ribs and a horizontal extension or lug above the

sally-disposed shaft suitably sustained against endwise movement, a propeller-wheel comprising a hollow hub mounted on the shaft and divided transversely to form two sections and provided with a plurality of radial openings at the line of division, and blades pivotally and detachably secured in said openings, the inner hub-section being permanently fastened to the shaft and provided with a series of longitudinal guides, and the outer hub-section secured removably on the shaft, a block sliding longitudinally on the shaft within the hub and provided with means for turning the blades axially to either propelling or reversing positions, a longitudinally-shiftable sleeve embracing the shaft independent of the hub, and rods extending through the aforesaid guides and adjustably connecting the block to the sleeve and transmitting motion from the latter to the block, and means for shifting said sleeve as set forth



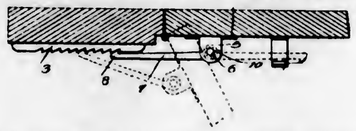
4. In a boat-propeller, the combination of a longitudinally-disposed rotary shaft suitably sustained against endwise movement and having its rear end screw-threaded, a propeller-wheel comprising a hollow hub provided with a plurality of radial openings and divided transversely on a line diametrically through the openings, the inner section being permanently secured to the shaft and the outer secured removably thereon and having the threaded portion of the shaft projecting therefrom, a nut on said shaft and sustaining the outer section in its position, and blades formed with stems by which they are pivotally and detachably secured in the aforesaid openings and provided with bearing-surfaces formed on the exterior and interior of the hub, a longitudinally-sliding block on the shaft within the hub and engaging the stems of the blades, means for adjusting the block to regulate the movement of the blades, and means for actuating said block as set forth.

5. In a boat-propeller, the combination of a rotary shaft sustained against endwise movement, a propeller-wheel comprising a hollow hub divided transversely to form inner and outer sections, the inner section being formed with a tubular portion by which it is permanently secured to the shaft, and the outer section being removably secured thereto, longitudinal guides in said tubular portion, a triangular block provided with a central aperture by which it slides longitudinally on the shaft within the hub and provided with additional apertures at the corner portions thereof, a longitudinally-shiftable sleeve embracing the shaft and formed with a collar adapted to abut against the tubular portion of the hub, rods passing through the aforesaid guides and having their rear ends screw-threaded and extending through the corner apertures of the block, nuts on said rear ends of the rods, the opposite ends of the rods being screw-threaded and fastened to the said collar, and means for shifting said sleeve as set forth.

812,476. **DOOR-HOLDER.** JOHN BECKER, Wichita, Kans. Filed Oct. 14, 1905. Serial No. 282,787.

Claim.—1. The combination with a door and its frame, of a rack-bar secured to one of said parts and a spring-pressed latch mounted upon the other of said parts and pivotally connected thereto so as to move in a plane coincident with the plane of movement of the door and designed to engage with any one of the teeth of said rack-bar whereby to hold the parts in different angular relation with respect to each other.

2. The combination of a door and its frame of a rack-bar secured to one of said parts, a pivot spring-pressed latch mounted upon the other part and designed to engage in the teeth of said rack-bar, and a detent attached to that part which carries the latch and designed to engage the latter to hold it in an inoperative position.



3. The combination with a door and its frame, of a rack-bar secured to one of said parts, a pivoted spring-pressed latch mounted upon the other part and designed to engage in the teeth of said rack-bar and a spring-detent attached to that part which carries the latch and provided with a hook in the path of said latch whereby the latter may be held in inoperative position.

4. The combination of a door and its frame, of a rack-bar secured to one of said parts, a bracket secured to the other of said parts and provided with spaced-apart ears, a latch pivotally mounted between said ears at one end and provided at the other end with a hook designed for engagement with said rack-bar a spring tending to spring said latch into engagement with said teeth, and a detent secured to the part that carries the latch and its bracket said detent extending outwardly from its attached part and thence downwardly and upwardly at its extremity which latter lies in the path of the latch, whereby the latter may spring underneath the extremity of the detent and be held thereby in inoperative position.

812,477. **SUSPENDED TRACK FOR ELEVATORS AND CARRIERS.** JOHN M. BOYD, Fond du Lac, Wis. Original application filed Dec. 28, 1901, Serial No. 87,089. Divided and this application filed May 23, 1903. Serial No. 158,010.

Claim.—1. In a suspended track apparatus for elevators and carriers, in combination with a suitable track rail or way, a track-hanger provided with an upper extension by which it may be suspended, and formed at its lower end to engage with the track rail or way, a separate wedge or key adapted to key the same to said track rail or way to support said rail, and separate or independent means to secure said wedge or key in place endwise, substantially as and for the purposes set forth.

2. In combination with a suitable track rail or way, a track-hanger adapted to be suspended from a rafter-bracket or other support, and formed with an opening or channel through its body at or near the lower end to receive a wedge or key, a wedge or key adapted to engage in said opening and lock the hanger to the track-rail, and means to secure said wedge in place endwise, substantially as and for the purposes set forth.

3. In combination with a suitable track rail or way, a track-hanger formed with an upper extension by which it may be suspended, and an opening, channel, or key-seat, through its body parallel with the track-rail, and a suspending and clamping device adapted to engage with the track-rail, and formed with a head, wedge, or key, at its upper end adapted to engage in said opening or key-seat in the track-hanger proper, substantially as and for the purposes set forth.

4. In combination with the track rail or way, a track-hanger adapted to be connected with a support above the rail, and formed at its lower end to engage with the rail or way, and provided with an intermediate opening or key-seat through its body parallel with the rail, and a key or wedge adapted to engage in said opening and formed with a lower part or extension adapted to support and hold the rail or way in proper position in conjunction with the lower end of the main part of said track-hanger, substantially as and for the purposes set forth.

5. A track-hanger formed with means for connecting with an overhead support, and adapted to connect with a track rail or way at its lower end, and provided with an intermediate opening or key-seat parallel with the track, and a lower part adapted to engage with the track-rail, and formed with a head at its upper end provided with lateral ribs or lugs adapted to engage in said opening in the main part of the hanger and lock the same in connection with the track-rail, substantially as and for the purposes set forth.

6. A track-hanger formed with an upper or main part adapted to be connected with an overhead support, and a lower part adapted to engage the track-rail, and means whereby said upper and lower parts may be wedged or keyed together endwise to support the rail in proper position, substantially as and for the purposes set forth.

7. A track-hanger consisting of an upper supporting part adapted to engage with the rail at its lower end, a lower part adapted to engage with said upper part above the rail through its center, and lengthwise of the track, and hold the same in locked engagement with the rail, and extraneous means to prevent the disengagement of the parts by the rattle and jar of the track while in use, substantially as and for the purposes set forth.

8. A track-hanger formed with a hooked upper end to engage with a rafter-bracket or other support, a lower end adapted to engage with the track-rail, means for connecting said lower end in locked engagement with the track-rail, and a rod or link to connect said means with said hook and lock them both in place, substantially as and for the purposes set forth.

9. A track-hanger formed with a hooked upper end, and adapted to engage with the track-rail at its lower end, and provided with an opening or channel through its body adapted to receive a wedge or key, a wedge or key adapted to engage in said opening and clamp said hanger to the rail, and a rod or link adapted to lock said wedge in said opening and connect the same with the hook, substantially as and for the purposes set forth.

10. A track-hanger formed with an upper suspending part adapted to receive and support the upper end of a lower or clamping part, a lower part adapted to clamp or wedge said upper part to the track-rail, and a rod, key, or link, adapted to hold said upper and lower parts in proper connection with each other from endwise movement.

11. A track-hanger formed with an upper or suspending part, and a lower or clamping part formed with a head to engage in an opening in the upper part, said parts being adapted to wedge together to support the track from an overhead support, and means to hold the same in proper engagement with each other.

12. A track-hanger formed with an upper hooked part, a lower clamping part, said parts being adapted to wedge together to support the track-rail, and a rod or link adapted to hold or lock the same together endwise and to close the opening in the hook.

13. A track-hanger formed with an upper hooked part, a lower clamping part adapted to engage inside said upper hooked part, said parts being adapted to slide or wedge together lengthwise with the rail, and a rod or link adapted to hold the same together against an endwise movement, and to close the opening in the hook.

14. The track-hanger *h* formed with an opening through its center, and the clamping or supporting wedge *d'*, in combination with the track-rail T, and means for holding the same together against an endwise movement along the track.

15. The combination of the track-hanger *h* formed with a central channel, the clamping and supporting wedge *d*, the rod or link *r'*, and the track-rail T, substantially as and for the purposes set forth.

16. In combination with the track rail or way, a track-hanger adapted to support the rail, and provided with a guideway, or means to guide the attachment of the stop-block of a carrier in proper place at the side or sides of said hanger, substantially as set forth.

17. In combination with the track or way, a track-hanger adapted to support the track-rail, and provided with lugs or extensions at each side above the track to support a stop or trip block of a carrier, substantially as set forth.

18. In combination with a track rail or way, a clamping device formed in separate pieces provided with ribs or lugs adapted to fit into and engage with each other at their upper edges, above the rail, and means to hold the same together, substantially as set forth.

19. In combination with a track rail or way, a clamping device formed in separate parts provided with lateral extensions or lugs at or near their upper edges adapted to engage with each other at each side of the center of the track or way, and lower extensions adapted to engage and hold the track in position, and means whereby the same may be clamped together, substantially as and for the purposes set forth.

20. In combination with the track rail or way, a clamping device formed with upward extensions provided with lateral ribs or lugs adapted to engage with each other and be clamped together at each side of the center, cross extensions at each end, and means for holding the parts in engagement with each other, substantially as and for the purposes set forth.

21. In combination with the track rail or way, a clamping or binding device formed with an upward extension or head provided with side lugs or ribs and a horizontal extension or lug above the rail, and a wedge or clamp adapted to engage underneath said horizontal extension and said side lugs or ribs and clamp the same to the rail, substantially as and for the purposes set forth.

22. In combination with a suitable track rail or way, a clamping or binding device formed with a supporting part having an upwardly-projecting extension or head provided with lateral lugs or ribs above the track, and a clamping part formed with inwardly-projecting lugs or ribs, and a loop or cross-bar at each end, and adapted to be passed down over said head, and moved horizontally along said track-rail into locking engagement with said head, substantially as and for the purposes set forth.

23. In combination with the track-rail, a clamping and supporting device provided with lateral extensions, lugs, or ribs, lengthwise of and above the rail, and formed at the lower end to engage with the rail, and means whereby the same may be clamped to the rail underneath said lateral lugs or ribs, substantially as and for the purposes set forth.

24. In combination with a track rail or way, a clamping or binding device formed with a supporting part provided with an upper extension or head formed with side extensions, ribs, or lugs, and a projection n^7, and a clamping part provided with inwardly-projecting lugs or ribs n^8, n^4, adapted to engage with said side extensions or ribs on said head, and downward extensions adapted to engage and hold the rail, substantially as and for the purposes set forth.

25. In combination with a suitable rail or way adapted for a carrier to travel thereon, an end stop for said carrier adapted to be pivotally suspended from an overhead support above the track to prevent said carrier from leaving the track at the end, substantially as set forth.

26. In combination with a suitable rail or way adapted for a carrier to travel thereon, an end stop for said carrier adapted to hook into a support above the rail and adapted to catch and stop the carrier, substantially as set forth.

27. In combination with a suitable rail or way adapted for a carrier to travel thereon, and an overhead support for said rail or way, an end stop flexibly suspended from said overhead support directly above the rail and adapted to catch and stop the carrier, substantially as and for the purposes set forth.

28. In combination with the track or way adapted for a carrier to travel thereon, an end stop for said carrier formed in the shape of a loop into which the carrier-wheels will run, said loop passing preferably underneath the track and being connected to an overhead support, substantially as and for the purposes set forth.

29. In combination with the track rail or way, the rafter-bracket *r* and the loop or end stop r^3, substantially as and for the purposes set forth.

30. In a suspended track, in combination with the rail or way provided with an upper bead, a suspending hook or hanger formed with an opening through its body parallel with the rail, whereby it may be attached to the rail, and a hooked extension at its lower end adapted to engage underneath one side of the upper bead of the rail, and a supporting wedge or clamp adapted to engage in said opening to clamp said hanger to the rail, and provided with a lower extension or hook adapted to engage underneath the opposite side of the upper bead of the rail, substantially as and for the purposes set forth.

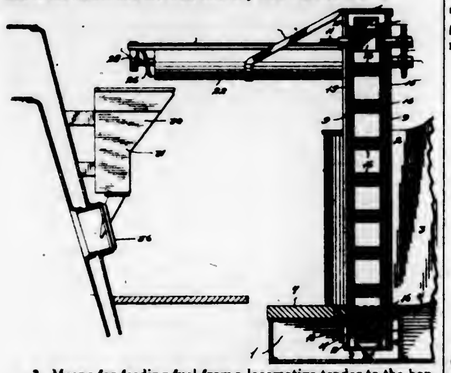
31. In a suspended track, in combination with the rail or way, hanger-hooks whereby said rail or way may be suspended, clamps whereby different sections of said rail may be spliced or clamped together, and the end stops suspended above the track-rail at each end, substantially as and for the purposes set forth.

32. In a suspended track for elevators and carriers, the combination of the track-rails, splices or clamps to connect said rails, track-hangers whereby said rails may be suspended from an overhead support, supporting wedges or keys to connect said hooks with said rails at suitable distances, and end stops or loops supported above said rails at each end of track, the whole constituting a complete suspended or swinging track, substantially as and for the purposes set forth.

812,478. **ELEVATOR AND CONVEYER.** MORRIS B. BREWSTER, Columbus, Ohio. Filed Mar. 6, 1905. Serial No. 248,718.

Claim.—1. The combination with a locomotive, a stoker for supplying fuel thereto and a locomotive-tender, of means for conveying fuel from the tender to the stoker, the delivery end of said means lying in juxtaposition to the stoker, but movable laterally with relation thereto.

2. The combination with a locomotive, a stoker for supplying fuel thereto and a locomotive-tender, of means for conveying fuel from the tender to the stoker, said means being mounted upon the tender centrally thereof and extending longitudinally overhead from the tender toward the locomotive with its delivery end in juxtaposition to the stoker and movable laterally with relation thereto.



3. Means for feeding fuel from a locomotive-tender to the hopper of a mechanical stoker carried on the locomotive, comprising a device for elevating the fuel up the side of the tender, and means for conveying the fuel overhead from the said device to the hopper of the stoker.

4. In a device of the character described, the combination with a stoker and a locomotive-tender, of means for elevating fuel up one side of the tender and partly across the same overhead, and a conveyer associated with the elevator and extending overhead therefrom to convey the fuel from the elevating means to the stoker.

5. The combination with a locomotive-tender and a stoker, of a grate located in the tender, means for elevating fuel from beneath the grate up one side of the tender, and a conveyer for conveying the fuel from the elevating means to the stoker.

6. The combination with a locomotive-tender and a stoker, of an elevator for carrying fuel from the bottom of the tender up one side and overhead across to the center of the same, and a conveyer supported centrally overhead from the elevator with its outer end in juxtaposition to the stoker and adapted to convey the fuel from the elevator to the stoker.

7. The combination with a locomotive-tender and a stoker, of an overhead conveyer having its discharge end adjacent the stoker, means for automatically elevating fuel from the tender and delivering it to the conveyer, means for imparting motion to the elevating means, and means for imparting motion to the conveyer.

8. The combination with a locomotive and its tender of a stoker carried upon the locomotive, a conveyer carried by the tender and extending from said tender to said stoker in a plane above the top of the tender and means for elevating fuel from the body of the tender and delivering the same to said conveyer.

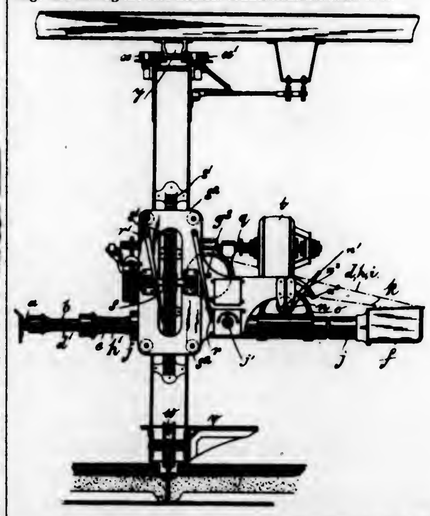
9. The combination with a locomotive and its tender, of a stoker carried upon the locomotive, a conveyer carried upon the tender and held rigidly in line therewith, said conveyer passing overhead from the tender to the stoker with its free and delivery end overhanging said stoker.

812,479. APPARATUS FOR DISCHARGING GAS-RETORTS. JOHN W. BROADHEAD and FRANCIS W. CROSSE, Hlmsd, England, assignors to Robert Dempster & Sons, Ltd., Hlmsd, England. Filed June 19, 1905. Serial No. 265,916.

Claim.—1. In a coke-drawing machine, the combination, with a supporting-carriage, of a casing-tube pivoted in the said carriage and provided with a loop, a telescopic ram carried by the said casing-tube, and an eccentric pivoted to the said carriage and engaging with the said loop and affording a means for turning the said casing-tube on its pivots.

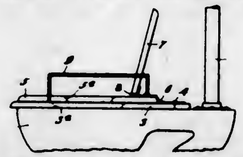
2. In a coke-drawing machine, the combination, with a supporting-carriage, and a casing-tube supported in the said carriage and provided with a tank for cooling-water; of a telescopic ram provided with spaces for cooling-water which communicate constantly with the said tank, and driving mechanism for telescoping the said ram and causing the cooling-water to move back and forth in the said water-spaces and tank.

3. In a coke-drawing machine, the combination, with a supporting-carriage, and a casing-tube supported in the said carriage and provided with a tank for cooling-water at its rear end; of a telescopic ram provided with spaces for cooling-water which communicate constantly with the said tank, guide-sheaves carried by the said ram, guide-sheaves journaled in the said tank, flexible connections operatively connected with the said ram and passing over the said guide-sheaves, and winding mechanism supported by the said carriage and having the said flexible connections attached to it.



4. In a coke-drawing machine, the combination, with a single lower rail, and a single upper rail, and means for holding the said rails in position; of a carriage provided with wheels for engaging the said rails, a telescopic ram supported by the said carriage, and driving mechanism for telescoping the said ram also supported by the said carriage.

812,480. CLOSET-BOWL SEAT. JOHN M. BRYANT and JAMES B. ALLEN, Detroit, Mich. Filed Mar. 6, 1905. Serial No. 248,410.

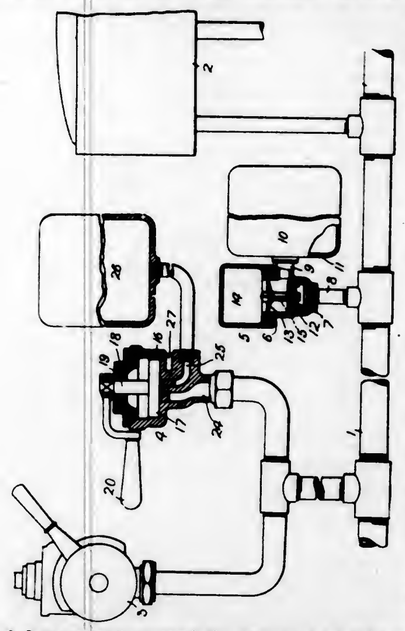


Claim.—1. The combination with a closet-bowl, of a main seat having a relatively large hole, a supplemental seat hinged thereto and having a relatively small hole, a cover hinged to said supplemental seat and adapted to be turned upward to form a seat-back, and side rails applied to said supplemental seat and movable into operative position when and only when said supplemental seat is moved into operative position, substantially as described.

2. The combination with a closet-bowl, of a main seat having a relatively large hole, a supplemental seat hinged thereto and having a relatively small hole, a cover hinged to said supplemental seat and adapted to be turned upward to form a seat-back, and folding side rails made up of sections pivotally connected with each other and pivotally attached, the one section to said supplemental seat and the other to said cover, substantially as described.

812,481. AUTOMATIC VACUUM-BRAKE. JOHN W. CLOUD, King's Cross, London, England. Filed June 21, 1905. Serial No. 266,242.

Claim.—1. In an automatic vacuum-brake apparatus for railway and like vehicles, a reservoir or receptacle normally containing air at atmospheric pressure, provided with means whereby when a sudden small increase of pressure is made in the train-pipe for applying the brakes, said reservoir or receptacle is put into communication with the brake system, so that a portion of the air contained in the reservoir or receptacle will be discharged into the brake system for the purpose of accelerating the application of the brakes.



2. In an automatic vacuum-brake apparatus, a reservoir normally containing air at atmospheric pressure, and a valve device operated by a small sudden increase in train-pipe pressure for opening communication from said reservoir to the brake system for accelerating the rise in train-pipe pressure and the application of the brakes.

3. In an automatic vacuum-brake apparatus, a reservoir having a restricted orifice communicating with the atmosphere, and a valve device operated by a small sudden increase in train-pipe pressure for opening communication from the reservoir to the train-pipe.

4. In an automatic vacuum-brake apparatus, a reservoir normally containing air at atmospheric pressure, and a manually-operated valve mechanism for controlling communication from said reservoir to the train-pipe, whereby certain small sudden increases may be made in the train-pipe pressure.

5. In an automatic vacuum-brake apparatus, a reservoir, a train-pipe, and a manually-operated valve having ports for controlling communication from the atmosphere to said reservoir and from the reservoir to the train-pipe for increasing the pressure therein.

6. In an automatic vacuum-brake apparatus, a reservoir normally containing air at atmospheric pressure, and a manually-operated valve mechanism for controlling communication from said reservoir to the train-pipe, another reservoir normally containing air at atmospheric pressure, and a valve device operated by an increase in train-pipe pressure for opening communication from the second reservoir to the train-pipe for accelerating the application of the brakes.

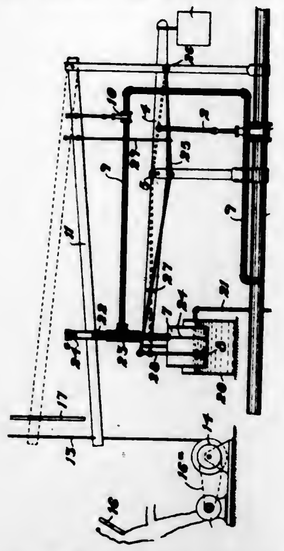
7. In an automatic vacuum-brake apparatus, a train-pipe, a reservoir normally containing air at atmospheric pressure, an operating-chamber, and means operated by the opposing pressures of the train-pipe and the operating-chamber for controlling communication from the reservoir to the train-pipe.

8. In an automatic vacuum-brake apparatus, a train-pipe, a reservoir normally containing air at atmospheric pressure, an operating-chamber communicating with the brake-cylinder, and a valve device operated by the opposing pressures of the train-pipe and the operating-chamber for controlling communication from the reservoir to the train-pipe.

9. In an automatic vacuum-brake apparatus, a train-pipe, a reservoir normally containing air at atmospheric pressure, an operating-chamber, and a valve device operated by the opposing pressures of the train-pipe and the operating-chamber for controlling communication from the reservoir to the train-pipe and from the atmosphere to the operating-chamber.

10. In an automatic vacuum-brake apparatus, a train-pipe, a reservoir normally containing air at atmospheric pressure, an operating-chamber, a movable abutment subject to the opposing pressures of the train-pipe and the operating-chamber, a valve actuated by said abutment and adapted under a small sudden rise in train-pipe pressure to open communication from the reservoir to the train-pipe, and under a large sudden rise in train-pipe pressure to open a large port direct from the atmosphere to the train-pipe.

812,482. SYSTEM OF WATER CONTROL. ADONIRAM J. COLLAR, Yreka, Cal. Filed Nov. 4, 1903. Serial No. 179,786.



Claim.—1. The combination with a water-gate, of means for controlling said gate from a remote point, said means including an operating-lever and connections between the lever and gate, a motor, means connected with the lever and controlled by the motor to oscillate the lever, a motor-controlling circuit and a keeper in the path of the lever to limit temporarily its movement in one direction.

2. The combination with a water-gate of means for controlling said gate from a remote point, said means including an operating-lever and connections between the lever and gate, a motor, means connected with the lever and controlled by the motor to oscillate the lever, a motor-controlling circuit, and a keeper for said lever, said keeper comprising an inclined guide in the path of the lever and means to hold the lever temporarily against return in one direction.

3. The combination with a water-gate of means for operating said gate, said means including a lever counterweighted at each end, one of said counterweights being variable, a liquid bath in which the variable counterweight is submergible, and electrically-controlled means to actuate said lever.

4. The combination with a water-gate, of an operating-lever, electrically-operated mechanism for controlling the movements of said lever, and means operatable by the movements of said lever whereby the opening and closing of the gate is effected, said means including a variable copnterweight, and a liquid bath in which said variable counterweight is submergible.

5. The combination with a valve-stem and a water-gate of a lever connected therewith, a valved receptacle carried by said lever, a liquid bath into which the said receptacle is adapted to be submerged, means for discharging water into said receptacle and electrically-operated means for effecting said discharge and for operating the valve in said receptacle.

6. The combination with the valve-stem of a water-gate, of a lever connected therewith, a valved receptacle carried by said lever, a liquid bath into which the said receptacle is adapted to be submerged.

supply-pipe for said receptacle, and means operatable by said re-

ing an oil-chamber provided with circumferential and side bearing

a supply-pipe for said receptacle, and means operatable by said receptacle for controlling the discharge from said pipe.

7. The combination with a valve-stem of a water-gate of a lever connected therewith, a valved receptacle carried by said lever, means for supplying water to said receptacle, a liquid bath in the path of said receptacle to limit the rate of oscillation of the lever, an electrically-operated means for admitting water to the said receptacle and for discharging it therefrom.

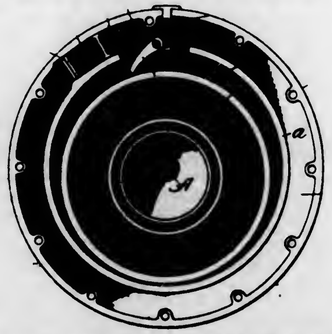
8. The combination with the valve-stem of a water-gate of a lever connected therewith, a valved receptacle carried by said lever, a liquid bath into which the said receptacle is adapted to be submerged, means for admitting water to said receptacle to effect the oscillation of said lever, and means for opening and closing the valve in said receptacle coördinately with the oscillations of said lever.

9. The combination with a water-main, of a gate therein, a stem for said gate, a lever connected with the stem, means on the lever to normally close the gate, a valved receptacle carried by the lever, a pipe connected with the main and adapted to discharge into the receptacle, a valve in the pipe, a second lever connected with said valve, electrical means for operating said second lever, and connections between said second lever and the valve in said receptacle to operate the valve in the latter coördinately with the operation of the valve in the pipe which is connected with the main.

10. The combination with a main, of a gate therein, a stem for the gate, a lever connected with the stem, means acting on the lever normally to close the gate, a valved receptacle carried by the lever, valved connections between the main and said receptacle, and means for opening and closing the respective valves in said connections and receptacle coördinately to effect the proper charging and discharging of the receptacle to oscillate the lever.

11. The combination of a valve-casing, a straightway sectional expansible valve seating therein, the sections of said valve in closing a tapered chamber, a stem having a correspondingly-tapered head inclosed in said chamber and having a limited free up-and-down movement therein, and rollers carried by said head and engaging the walls of the valve-sections.

812,483. POWER-TRANSMISSION DEVICE. FRANK DE COLIGNY, Chicago, Ill. Filed Aug. 7, 1905. Serial No. 273,047.



Claim.—1. In a power-transmission device, the combination with the driving and driven parts, of a cylinder on one of said parts having an inner bearing-surface surrounding an oil-chamber provided with inlet and outlet ports, and an oil-circulating conduit communicating with the ports, a wheel eccentrically mounted on the other of said parts to have independent rotation thereon in rolling contact with the said surface in the said chamber, a resilient deflector in said chamber between the said ports and bearing against the said wheel, a valve in said conduit, and operating means for said valve.

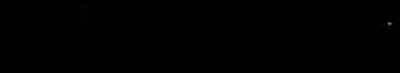
2. In a power-transmission device, the combination with the driving and driven parts, of a cylinder on one of said parts having an inner bearing-surface surrounding an oil-chamber provided with inlet and outlet ports, and an oil-circulating conduit communicating with the ports, an inner wheel eccentrically fastened to the other of said parts, an outer wheel rotating on the said inner wheel in said chamber in rolling contact with the said bearing-surface, a resilient deflector in said chamber between the said ports and bearing against the said outer wheel, a valve in said conduit, and operating means for the valve.

3. In a power-transmission device, the combination with the driving and driven parts, of a cylinder on one of said parts containing an oil-chamber provided with circumferential and side bearing-walls and provided in its circumference with inlet and outlet ports, and an oil-circulating conduit communicating with the ports, an inner wheel eccentrically fastened to the other of said parts, an outer wheel rotating on the said inner wheel in said chamber in rolling contact with the circumferential wall and in sliding contact with the said side walls, a resilient deflector in said chamber between the said ports and bearing against the said outer wheel, a valve in said conduit, and operating means for the valve.

4. In a power-transmission device, the combination with the driving and driven parts, of a cylinder on one of said parts having an outer oil-storage chamber and an inner oil-chamber provided with circumferential and side bearing-walls and provided at its circumference with inlet and outlet ports, an oil-circulating conduit extending from said outlet-port to the said outer chamber, the inlet-port being an opening between the chambers, an inner wheel eccentrically fastened to the other of said parts, an outer wheel rotating on the said inner wheel in said inner chamber in rolling contact with the circumferential wall and in sliding contact with the said side walls, a resilient deflector in said inner chamber between the said ports and bearing against the said outer wheel, a valve in said conduit, and operating means for the said valve.

5. In a power-transmission device, the combination with alined driving and driven shafts, of a cylinder on one of said shafts having an inner bearing-surface surrounding an oil-chamber provided with inlet and outlet ports, and an oil-circulating conduit communicating with the ports, the other shaft extending through a stuffing-box in one side of said chamber and into a bearing in the other side thereof and carrying an inner eccentric wheel in said chamber, an outer wheel rotating on the said inner wheel in rolling contact with said bearing-surface, and in sliding contact with the side walls of said chamber, a resilient deflector in said chamber between the said ports and bearing against said outer wheel, a valve in said conduit, and operating means for the valve.

812,484. RUBBER SHOE SOLE AND HEEL. FRANK C. CONNOR, Waco, Tex. Filed Sept. 12, 1904. Serial No. 224,075.



Claim.—1. As a new article, a sole composed of rubber having a tread portion at the front end and a heel-receiving portion at the rear end, an elastic heel secured upon the rear end of the heel-receiving portion, said elastic heel having an internal cavity D^3 having its upper face concaved transversely and longitudinally, the longitudinal cavity extending from the internal cavity D^3 to the front face of the heel to provide an open or valve space x between the heel and the heel-receiving portion of the sole-piece, said heel and sole being arranged that when the weight of the wearer rests upon the heel, the space x will close, and open again when the weight of the wearer is removed from the heel, substantially as shown and described.

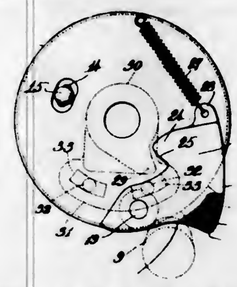
2. The hereinbefore-described improvement in rubber soles and heels comprising in combination with a rubber sole having a heel-receiving portion, a rubber heel including an internal cavity D^3, and having its upper face concaved transversely and longitudinally, the longitudinal cavity extending from the internal cavity D^3 to the front face of the heel to provide an open space x between the heel and the heel-receiving portion of the sole, the heel and sole being arranged that when the weight of the wearer rests upon the heel, the space x will close, and will open again when the weight of the wearer is removed from the heel, substantially as shown and for the purposes described.

3. As a new article of manufacture, a rubber heel having an internal cavity D^3, and having its upper face concaved transversely and longitudinally, the longitudinal cavity extending from the internal cavity D^3 to the front face of the heel to provide an open space x between the heel and the part to which it is adapted to be secured, all being arranged substantially as shown and for the purposes described.

812,485. PICKING MECHANISM FOR LOOMS. HARRY A. DAVIS, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed July 31, 1905. Serial No. 271,575.

Claim.—1. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a picking-cam to coöperate with the roll and rock said shaft, a revolving carrier on which said cam is pivotally mounted, and a trip to engage and rock the cam relatively to the carrier, to effect coöperation of the cam and roll and move the latter with a gradual and extended acceleration.

2. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a picking-cam to coöperate with the roll and rock said shaft, a revolving carrier on which said cam is pivotally mounted, and a trip to engage the cam and gradually throw it outward at a predetermined point in the revolution of the carrier, to cause the cam to act upon the roll by the combined substantially radial and angular movements of the cam.



3. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a picking-cam to coöperate therewith, and means to subject the cam to combined angular and substantially radial movement at the time of engagement with the roll, to gradually accelerate the movement of the roll through the major portion of its active stroke.

4. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a revolving carrier, a picking-cam movable with and also relatively to said carrier and adapted to coöperate with the roll, and means to effect relative movement of the cam as the latter is brought into engagement with the roll.

5. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a revolving carrier, a picking-cam movable with and also relatively to said carrier and adapted to coöperate with the roll, a toe on the cam, a fixed trip to engage said toe and effect gradually-accelerated movement of the cam relative to the carrier when the cam engages the roll, and a spring to restore the cam to normal position thereafter.

6. In a picking mechanism for looms, a picking-shaft having an arm provided with a roll, a revolving carrier, a picking-cam movable with and also relatively to said carrier and adapted to coöperate with the roll, and angularly-adjustable means to effect movement of the cam relatively to the carrier when the cam engages the roll, to gradually accelerate the movement of the roll and increase the extent of such accelerated movement.

7. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a revolving, disk-like cam-carrier, a picking-cam pivotally mounted thereon and having a roll-engaging portion projecting beyond its periphery, and a fixed tripping device to engage the picking-cam and throw outward its roll-engaging portion, to effect a gradual and extended increase in the speed with which the picking-cam moves the roll.

8. In picking mechanism for looms, a picking-shaft having an arm provided with a roll, a revolving, disk-like cam-carrier, a picking-cam pivotally mounted thereon and having a roll-engaging portion, a stop on the cam, a spring to act upon the cam and normally retain the stop in engagement with the periphery of the carrier, and a fixedly-mounted trip to periodically engage the cam between its center of revolution and the roll-engaging portion and move the latter outward to gradually increase the speed of movement of the roll when engaged by the cam.

9. In picking mechanism for looms, in combination, a picking-cam, separate means to effect bodily revolution of said cam, and intermittent outward movement thereof relative to its axis of revolution, and a picking-roll with which the cam coöperates when subjected to such combined movement.

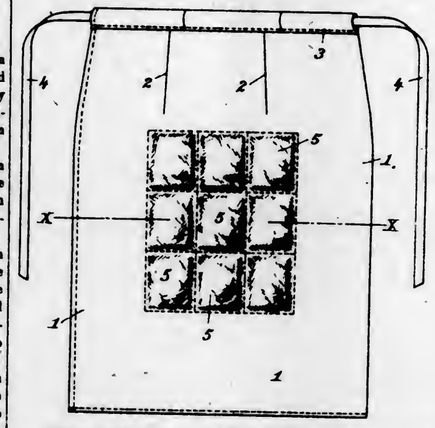
10. In picking mechanism for looms, in combination, a revolving shaft, a carrier fixedly mounted thereon, a picking-cam pivotally mounted on the carrier and having a roll-engaging portion behind its pivot, a cam-retracting spring, a fixedly-mounted trip to periodically engage the cam back of its pivot and throw its roll-engaging portion outward, and a picking-shaft provided with a roll to be intermittingly acted upon by the picking-cam.

11. In picking mechanism for looms, in combination, a picking-shaft having an arm provided with a roll, a picking-cam having a roll-engaging portion, means to bodily revolve the cam about a fixed axis, a device to swing outward said cam from its axis of revolution as it coöperates with the roll, and means to angularly adjust the said device with relation to the axis about which the cam revolves bodily.

12. In picking mechanism for looms, in combination, a revolving carrier, a picking-cam thereon having a roll-engaging portion adapted to gradually engage the roll, a picking-shaft having an arm provided with said roll, and means to move the cam relatively to its carrier to thereby cause the roll-engaging portion to gradually increase the movement of the roll due to coöperation with the cam.

13. In picking mechanism for looms, means to effect the throw of the shuttle, including a picker-stick and an operatively-connected roll, and means to coöperate with the roll and gradually accelerate the movement thereof through the major portion of its active stroke, to thereby correspondingly act upon the shuttle through the picker-stick.

812,486. SKIRT-PROTECTING GARMENT. EDWARD S. DIX, New York, N. Y., assignor to The Borated Specialty Company, Brooklyn, N. Y., a Corporation of New York. Filed Oct. 7, 1905. Serial No. 281,716.



Claim.—1. As a new article of manufacture a skirt-protecting garment comprising a marginal unpadded portion, a centrally-located padded portion and means for attaching the garment about the waist of the wearer.

2. As a new article of manufacture a skirt-protecting garment comprising a marginal unpadded portion, a padded and quilted central portion of about one-fourth the area of the entire garment; a waistband with hem and draw-string, the upper portion of the garment being gored to fit about the waist.

812,487. TEMPER-SCREW. CHESTER W. FARTON, Wellsville, N. Y., assignor to The Oil Well Supply Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed May 15, 1905. Serial No. 260,501.

Claim.—1. In a temper-screw, the combination of a feed-screw, a divided nut, means for maintaining an operative engagement of the nut and feed-screw, and a yielding detent for preventing the accidental disengagement of the nut and feed-screw.

2. In a temper-screw, the combination with a feed-screw, divided nut, and clamp-screw, of a yielding detent for controlling the clamp-screw.

3. In a temper-screw, the combination of a feed-screw, a divided nut therefor, means for maintaining the operative relation of the feed-screw and nut, and a yielding detent for preventing the accidental disengagement of the nut and feed-screw, said detent being adjustable with relation to the feed-screw.

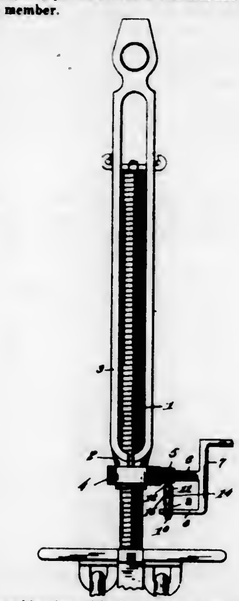
4. The combination with the temper-screw, a split nut for engaging same, a strap surrounding said split nut, and a transverse screw for causing engagement of the split nut with the temper-screw, of means for preventing the accidental loosening of said transverse screw, said means consisting of a ratchet device fixed upon said strap and a pawl carried by said transverse screw to engage said ratchet device, substantially as described.

5. The combination with the temper-screw, a split nut for engaging the same, a strap surrounding said split nut, and a trans-

verse screw operating through said strap for causing engagement of

slots, a middle piece having tongues disposed alternately on each

verse screw operating through said strap for causing engagement of the split nut with the temper-screw, of means for preventing the accidental disengagement of said transverse screw, said means consisting of a ratchet member on one side of said strap and through which said transverse screw passes, an arm fixed to said transverse screw, and a spring-pawl secured to said arm and adapted to engage said ratchet member.



6. The combination with the temper-screw, a split nut for engaging the same, a strap surrounding said split nut, and a transverse screw operating through the strap for causing engagement of the split nut with the temper-screw, of means for preventing accidental loosening of said transverse screw, said means consisting of a ratchet-cylinder on one side of said strap and through which said transverse screw passes, an arm fixed to said transverse screw and having an angular extension projecting inward parallel to said screw, and a member adjustable upon said extension and carrying a spring-pawl to engage said ratchet-cylinder.

7. The combination with the temper-screw, a split nut for engaging same, a strap surrounding said split nut, and a transverse screw operating through the strap for causing engagement of the split nut with the temper-screw, of means for preventing accidental loosening of said transverse screw, said means consisting of a ratchet member fixed to said strap, an arm carried by said transverse screw, a spring-pawl on said arm positioned to engage said ratchet, and means for locking said pawl in inoperative position at will, substantially as described.

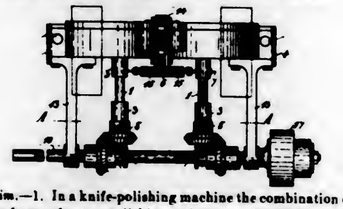
812,488. **SHEAVE.** WILLIAM C. PECHER, New York, N. Y., assignor to Standard Pulley Manufacturing Company, a Corporation of New York. Filed Oct. 3, 1904. Serial No. 226,947.

Claim.—1. As a new article of manufacture, a sheave formed of two side plates having flanges to form a rim, and a middle piece provided with tongues, the said side plates being provided with slots through which said tongues protrude and said tongues being bent to lock the parts together, substantially for the purposes set forth.

2. As a new article of manufacture, a sheave formed of two side plates having flanges to form a rim and a middle piece provided with a series of tongues disposed alternately on each side thereof, each of said side plates having a series of slots through which said tongues protrude and said tongues being bent against said side plates to tie the parts together, substantially for the purposes set forth.

3. As a new article of manufacture a sheave formed of two side plates having flanges to form a rim and provided with a series of slots, a middle piece having tongues disposed alternately on each side thereof to coöperate with said slots to tie the parts together, said middle piece having a central circular aperture for a hub and a cylindrical hub formed of one piece of metal having a lug thereon and integral therewith to engage a notch in said middle piece, substantially for the purposes set forth.

812,489. **KNIFE-POLISHING MACHINE.** FRANZ FRIEG, Ludwigsburg, Germany. Filed Jan. 4, 1905. Serial No. 239,668.



Claim.—1. In a knife-polishing machine the combination of two swinging frames for two polishing-rollers, an adjustable spring acting to automatically draw together one roller toward the other and movably-arranged motion-transferring gear-wheels, substantially as and for the purpose specified.

2. In a knife-polishing machine the combination of two swinging frames for two polishing-rollers, an adjustable spring acting to automatically draw together one roller toward the other, a driving-shaft, longitudinal grooves on said driving-shaft, shiftable motion-transferring gear-wheels the longitudinal movements of which are guided in said grooves, collars fastly connected to said gear-wheels and provided with grooves running around said collars, in which grooves the free ends of the roller-shafts carrying the coöperating gear-wheels are guided, substantially as and for the purpose set forth.

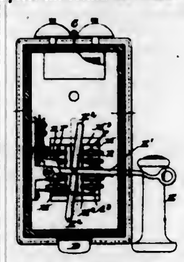
812,490. **WINDOW-SCREEN.** SAMUEL H. GARRETT, West Philadelphia, Pa. Filed Apr. 24, 1905. Serial No. 257,117.

Claim.—1. A window-screen, consisting of a series of plain bars and a series of clamp-bars, the clamps of the series of said clamp-bars adapted to be rigidly connected with their respective bars and to form projecting eyes, at both ends of the same, said eyes adapted to receive and to surround the other series of plain bars and to loosely connect the same with said clamp-bars to permit of the sliding of said clamp-bars on said plain bars to required position, means adapted to lock the clamps to said plain bars to form in conjunction with said clamp-bars a substantially rectangular and rigid frame, a flexible fabric, grooves arranged in said plain and clamp bars adapted to receive said flexible fabric and to hold the same taut thereon, and means engaging said grooves and the fabric and adapted to removably connect the same with said bars.

2. A window-screen, consisting of a series of plain bars and a series of clamp-bars, the clamps of said series of clamp-bars adapted to be rigidly connected with their respective bars and to form projecting eyes at both ends of the clamp-bars, said eyes adapted to receive and to surround the other series of plain bars to form in conjunction therewith a rectangular frame, a flexible fabric, a groove extending from end to end in each of said clamp-bars, and a groove having a rectangular extension at one end arranged in each of said plain bars and opposite the groove of the adjacent clamp-bar and an ungrooved portion at the other end, said flexible fabric adapted to be inserted in the grooves of said bars and to rest upon the ungrooved portion of said plain bars to permit of a ready engagement and removal of the fabric from said grooves, and means engaging said grooves and the fabric and adapted to removably connect the same with said bars.

812,491. **TELEPHONE-SWITCH-PLUG MECHANISM.** ADOLPH C. GELSER, Passaic, N. J., assignor to The New York Automatic Telephone Company, Paterson, N. J., a Corporation of New Jersey. Filed Nov. 25, 1904. Serial No. 234,130.

Claim.—1. In a switch-plug mechanism, a plug having a conical end, and a contact-spring having a portion disposed in the path of and constructed to engage said plug frictionally and hold said plug when the latter is moved in one direction and to act upon said conical end to complete the return movement of said plug.



2. In a switch-plug mechanism, a plug having a conical end, a contact-spring having a portion disposed in the path of and contructed to engage said plug frictionally and hold said plug when the latter is moved in one direction and to act upon said conical end to complete the return movement of said plug, and means for initiating such return movement.

3. In a switch-plug mechanism, a plug having a conical end, a contact-spring having a portion disposed in the path of and constructed to engage said plug frictionally and hold said plug when the latter is moved in one direction and to act upon said conical end to complete the return movement of said plug, and means operated by a receiver-hook or analogous switch for initiating such return movement.

4. In a switch-plug mechanism, a plug having a cylindrical head and conical end, means for initiating the return movement of the plug, and a contact-spring having a portion disposed in the path of and constructed to engage frictionally with said head and hold said plug when the latter is moved in one direction and to act upon said conical end to complete the return movement of said plug, and means for making and breaking an electric circuit through the movements of said spring.

5. In a switch-plug mechanism, a plug having a cylindrical head and conical end, a contact-spring having a portion disposed in the path of and constructed to engage frictionally with said head and hold said plug when the latter is moved in one direction and to act upon said conical end to complete the return movement of said plug, means for initiating such return movement, and means for making and breaking an electric circuit through the movements of said spring.

6. In a switch-plug mechanism, a plug having a cylindrical head and conical end, a contact-spring having a portion disposed in the path of and constructed to engage frictionally with said head and hold said plug when the latter is moved in one direction and to act upon said conical end to complete the return movement of said plug, means operated by a receiver-hook or analogous switch for initiating such return movement, and means for making and breaking an electric circuit through the movements of said spring.

7. In a switch-plug mechanism, a plug having a cylindrical head and conical end, a contact-clip, a contact-spring having a portion disposed in the path of and constructed to engage said head frictionally and hold said plug when the latter is moved in one direction and also contact with said clip, and to act upon said conical end to complete the return movement of said plug and break such contact, and means for initiating such movement.

8. In a switch-plug mechanism, a series of plugs having each a cylindrical head and conical end, a contact-clip for each plug, a contact-spring for each plug having a portion disposed in the path of and constructed to engage said head frictionally and hold said plug when the latter is moved in one direction and also contact with its clip, and to act upon said conical end to complete the return movement of said plug and break such contact, a reset bar adapted to act on said heads to initiate such return movement, and means for actuating said reset bar.

9. In a switch-plug mechanism, a series of plugs arranged in a row, each having a cylindrical head and conical end, a corresponding series of contact-springs each bent upon itself to form an angular shoulder and a contact-point, a series of contact-clips one adjacent to each of said contact-points, the said shoulder adapted to engage the head of its plug frictionally and hold said plug when the latter is moved in one direction and with its contact-point in wiping contact with its contact-clip, and to break such contact and act upon said conical end to complete the return movement of said plug, a reset bar extending along said row of plugs and adapted to act on said heads to initiate such return movement, and means carried by the receiver-hook or analogous switch adapted to actuate said reset bar.

10. In combination with a telephone-box having a receiver-hook, a series of plugs loosely mounted in the casing of said box and extending into the interior thereof, each of said plugs having a cylindrical head and a conical end, a contact-clip for each plug, a contact-spring for each of said plugs adapted to engage said head frictionally and hold its plug when the latter is thrust toward the interior of said box and make contact with its clip, and to break such contact and act upon the conical end of its plug to complete the return movement of said plug, a reset bar arranged adjacent to said series of plugs and adapted by its movement to initiate such return movement, and a spring-arm carried by said receiver-hook and adapted to move said reset bar when said receiver-hook is depressed.

11. In combination with a telephone-box having a receiver-hook, two series of plugs loosely mounted in the casing of said box in parallel rows and extending into the interior of said box, each of said plugs having a cylindrical head and conical end, two series of contact-clips one clip for each plug, two series of contact-springs, one spring for each plug, each of said contact-springs adapted to engage the head of its plug frictionally and hold said plug when the latter is thrust toward the interior of said box and make contact with its clip, and to break such contact and act upon the conical end of its plug to complete the return movement of said plug, two reset bars, one for each series of plugs, each adapted by its movement to initiate such return movement of any plug of its series, and spring-arms carried by said receiver, adapted when said receiver-hook is raised to lie between said reset bars and to move the latter when said receiver-hook is depressed.

12. In a switch-plug mechanism, a plug arranged to be moved axially, a contact-clip, a contact-spring in the path of said plug and adapted to be moved aside by said plug into wiping contact with said clip, and means in the path of said plug and pivoted for moving said plug laterally toward said clip, whereby the extent of said wiping movement is increased.

13. In a switch-plug mechanism, a plug arranged to be moved axially, a contact-clip, a contact-spring in the path of said plug and adapted to be moved aside by said plug into wiping contact with said clip, and means for inducing a return movement of said plug and also moving said plug laterally toward said clip, whereby the extent of such wiping movement is increased.

14. In a switch-plug mechanism, a series of plugs, a contact-spring for each plug, and a contact-clip for each spring, the latter adapted to be moved into contact with its clip by an endwise movement of its plug, a reset bar common to all the plugs in said series, a receiver-hook or analogous switch, and a spring-arm carried by said hook, the construction and arrangement being such that when said hook is depressed and a plug pushed in said reset bar will be held in an inoperative position, when said hook is elevated, said bar will be released, and when said hook is again depressed, said reset bar will be moved in the direction to induce a return movement of said plug.

15. In a switch-plug mechanism, two series of plugs arranged in two parallel rows, a contact-spring for each plug and a contact-clip for each spring, the latter adapted to be moved into contact with its clip by an endwise movement of its plug, two reset bars each common to all the plugs of one series, a receiver-hook or analogous switch, and oppositely-extending spring-arms thereon, each of said arms adapted to actuate one of said reset bars.

16. In a switch-plug mechanism, a receiver-hook having a spring-arm, a plug adapted to be moved axially, a contact-clip, and a contact-spring, the said contact-spring serving to hold said plug frictionally at one end of its movement and to make contact with said clip, and to complete the return movement of said plug and to break such contact, and a reset bar actuated by said spring-arm, arranged to strike said plug and initiate such return movement by the depression of said receiver-hook.

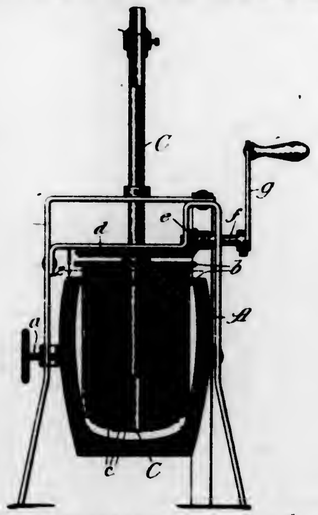
812,492. **SUPPORTING-LUG FOR BOILERS.** CHARLES S. HOOPER, Erie, Pa. Filed Dec. 31, 1904. Serial No. 239,151.

Claim.—1. A boiler-lug constructed from a sheet of plate metal, bent into U-shaped form so as to provide a horizontal member, and vertical webs at the sides thereof, and a flange at one end of said U-shaped structure adapted to be riveted to a boiler, substantially as described.

2. A boiler-lug constructed from a sheet of plate metal, so bent as to provide a horizontal member having triangular webs at the sides thereof, an outwardly-projecting flange on said horizontal member and said vertical triangular webs at the larger end of the lug adapted to rest against and be riveted to the boiler, substantially as described.

3. A boiler-lug having a horizontal member, brace-webs at the sides thereof, and a radial flange around one end of said horizontal member and brace-webs, said flange being formed to fit the contour of the surface to which the lug is to be secured, all formed from one piece of sheet metal, substantially as set forth.

812,493. METHOD OF GRANULATING ALUMINIUM. WILLIAM HOSKINS, Lagrange, Ill. Filed Aug. 26, 1904. Serial No. 223,210.



Claim.—1. The method of reducing aluminium, and other metals the oxide of which have a high melting-point, to a more or less finely-divided condition, which consists in forcing an oxidizing-gas into the molten mass to impregnate the same, at the same time agitating the mass, and continuing the agitation while the mass is cooling, thereby causing the mass in solidifying to separate into superficially-oxidized particles.

2. The method of reducing aluminium, and other metals, the oxids of which have a high melting-point, to a more or less finely-divided condition, which consists in forcing an oxidizing-gas into the molten mass, at the same time mechanically stirring the mass, and continuing the stirring while the mass is cooling, thereby causing the mass in solidifying to separate into superficially-oxidized particles.

812,494. SOLDERING COMPOUND. ALFRED R. HUSSEY, Chicago, Ill. Filed Oct. 12, 1903. Renewed June 5, 1905. Serial No. 263,870.

Claim.—1. An article of manufacture for soldering consisting of soft metals rendered finely granular and mixed with a flux-impregnated fatty substance, and made into sticks or bars.

2. An article of manufacture for soldering consisting of soft metals rendered finely granular, the same being mixed with a flux-impregnated fatty substance and made into sticks or bars, such sticks or bars being provided with a metal skin fusible at moderate temperature.

3. An article of manufacture for soldering consisting of soft metals rendered finely granular, the same being mixed with a flux-impregnated fatty substance and made into sticks or bars, such sticks or bars being inclosed in a retaining-skin of soft-metal foil.

4. An article of manufacture for soldering consisting of soft metals finely comminuted and mixed with a flux-impregnated fatty substance made into sticks or bars and provided with a tin-foil skin.

5. A soldering compound consisting of finely-granular lead and tin in the proportion of one part tin to from one to three parts lead, thoroughly mixed with a wax impregnated with chlorid of zinc.

6. A soldering compound consisting of soft soldering metals finely comminuted and thoroughly mixed with a flux-impregnated fatty substance hardened with rosin.

7. A soldering compound consisting of soft soldering metals finely comminuted and thoroughly mixed with flux-impregnated beeswax.

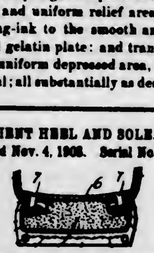
8. An article of manufacture for soldering consisting of soft metals intermixed with the proper flux and made into sticks or bars, in combination with a retaining-skin adapted to be fused with the substance of such sticks.

9. An article of manufacture for soldering consisting of soft metals rendered finely granular, the same being mixed with a flux-impregnated fatty substance and made into sticks or bars, in combination with a retaining-skin adapted to be fused with the substance of the sticks.

812,495. PHOTOMECHANICAL PRINTING. JOHN W. IPPERS, New York, N. Y., assignor to Albert Henry Walker, trustee, New York, N. Y. Filed June 26, 1905. Serial No. 266,382.

Claim.—The following process in photomechanical printing: making a gelatin emulsion, sensitized with bichromate of ammonia: applying that gelatin emulsion to a flat base, and drying and baking it thereon: exposing the resulting baked gelatin plate to light, through a sheet having a uniformly-translucent area, and a uniformly-opaque area: developing that exposed gelatin plate, by bathing it in water, and thereby swelling into smooth and uniform relief, that area thereof which was under the opaque area of that sheet during the exposure, while leaving in smooth and uniform depression, that area thereof which was under the translucent area of that sheet during the exposure: drying that developed gelatin plate in air: applying glycerin solution to the smooth and uniform relief area of that dried gelatin plate: applying printing-ink to the smooth and uniform depressed area of that glycerined gelatin plate: and transferring printing-ink from that smooth and uniform depressed area, to a smooth and solid surface of stone or metal; all substantially as described.

812,496. RESILIENT HEEL AND SOLE. HERBERT E. IRWIN, Galesburg, Ill. Filed Nov. 4, 1903. Serial No. 179,783.



Claim.—1. A resilient heel or sole for a boot or shoe having embedded in its body woven-wire fabric and a framework consisting of larger wires or the like, said wire fabric being arranged to lie upon the said framework and means for integrally securing the wire fabric thereto, substantially as described.

2. A resilient heel or sole for a boot or shoe having embedded in its body woven-wire fabric and a framework consisting of larger wires or the like, said wire fabric being arranged to lie upon and to be integrally secured to the said framework so that the larger wires are anchored or firmly held in the heel or sole, substantially as described.

3. A resilient heel or sole for a boot or shoe consisting of two parts, the inner part being composed of a soft or sponge-like material, the outer part of a firmer rubber compound or other material, said outer part having embedded in its body woven-wire fabric and a framework of larger wires or the like, the woven-wire fabric being integrally united to the said framework, substantially as described.

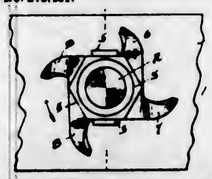
4. The combination with a boot or shoe having an insole therein, of a resilient heel composed of two parts, an outer open-top rubber shell having a stiff base 13 and flexible sides 11 extending at the entire periphery of the shell into thickened flange edge 12 adapted to abut against the base of the said shoe or boot, said shell being strengthened by textile fabric embedded therein, and an inner resilient core

arranged to fit within the heel-shell and to come into contact with the said insole, said heel being secured to the boot or shoe by means penetrating the said insole and passing entirely through the thickened flange 12 and textile fabric 10, whereby the heel is secured at the entire periphery of its shell-top, substantially as described.

5. The combination with a boot or shoe, of a heel composed of a resilient core and an outer open-top shell, said shell having a stiff bottom 13 and thin flexible sides 11 extending into an enlarged flange 12 arranged to abut against the boot or shoe sole, a metallic member placed against the side of said shell-flange, and screws or the like passing through the sole and engaging said metallic member whereby the shell is held securely to the boot or shoe, substantially as described.

6. The combination with a boot or shoe, of a heel composed of a resilient core and an outer rubber shell, said shell having a stiff bottom, flexible sides and an open top and being interiorly lined with a textile fabric, the edges of the shell adjacent to the said opening being thickened, a metallic member arranged to abut against the said thickened edges and screws or the like passing through the insole and engaging the metallic member thereby clamping the heel to the boot or shoe, substantially as described.

812,497. NUT-LOCK. RUDOLPH G. JARNER, Cincinnati, Ohio, assignor of one-half to John Benshe, Cincinnati, Ohio. Filed July 19, 1905. Serial No. 270,401.



Claim.—1. In a nut-lock, a nut, a resilient washer having two of its opposite sides formed with outwardly-turned straight flanges on the edges of the washer adapted to engage the sides of the nut, there being spurs projecting from the outer edges of the washer between the flanges which are spirally inclined in the direction of rotation of tightening the nut, and the points of which are bent inward, substantially as described.

2. In a nut-lock, a nut, a resilient washer having flanges bent outwardly from opposite sides thereof, which engage against opposite sides of the nut and hold the nut between them, spurs radially extended from the edges of the washer, said spurs being projected serially longer so that their points lie in different concentric circles around the outside of the nut, the points of said spurs being spirally inclined in the direction of rotation of tightening the nut, and inwardly bent, substantially as described.

812,498. BUILDING-BLOCK. JOHN A. JOHNSON, Winamac, Ind. Filed Mar. 16, 1905. Serial No. 250,457.

Claim.—1. A building-block having vertical air-passages triangular in cross-section with a side of each passage parallel with the front face of the block, said passages being separated by walls which increase in thickness toward the back of the block.

2. A building-block of concrete or other molded material having vertical air-passages separated by walls which increase in thickness toward the back of the block, said air-passages being closer to the front than to the rear wall of the block.

812,499. DECOY. FRANK J. JOHNSTON, Sacramento, Cal. Filed Sept. 8, 1905. Serial No. 277,483.

Claim.—1. In a decoy, a profile-frame, back-frames hinged to said profile-frame and foldable upward into planes parallel with the profile-frame, and suitable flexible coverings for said frames.

2. In a decoy the combination of a profile-frame, back-frames hinged to said profile-frame and foldable upward into planes substantially parallel with the plane of the profile-frame, similarly-foldable tail-frames hinged to the back profile-frame and attached to the back-frames, and suitable coverings for said frames.

3. In a decoy the combination of a profile-frame, back-frames hinged to said profile-frame and foldable upward into planes substantially parallel with the plane of the profile-frame, similarly-foldable tail-frames hinged to the back profile-frame and attached to the back-frames, suitable coverings for said frames, the covering for the tail-frames extending beyond said frames to provide a flexible fringe in simulation of tail-feathers.

4. In a decoy the combination of a profile-frame, back-frames hinged to the front and rear of said profile-frame and foldable into planes substantially parallel with the plane of the profile-frame, a flat covering for the profile-frame, and flexible coverings attached to the back-frames and to or adjacent to the back portion of the profile-frame, said back-coverings limiting the downward movement of said back-frame.

5. In a decoy the combination of a rigid one-piece profile-frame, a covering therefor, back-frames hinged to said profile-frame, flexible coverings connected with said back-frames and said profile-frame and limiting the downward movement of said back-frames, said latter being foldable upwardly into planes approximately parallel with the plane of the profile-frame.

6. In a decoy the combination of a rigid one-piece profile-frame, a covering therefor, back-frames hinged to said profile-frame, flexible coverings connected with said back-frames and said profile-frame and limiting the downward movement of said back-frames, said latter being foldable upwardly into planes approximately parallel with the plane of the profile-frame, side body-frames hinged to the profile-frame, and a flexible waterproof covering secured to the side body-frames and to the covering of the profile-frame inclosing compartments.

7. In a decoy the combination of a rigid one-piece profile-frame, a covering therefor, back-frames hinged to said profile-frame, flexible coverings connected with said back-frames and said profile-frame and limiting the downward movement of said back-frames, said latter being foldable upwardly into planes approximately parallel with the plane of the profile-frame, side body-frames hinged to the profile-frame, a flexible waterproof covering secured to the side body-frame and to the covering of the profile-frame inclosing compartments, said side body-frames being foldable downward against the profile-frame.

8. In a decoy the combination of a profile-frame, foldable back-frames and foldable side body-frames, and a suitable covering for said frames.

9. In a decoy the combination of a profile-frame, foldable back-frames and foldable side body-frames, and a suitable covering for said frames, said back-frames being foldable independently of the side body-frames.

10. In a decoy the combination of a profile-frame, foldable back-frames and foldable side body-frames, and a suitable covering for said frames, said back-frames being foldable upwardly and said side body-frames being foldable downwardly against the profile-frame to form a flat package.

11. In a decoy the combination of a profile portion, foldable back and side body portions, said side body portions inclosing chambers, and means for locking the side body portion and back portion in operative position.

12. In a decoy the combination of a profile portion, foldable back and side body portions, said side body portions inclosing chambers, and means for locking the side body portion and back portion in operative position, said locking means comprising a hook member carried by one portion and engaging a corresponding opposed portion.

13. In a decoy the combination of a rigid profile-frame, a covering therefor, back and side body-frames hinged to said profile-frame, flexible coverings for said side body and back frames, said side body-covering inclosing compartments.

14. In a decoy the combination of a rigid profile-frame, a covering therefor, back and side body-frames hinged to said profile-frame, flexible coverings for said side body and back frames, said side body-covering inclosing compartments, said side body-frames being fold-

able downwardly, and said back-frames being foldable upwardly against the profile-frame.

---

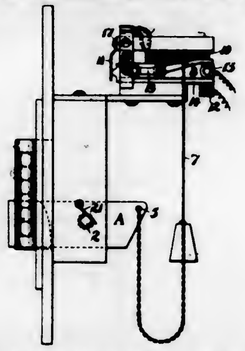
each section on the shank, and an actuating member adapted to

3. A battery element comprising perforated shells disposed one

able downwardly, and said back-frames being foldable upwardly against the profile-frame.

16. In a decoy the combination of a rigid profile-frame, a covering therefor, back and side body-frames hinged to said profile-frame, flexible coverings for said side body and back frames, said side body-covering inclosing compartments, said side body-frames being foldable downwardly, and said back-frames being foldable upwardly against the profile-frame, and means when said frames are distended to lock the back-frames to the side body-frames.

812,500. **DOOR-RELEASING MECHANISM.** EDWARD KAUFFER, Hanford, Cal. Filed Nov. 25, 1904. Serial No. 234,226.



Claim.—1. In a door-releasing device, a latch pivoted and turnable upon one member of the door structure, a vertically-slotted keeper upon the other member, with which the latch may be engaged, a weight suspended from the inner end of the latch, a destructible cord connected therewith by which said weight is normally held out of action, and means controlled from a distant point for destroying the cord and thereby releasing the suspended weight to allow it to disengage the latch.

2. In a door-releasing device, a pivoted vertically-turnable latch carried upon one member of the door structure, a keeper carried upon the other member having a vertical slot and antifrictional devices within the slot with which the latch engages, a suspended weight so connected with the opposite end of the latch that when disengaged it will act to swing the latch and release the door, a destructible cord connecting with the weight and normally holding it out of action, and means controlled from a distant point for generating a destructive heat by which said cord is destroyed and the weight released.

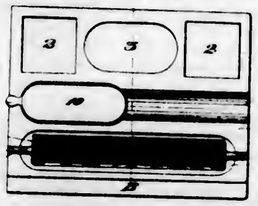
3. In a door-releasing device, a latch and a keeper located upon the door-frame and the door, a weight connecting with the inner end of the latch, a cord by which the weight is normally suspended out of action, an electrically-heated part with which the cord is maintained in contact, means for completing an electrical circuit whereby said part is heated, the cord destroyed and the weight allowed to act to disengage the latch.

4. In a door-releasing device, a turnable latch and a keeper located upon the door and the frame thereof, a weight connected with the latch, a cord by which said weight is normally held out of action, a device by which said cord may be destroyed, said device consisting of electrical conductors capable of being heated, plates between which said conductors are carried, electrical circuits established through said conductors a spring-pressed lever over which and in contact with the parts to be heated the suspending-cord is passed, whereby the lever is held in position to form part of the electrical circuit and distant contacts by which said circuit may be closed and the cord destroyed.

5. In a door-releasing device, an antifrictional keeper located in one member of the door structure, a vertically-turnable latch, a shaft upon which said latch is centrally fixed with its ends projecting in opposite directions, a weight acting upon one end of the latch to disengage the other end from the keeper, a destructible retaining device and an electrically-actuated means controlled from a distant point for generating a destructive heat by which said device may be destroyed and the weight released.

6. In a door-releasing device, a latch and keeper located respectively in the door-casing and door, a pivot-pin to which the latch is centrally fixed, said pivot-pin having projecting ends and attachment by which it is turnable, a destructible casing inclosing said ends, a weight connecting with one end of the latch, a device by which said weight is normally suspended out of action and means by which the suspending device may be destroyed.

812,501. **DESK APPURTENANCE.** ALBERT KAYSER, Oakland, Cal. Filed Sept. 8, 1905. Serial No. 277,576.



Claim.—1. A paper-weight and desk appurtenance consisting of a rectangular block having ink-wells and receptacles at the rear, said block having a compartment extending longitudinally thereof and a pencil-sharpening file turnably supported above said compartment.

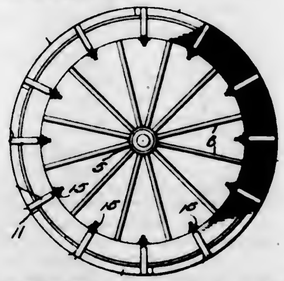
2. In a paper-weight and desk appurtenance, a block having compartments formed therein, and having a chamber extending from end to end of the front, a file having pivots or journals at its end, and journal-boxes at the end of the compartment upon which the journals rest and are turnable.

3. In a paper-weight and desk appurtenance, a block having compartments formed therein, said block having, also, a depressed chamber extending from end to end and having journal-boxes or depressions upon the top at each end, and a file of less width than the chamber having journals projecting centrally from its ends, and turnable in the journal-box whereby the file may be inclined or turned with relation to the compartment.

4. A paper-weight and desk appurtenance comprising a block having compartments at the rear and a dust-collecting chamber at the front, said block having, also, a segmental depression between the front chamber and the rear compartments and extending lengthwise of the block, a turnable file journaled above the front chamber, and a removable tray in line with the intermediate depression.

5. An article of manufacture consisting of a unitary structure having compartments at the front and rear, and having an intermediate depression, a file journaled above the front compartment, and a tray removably mounted in said depression.

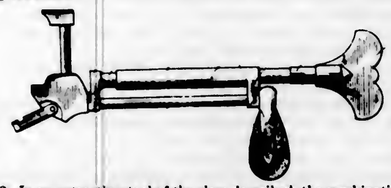
812,502. **TRACTION-WHEEL.** FRED H. KNIGHT, Troy, Pa. Filed May 1, 1905. Serial No. 258,231.



Claim.—The combination with a wheel, of a removable flange disposed against the periphery and comprising segmental sections having their mutually-adjacent ends halved and overlapped and provided with transversely-alining notches and retaining-clips having notched portions engaged in the alining notches of the segmental sections and embracing the felly of the wheel.

812,503. **PIANO-HAMMER EXTRACTOR.** CARL H. LAHR, Chicago, Ill. Filed Apr. 14, 1905. Serial No. 255,690.

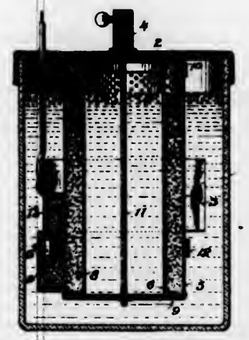
Claim.—1. In an extracting-tool of the class described, the combination of a shank composed of a tubular internally-threaded fixed section, a movable section adapted to telescope in the tubular fixed section, a bifurcated pressure member extending laterally from each section on the shank, and an actuating member adapted to screw into the fixed section to engage the movable section for operating the latter.



2. In an extracting-tool of the class described, the combination of a shank composed of a relatively fixed tubular section, a relatively movable section adapted to telescope in the tubular section, an independent actuating member operating in the tubular portion of the fixed section and coacting with the movable section to actuate the same, and a pressure member extending from each of the sections.

3. In an extracting-tool of the class described, the combination of a shank composed of a tubular fixed section internally threaded at a point about intermediate its ends, a movable section adapted to telescope in either end of the fixed section, a pressure member projected laterally from each section of the shank, and a threaded actuating member adapted to be screwed into the tubular portion of the fixed section from either end thereof for actuating the movable section.

812,504. **PRIMARY BATTERY.** CHARLES H. LOCKWOOD and GEORGE A. LUTZ, New York, N. Y. Filed July 18, 1904. Serial No. 217,083.



Claim.—1. A battery element comprising a perforated retainer containing a depolarizer and having a binder soluble in a battery liquid or solution for preventing such depolarizer from passing through the perforations in the retainer, substantially as described.

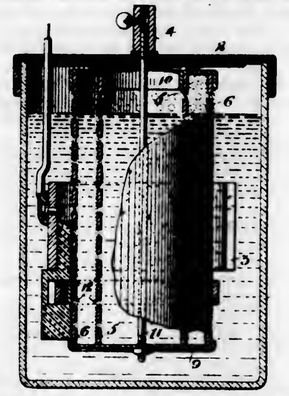
2. A battery element comprising perforated shells disposed one within another providing a space closed at opposite ends, a depolarizer within said space, and a binder soluble in a battery liquid or solution serving to prevent the depolarizer from passing through the perforations of the shells, substantially as described.

812,505. **PRIMARY BATTERY.** CHARLES H. LOCKWOOD and GEORGE A. LUTZ, New York, N. Y. Original application filed July 18, 1904, Serial No. 217,083. Divided and this application filed Mar. 29, 1905. Serial No. 253,783.

Claim.—1. A battery element comprising a perforated retainer containing a depolarizer and having a binder soluble in a battery liquid or solution applied to the wall of the retainer closing the perforations therein to prevent such depolarizer from passing through the perforations in the retainer, said binder being of a character to not materially affect the electrical efficiency of the battery, substantially as described.

2. A battery element comprising perforated shells disposed one within another, providing a space between the shells, a depolarizer within said space, and a binder soluble in a battery liquid or solution applied to said shells, closing the perforations therein to prevent the depolarizer from passing through the perforations of the shells, said binder being of a character to not materially affect the electrical efficiency of the battery, substantially as described.

3. A battery element comprising perforated shells disposed one within another, providing a space closed at opposite ends, a depolarizer within said space, and a binder soluble in a battery liquid or solution applied along the walls of said shells covering the perforations therein to prevent such depolarizer from passing through the perforations, said binder being of a character to not materially affect the electrical efficiency of the battery, substantially as described.

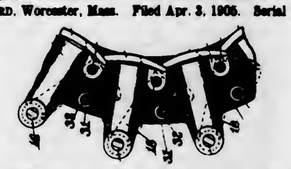


4. In a battery, the combination of a liquid-holding jar, a perforated retainer therein containing a depolarizer, a binder applied to the wall of the retainer closing the perforations therein to prevent the depolarizer from passing through the perforations in the retainer, said binder being soluble in the battery liquid or solution and of a character to not materially affect the electrical efficiency of the battery, and a negative element in the jar adjacent said retainer, substantially as described.

5. In a battery, the combination of a liquid-holding jar, a retainer therein having inner and outer perforated walls providing a space, a depolarizer in said space, a binder applied to the walls of the retainer closing the perforations therein to prevent the depolarizer from passing through the perforations in the retainer, said binder being soluble in the battery liquid or solution and of a character to not materially affect the efficiency of the battery, and a negative element in the jar adjacent said retainer, substantially as described.

6. In a battery, the combination of a liquid-holding jar, a perforated retainer therein, a depolarizer in the retainer, a zinc between the retainer and the wall of the jar, a caustic solution in the jar, and a binder applied to the wall of the retainer closing the perforations therein, said binder being soluble in said solution and of a character to not materially affect the electrical efficiency of the battery, substantially as described.

812,506. **GATE MECHANISM FOR TURBINES.** NATHANIEL LOMBARD, Worcester, Mass. Filed Apr. 3, 1905. Serial No. 253,473.



Claim.—1. The combination with a water-wheel, of a plurality of gates each of which is provided with a curved inner face constructed and arranged to form a side wall of one of the inlets to said wheel, said face being concentric to the axis of said gate and interposed between said axis and the axis of said water-wheel.

2. The combination with a water-wheel, of a plurality of pivoted gates each provided with a member at right angles to a line radial to said pivot and interposed between said pivot and the axis of said water-wheel, each member being adapted to overlap another adjacent member and having a curved inner face concentric to its pivot, said face constructed and arranged to form a side wall of one of the inlets to said gates.

3. The combination with a water-wheel, of a plurality of pivoted gates each provided with a member at right angles to a line radial to

said pivot and interposed between said pivot and the axis of said water-wheel, each member being adapted to overlap another adja-

4. In combination, a member provided with a handle, a second member slidably supported on the first member, a double crank on

13. In combination, a member provided with a handle, a rotatable shaft journaled on said member, a second member slidably con-

shaft and lay, a spring-actuated rock-lever having its arms engaged with the spring binder-arm and an operating-lever having one arm

said pivot and interposed between said pivot and the axis of said water-wheel, each member being adapted to overlap another adjacent member and having a curved inner face concentric to its pivot, said face constructed and arranged to form a side wall of one of the inlets to said gates, a rotatable member, and a link interposed between said rotatable member and each of said gates.

4. The combination with a water-wheel, of a plurality of pivoted gates provided with working faces concentric to the pivots thereof, the face of each gate being adapted in closed position to overlap the inner face of an adjacent gate, and means for moving said gates about their pivots.

5. The combination with a water-wheel, of a plurality of pivoted gates each having an inner working face concentric to its pivot adapted to serve as a side wall to direct the inflow at substantially the same point at all times.

6. The combination with a water-wheel, of a plurality of pivoted gates each having concentric to its pivot an inner working face constructed and arranged to form a side wall of the inlet to said wheel, and means for moving said gates simultaneously about said pivots.

7. The combination with a water-wheel, of two plates, studs interposed between said plates, a swinging T-shaped gate mounted upon each of said studs the cross member of which is adapted in closed position to overlap the cross member of an adjacent gate, and means for moving said gates about said studs.

8. The combination with a water-wheel, of two plates, studs interposed between said plates, a swinging T-shaped gate mounted upon each of said studs the cross member of which is adapted in closed position to overlap the cross member of an adjacent gate, means for moving said gates about said studs, a rotatable member above the top plate, and a link interposed between said rotatable member and each of said swinging gates.

9. The combination with a water-wheel, of a plurality of pivoted gates having members adapted to overlap each other when in closed position each of said members being provided with an inner working face concentric to the pivot of said gates constructed and arranged to form a side wall for an inlet to said water-wheel.

10. The combination with a water-wheel, of a plurality of gates each having a cross member interposed between its pivot and the axis of said water-wheel, said cross member being provided with an inner working face constructed and arranged to form a side wall to one of the inlets with said water-wheel, said inner face being curved on an arc which will cut a line radial to the axis of said wheel always at the same point.

11. The combination with a water-wheel, of a plurality of pivoted gates provided with overlapping members having inner faces concentric to the pivots of said gates, said concentric faces serving to direct the inflow substantially in the same direction at any opening of said gates.

812,507. **SURGICAL OPERATING-ENGINE.** WILLIAM H. LUDEWIG, Rock Island, Ill. Filed Dec. 30, 1904. Serial No. 238,947.

Claim.—1. In an engine of the character specified, the combination of a pair of relatively movable members, a crank on one member, a reciprocating rod on the other member adapted to be actuated by said crank, and means for rotating said crank.

2. In combination, a pair of relatively movable members, a double crank on one member, a pair of reciprocating rods on the other member adapted to be actuated in opposite directions by said crank; and means for rotating said crank, substantially as and for the purpose set forth.

3. In combination, a member provided with a handle, a movable member, a crank on the first member, a reciprocatory rod on the movable member actuated by the crank, and means on the movable member adapted to operate the crank, substantially as set forth.

4. In combination, a member provided with a handle, a second member slidably supported on the first member, a double crank on the first member, a pair of reciprocatory rods on the movable member, respectively actuated by one of the cranks and means on the movable member adapted to operate the crank-shaft when moved toward the latter, substantially as set forth.

5. In combination, a relatively stationary part, a relatively movable part, a crank-shaft journaled on the stationary part, a driving-shaft journaled on the movable part, means for transmitting motion from the driving to the crank shaft when the former is moved toward the latter, and a reciprocating rod attached to the movable member and operated by the crank-shaft, substantially as described.

6. In combination, a relatively stationary part provided with a handle, a relatively movable part connected with the stationary part and supported thereby, a crank-shaft journaled on the stationary part, a driving-shaft journaled on the movable part, and gearing for transmitting motion from the driving to the crank shaft when the former is moved toward the latter; with a reciprocating rod attached to the movable member and adapted to be operated by the crank-shaft, and a tool-connecting device on the rod, substantially as described.

7. In combination, a member provided with a handle, a crank-shaft journaled in said member, and a gear on said shaft; a movable member projecting from the stationary member, a driving-shaft journaled on said movable member; opposed gears on said shafts, adapted to be brought into coöperative relation by moving the movable member toward the handle, means for normally separating the gears, a reciprocatory rod mounted on the movable member and operated by the crank-shaft, and means for connecting an instrument to said rod, substantially as described.

8. In combination, a hollow stationary member provided with a handle, a shaft journaled in said member having a crank on its inner end, and a gear on its outer end; a hollow movable member supported in and projecting from the stationary member, a driving-shaft journaled in said movable member, and a gear on said shaft adapted to contact with the gear on the crank-shaft when the movable member is drawn inward, a spring for normally separating the gears, and a reciprocatory bar mounted in said movable member and engaging the crank on the crank-shaft, and means for connecting an instrument to said rod, all substantially as and for the purpose described.

9. In combination, a stationary member provided with a handle and a tubular stud, a crank-shaft journaled in said stud, and a gear on said shaft; a movable member, a finger-piece on the movable member for drawing it toward the handle, a tubular stud on said movable member, a driving-shaft journaled therein; opposed gears on said shafts, adapted to be brought into coöperative relation by moving the movable member toward the handle, means for normally separating the gears, a pair of reciprocatory rods mounted in the movable member and operated by cranks on the crank-shaft, and means for connecting an instrument to one of said rods, substantially as described.

10. In combination, a hollow stationary member provided with a handle, a tubular stud projecting from said member, a shaft journaled in said stud and having cranks on its inner end within the member, and a frictional gear on its outer end; a hollow movable member supported in and projecting from the stationary member, a finger-piece depending from said movable member, a laterally-projecting hollow stud on said member, a driving-shaft journaled in said stud, and a frictional gear on said shaft adapted to contact with the gear on the crank-shaft when the movable member is drawn inward, a spring for normally separating the gears, and a pair of reciprocatory bars mounted in said movable member and engaging the opposite cranks on the crank-shaft, and means for connecting an instrument to one of said rods, all substantially as and for the purpose described.

11. In an engine of the character specified, the combination of a tool-operating member, a driven shaft, means for operating the said member from said shaft; and a support for said parts adapted to be held in the hand; with a driving-shaft also mounted on said support, gears for transmitting motion from the driving-shaft to the driven shaft, means for holding said gears normally out of contact, and a finger-actuated device whereby the gears may be moved into operative contact, substantially as set forth.

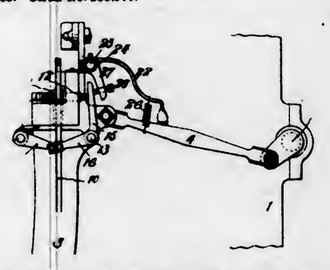
12. In combination, a member provided with a handle, a rotatable shaft journaled on said member, a second member connected with said first member, a rotatable shaft on the second member, gears on said shafts adapted to be brought into operative contact by relative bodily movement of the members, a tool-actuating rod or shaft, and means for operating said rod from the first-mentioned shaft, substantially as and for the purpose described.

13. In combination, a member provided with a handle, a rotatable shaft journaled on said member, a second member slidably connected with said first member, a rotatable shaft on the second member, gears on said shafts adapted to be brought into operative contact by moving one member upon the other, a spring interposed between said members to keep the said gears apart, a tool-actuating rod mounted in said members, and for operating said rod from the first-mentioned shaft, substantially as and for the purpose described.

14. In combination, a member provided with a handle, a laterally-projecting shaft journaled on said member having a gear on its outer end; a second member movably mounted on the first member and having a laterally-projecting shaft, and a gear on said shaft, said gears being brought into operative relation by moving the members relatively, a spring for separating said gears, and a tool-actuating rod actuated by said first-mentioned shaft, substantially as and for the purpose described.

15. In combination, a member provided with a handle, and a laterally-projecting sleeve, a shaft journaled in said sleeve having a gear on its outer end; a second member slidably mounted upon the first member and having a depending finger-piece and a laterally-projecting sleeve, a shaft journaled in said sleeve, and a gear on said shaft, said gears being brought into operative relation by moving the latter member upon the first member, a spring for separating said gears, and a reciprocating tool-actuating rod actuated by said first-mentioned shaft, substantially as and for the purpose described.

812,508. **LOOM.** WILLIAM J. LUTTON, Paterson, N. J. Filed May 5, 1905. Serial No. 258,977.



Claim.—1. In a loom, a lay, its shuttle-box, a shuttle, a drive-shaft, a pitman connecting the shaft and lay, a binder, a spring-arm carried thereby and means operated by the pitman engaging the spring-arm for causing it to clamp the shuttle within its box at predetermined points in the movement of the lay.

2. In a loom, a lay, its shuttle-box, a shuttle, a drive-shaft, a pitman connecting the shaft and lay, a binder, a spring-arm carried thereby, and an operating-lever having one arm engaged by the pitman and its other arm in position to force the spring-arm inwardly to cause the binder to yieldingly clamp the shuttle in its box at predetermined points in the movement of the lay.

3. In a loom, a lay, its shuttle-box, a shuttle, a drive-shaft, a pitman connecting the shaft and lay, a binder, a spring-arm carried thereby, a spring-actuated rock-lever having one arm engaging the spring binder-arm and an operating-lever having one arm engaged by the pitman and its other arm arranged to engage the arm of the said spring-actuated rock-lever for causing the binder to yieldingly clamp the shuttle within its box at predetermined points in the movement of the lay.

4. In a loom, a lay, its shuttle-boxes, binders therefor, a shuttle, a drive-shaft, a pitman connecting the drive-shaft and lay, a spring-actuated rock-lever having arms engaging the binders and an operating-lever having one arm engaging the pitman and another arm arranged to engage one of the arms of the rock-lever for causing either one of the binders to clamp the shuttle in the box in which it is located at predetermined points in the movement of the lay.

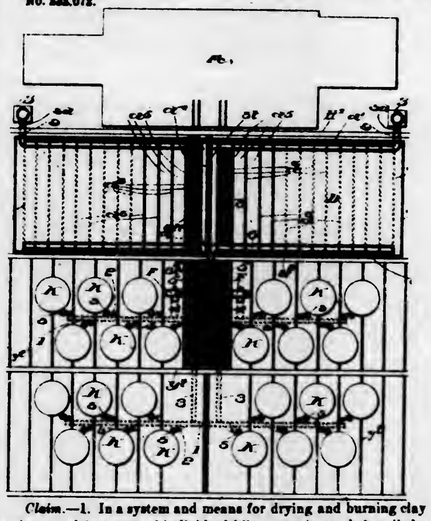
5. In a loom, a lay, its shuttle-boxes, their binders, spring-arms carried thereby, a shuttle, a drive-shaft, a pitman connecting the shaft and lay, a spring-actuated rock-lever having arms engaging the spring binder-arms and means operated by the pitman engaging one of the rock-lever arms for causing the rock-lever to yieldingly press the two binders into position to clamp the shuttle in the box in which it is located at predetermined points in the movement of the lay.

6. In a loom, a lay, its shuttle-boxes, binders therefor, spring-arms carried thereby, a shuttle, a drive-shaft, a pitman connecting the shaft and lay, a spring-actuated rock-lever having its arms engaged with the spring binder-arm and an operating-lever having one arm engaged by the pitman and its other arm in position to engage one of the rock-arms for causing the rock-lever to force the binders inwardly to clamp the shuttle in the box in which it is located at predetermined points in the movement of the lay.

7. In a loom, a lay, its shuttle-box, a shuttle, a drive-shaft, a pitman connecting the shaft and lay and adjustable means operated by the pitman for clamping the shuttle in its box at predetermined points in the movement of the lay.

8. In a loom, a lay, its shuttle-box, a shuttle, a drive-shaft, a pitman connecting the shaft and lay, a binder and adjustable means operated by the pitman for causing the binder to clamp the shuttle within its box at a predetermined point in the movement of the lay.

812,509. **SYSTEM AND MEANS FOR DRYING AND BURNING CLAY PRODUCTS.** ROBERT W. LYLE, New York, N. Y., assignor to William James Lyle, South River, N. J. Filed Nov. 10, 1904. Serial No. 232,672.



Claim.—1. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main stack for all the products of combustion of the entire set of kilns, a flue extending through the drier and connecting the kilns with said main service-stack common to the set, an adjunct or supplementary stack for each of the individual kilns, and cut-off means for isolating the respective individual kilns from the set, the kilns having no connection with the main stack except through the drier.

2. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main stack for all the products of combustion of the entire set of kilns, a flue extending through the drier and connecting the kilns with said main service-stack common to the set, an adjunct or supplementary stack for each of the individual kilns, and means for closing said supplementary stacks, the kilns having no connection with the main stack except through the drier.

3. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main stack for all the products of combustion of the entire set of kilns, a flue extending through the drier and connecting the kilns with said main service-stack common to the set, an adjunct or supplementary stack for each of the individual kilns, cut-off means for isolating the respective individual kilns from the set, and means for closing said supplementary stacks, the kilns having no connection with the main stack except through the drier.

4. In a system and means for drying and burning clay products, a drier, a kiln having a main outlet for its products of combustion, said main outlet being in connection with the drier, an adjunct or supplementary stack, and means for closing the latter, the kiln having no connection with said main outlet except through the drier.

5. In a system and means for drying and burning clay products, a drier, a kiln having a main outlet for its products of combustion, said main outlet being in connection with the drier, an adjunct or supplementary stack, and closure means at the top portion of the lat-

tor, the kiln having no connection with said main outlet except through the drier.

6. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main stack for all the products of combustion of the entire set of kilns, a flue extending through the drier and connecting the kilns with said main service-stack common to the set, an adjunct or supplementary stack for each of the individual kilns, closure means for said supplementary stacks, and closure means for the main stack.

7. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main stack for the set, a flue extending through the drier and connecting the kilns with said main service-stack common to the set, an adjunct or supplementary stack for each of the individual kilns, cut-off means for isolating the respective individual kilns from the set, closure means for said supplementary stacks, and closure means for the main stack.

8. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main products-of-combustion flue for the set, said flue being in connection with the drier, branch products-of-combustion flues extending from the individual kilns to said main flue, and means for isolating a section of the draft-channel of said branch flues and closing said isolated section at both ends while the kiln is under fire.

9. In a system and means for drying and burning clay products, a drier, a set of individual kilns, a main products-of-combustion flue for the set, said flue being in connection with the drier, branch products-of-combustion flues extending from the individual kilns to said main flue, two dampers in said branch flues, and a manhole-chamber between said dampers, for the purpose set forth.

10. In a system and means for drying and burning clay products, a kiln system, a flue for carrying all the products of combustion of the kiln system and leading to a main stack, an adjunct or supplementary stack for each kiln of the system, a drier, and heat-radiating flues communicating with said products-of-combustion flue and having a portion contained within the drier and externally closed, whereby all the products of combustion from the kiln system pass through the drier without access to its interior, the kilns having no connection with said main stack except through the drier.

11. In a system and means for drying and burning clay products, a kiln system, a main stack therefor, an adjunct or supplementary stack for each kiln of the system, a flue for carrying all the products of combustion of the kiln system extending between the latter and the stack, a drier intermediate the kiln system and its stack, and heat-radiating flues comprised in the products-of-combustion flue and having a portion contained within the drier and externally closed, the kilns having no connection with said main stack except through the drier.

12. In a system and means for drying and burning clay products, a kiln system, a main stack therefor, an adjunct or supplementary stack for each kiln of the system, a flue for carrying all the products of combustion of the kiln system extending between the latter and the stack and externally closed throughout its length, and a drier intermediate the kiln system and its stack and containing a portion of said flue, the kilns having no connection with said main stack except through the drier.

13. In a system and means for drying and burning clay products, a kiln system, a flue for carrying all the products of combustion of the kiln system and leading to a main stack, an adjunct or supplementary stack for each kiln of the system, a drier, and heat-radiating flues communicating with said products-of-combustion flue and extending longitudinally of the chambers or tunnels of the drier and externally closed within the drier, whereby all the products of combustion from the kiln system pass longitudinally through the chambers or tunnels of the drier without access to the interior thereof, the kilns having no connection with said main stack except through the drier.

14. In a system and means for drying and burning clay products, a kiln system, a main stack therefor, an adjunct or supplementary stack for each kiln of the system, a flue for carrying all the products of combustion of the kiln system, a drier, heat-radiating flues communicating with said products-of-combustion flue and extending longitudinally within the drier at the ends of the drying chambers or tunnels and externally closed, and heat-radiating flues communicating with said end flues and extending longitudinally of the chambers or tunnels of the drier and externally closed.

15. In a system and means for drying and burning clay products, a set of kilns, a flue for carrying all the products of combustion of the set of kilns, a main stack for said flue, a drier, heat-radiating flues communicating with said products-of-combustion flue and having a portion contained within the drier and externally closed, adjunct or supplementary stacks for each of the respective kilns, and means for isolating the respective kilns from the main products-of-combustion flue, the kilns having no connection with the main stack except through the drier.

16. In a system and means for drying and burning clay products, a kiln system, a main stack therefor, an adjunct or supplementary stack for each kiln of the system, a drier intermediate the kiln system and its stack, and flues for carrying all the products of combustion of the kiln system extending between the latter and its stack and passing through the drier and having the portion within the drier externally closed.

17. In a system and means for drying and burning clay products, a set of individual kilns, a products-of-combustion flue extending from said set of kilns, means for isolating the individual kilns from said flue, forced-draft means communicating with said flue, a drier, heat-radiating flues communicating with said products-of-combustion flue and having a portion contained within the drier and externally closed, a main stack communicating with said products-of-combustion flue beyond the drier, and an adjunct or supplementary stack for each kiln, the kilns having no connection with said main stack except through the drier.

18. In a system and means for drying and burning clay products, a set of individual kilns, a products-of-combustion flue extending from said set of kilns, means for isolating the individual kilns from said flue, adjunct or supplementary stacks for each of the individual kilns, means for closing said stacks, forced-draft means communicating with said products-of-combustion flue, a drier, heat-radiating flues communicating with said products-of-combustion flue and having a portion contained within the drier and externally closed, and a main stack communicating with said products-of-combustion flue beyond the drier.

19. An improved system and means for drying and burning clay products, comprising a drier, a flue extending through the drier, kilns, a main service-stack in connection with the terminal end of the drier-flue and constituting the only stack-outlet in common for the kilns, a flue extending in common from the kilns to the initial end of the drier-flue and constituting the only connection between the kilns and said main service-stack, and an individual or supplementary stack for the respective kilns whereby the kilns may be individually operated independent of said main service-stack and independent of the kilns which are collectively operating through the drier and said main service-stack.

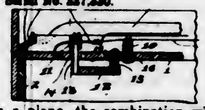
20. An improved system and means for drying and burning clay products, comprising a drier, a flue extending through the drier and externally closed within the drier, kilns, a main service-stack in connection with the terminal end of the drier-flue and constituting the only stack-outlet in common for the kilns, a flue extending in common from the kilns to the initial end of the drier-flue and constituting the only connection between the kilns and said main service-stack, and an individual or supplementary stack for the respective kilns whereby the kilns may be individually operated independent of said main service-stack and independent of the kilns which are collectively operating through the drier and said main service-stack.

21. An improved system and means for drying and burning clay products, comprising a drier, a flue extending through the drier and terminating at the rear thereof, kilns at the front of the drier, a main service-stack at the rear of the drier and in direct connection with the terminal rear end of the drier-flue and constituting the only stack-outlet in common for the kilns, a flue extending in common from the kilns to the initial end of the drier-flue and constituting the only connection between the kilns and said main service-stack, and an individual or supplementary stack for the respective kilns whereby the kilns may be individually operated independent of said main service-stack and independent of the kilns which are collectively operating through the drier and said main service-stack.

22. An improved system and means for drying and burning clay products, comprising a drier, a flue extending through the drier, kilns, a main service-stack in connection with the terminal end of the drier-flue and constituting the only stack-outlet in common for the kilns, a flue extending in common from the kilns to the initial end of the drier-flue and constituting the only connection between the kilns and said main service-stack, an individual or supplementary stack for the respective kilns whereby the kilns may be individually operated independent of said main service-stack and independent of the kilns which are collectively operating through the drier and said main service-stack, and forced-draft means in connection with the flue constituting the main outlet in common for the kilns and intermediate between the kilns and the main service-stack.

23. An improved system and means for drying and burning clay products, comprising a drier, a flue extending through the drier, kilns, a main service-stack in connection with the terminal end of the drier-flue and constituting the only outlet in common for the kilns, a flue extending in common from the kilns to the initial end of the drier-flue and constituting the only connection between the kilns and said main service-stack, and means for independently isolating the respective kilns from the drier-flue and the main service-stack and from the kilns which are operating in connection with the drier-flue and said main service-stack and for operating said isolated kilns independent of the main service-stack and the drier and entirely independent of the system of kilns discharging through the drier and said main service-stack.

812,510. **PIANO-BRIDGE.** FRANK MEYER, Oak Park, Ill. Filed Oct. 5, 1904. Serial No. 227,230.



Claim.—1. In a piano, the combination with the sounding-board of two string-supporting bridges spaced apart as to their string-engaged edges but connected to the sounding-board at the same common location, or substantially so.

2. In a piano, the combination with the sounding-board and sets of bass and treble strings, of a bass-string bridge and a treble-string bridge, both of said bridges having vibration-imparting engagement with the sounding-board at substantially the same place.

3. In a piano, the combination with the sounding-board and supporting-frame therefor, of a treble bridge applied to one side of said sounding-board at a point removed from the margin of the board, a bass bridge arranged between the treble bridge and margin of the board, and supporting devices connected with said bass bridge extending through openings in the sounding-board and connected with the opposite side of the latter at a location substantially coincident with the location of engagement therewith of the treble bridge.

4. In a piano, the combination with the sounding-board and supporting-frame therefor, of a bridge applied to one side of said sounding-board and supporting one set of strings, a second bridge arranged to support a second set of strings at a location removed from said first bridge, and supporting devices connected with said second bridge extending through the sounding-board and arranged in vibration-transmitting engagement with the opposite side of the sounding-board at a location substantially coincident with the engagement therewith of the first-named bridge.

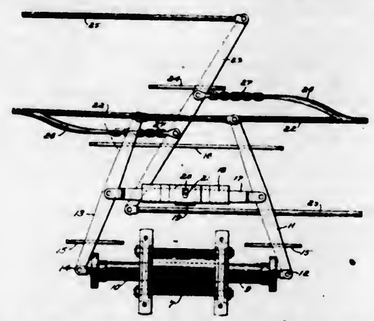
5. In a piano, the combination of a sounding-board, a marginal frame supporting said board, a string-supporting frame connected with said marginal frame, a set of treble strings connected with a part of the string-supporting frame which overhangs the sounding-board, a set of bass strings connected with the marginal portion of said string-supporting frame, a treble bridge interposed between the treble strings and sounding-board and having direct bearing with the latter, a bass bridge supporting the bass strings, and a bracket supporting said bass bridge and having its foot portion connected with the sounding-board substantially in register with the line of engagement of the treble bridge.

6. In a piano, the combination of a sounding-board, a marginal frame supporting said board, a string-supporting frame connected with said marginal frame, a set of treble strings connected with a part of the string-supporting frame which overhangs the sounding-board, a set of bass strings connected with the marginal portion of said string-supporting frame, a treble bridge interposed between the treble strings and sounding-board and having direct bearing with the latter, a bass bridge supporting the bass strings, and a bracket supporting said bass bridge and having its foot portion connected with the sounding-board substantially in register with the line of engagement of the treble bridge but at the opposite side of the board, substantially as described.

7. In a piano, the combination with a sounding-board and supporting-frame therefor, of a treble bridge applied to one side of said sounding-board at a location removed from the margin of the board, a bass bridge arranged between the treble bridge and proximate margin of the board and a supporting-frame connected with said bass bridge extending freely through the sounding-board and connected to the under side of the latter at a location removed from and inside of the bass bridge.

812,511. **ELECTROMAGNET.** ROBERT H. MILLER, Lancaster, Pa., assignor of two-thirds to John W. Holman and Charles V. Rote, Lancaster, Pa. Filed Apr. 26, 1904. Serial No. 204,662.

Claim.—1. A solenoid having two or more coils at each side of its center, similar terminals of the center coils being electrically connected and the opposite terminal of one of said center coils being electrically connected with a dissimilar terminal of an outer coil, the latter having its other terminal connected with the feed-wire.



2. A solenoid having two or more coils at each side of its center with similar terminals of its center coils electrically connected, the opposite terminal of one of said center coils being electrically connected with a dissimilar terminal of an outer coil, and the latter having its other terminal connected with the feed-wire; the center and outer coil at the opposite side of the magnet also having similar terminals electrically connected.

3. A solenoid comprising a series of coils with electrical connections between similar terminals of the center coils and oppositely-movable reciprocating cores working in an opening through the centers of the coils.

4. A solenoid having a series of coils arranged in corresponding groups at each side of the center of the magnet with similar terminals of the center coils electrically connected together, and oppositely-movable reciprocating cores fitted in an opening through the centers of the coils.

5. A solenoid having a series of coils encircling a central opening, a pair of oppositely-movable reciprocating cores fitted in said opening, and electrical connections between similar terminals of successive coils for completing a circuit through the several coils.

6. A solenoid comprising a plurality of coils at each side of its center, and a core in two parts adapted to approach each other when the solenoid is energized, the center coils having similar terminals connected and an opposite terminal of one of said center coils connected with a similar terminal of one of the outer coils, dissimilar terminals of the opposite center and outer coils being connected, and the opposite terminal of the latter coil being connected with the feed-wire, substantially as described.

812,512. **GRAMOPHONE.** HERBERT S. MILLS, Chicago, Ill. Filed May 3, 1905. Serial No. 258,635.

Claim.—1. In combination with the reproducer-head of a gramophone, a clamp adapted to hold an attenuate wire forming a stylus, comprising as one member, a finger on said head, and, as the other member, a body, longitudinally channeled on its inner side, fitting about and coöperating with said finger and provided with means for fastening it thereon.

2. In combination with the reproducer-head of a gramophone, a bracket on said head, and a clamp adapted to hold an attenuate wire forming a stylus, comprising, as one member, a finger projecting from said bracket, and, as the other member, a body longitudinally channeled to coöperate with said finger and provided with eyes through which to insert said wire, and with means for fastening the two members together.

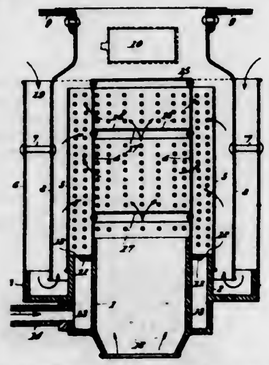
3. In combination with the reproducer-head of a gramophone, a bracket on said head, and a clamp adapted to hold an attenuate wire forming a stylus, comprising, as one member, a finger projecting from said bracket and provided on its outer end with a lip, and, as the other member, a body longitudinally channeled to coöperate with said finger and provided with lips containing eyes through which to insert said wire and with means for fastening the two members together.

4. In combination with the reproducer-head of a gramophone, a bracket on said head, and a clamp adapted to hold an attenuate wire forming a stylus, comprising, as one member, a finger projecting from said bracket and provided on its outer end with a lip, and, as the other member, a body longitudinally channeled to coöperate with said finger and provided with eyes through which to insert said wire and with a yoke forming a bearing containing a set-screw and surrounding said finger to connect therewith the channeled member.

5. In combination with the reproducer-head of a gramophone, a bracket on said head and a clamp adapted to hold an attenuate wire forming a stylus, comprising, as one member, a finger projecting from said bracket and provided with a recess near its inner end and a lip on its outer end, and, as the other member, a body longitudinally channeled to coöperate with said finger and provided with a lip near one end to enter said recess and with a lip on its opposite end to overlap the lip on said finger, the lips on said channeled member containing eyes through which to insert said wire, and means for fastening the two members together.

6. In combination with the reproducer-head of a gramophone, a bracket on said head, and a clamp adapted to hold an attenuate wire forming a stylus, comprising, as one member, a finger projecting from said bracket and provided with a recess near its inner end and a lip on its outer tapered end, and, as the other member, a body bifurcated at one end and longitudinally channeled to coöperate with said finger and provided with a lip near said end to enter said recess and with a lip on its opposite end to overlap the lip on said finger, the lips on said channeled members containing eyes through which to insert said wire, and a yoke forming a bearing containing a set-screw and surrounding said finger to connect the members together.

812,513. APPARATUS FOR BURNING GAS. LUIGI MORENO and ARMIDO D'ANTONI, Turin, Italy. Filed Feb. 27, 1905. Serial No. 247,636.

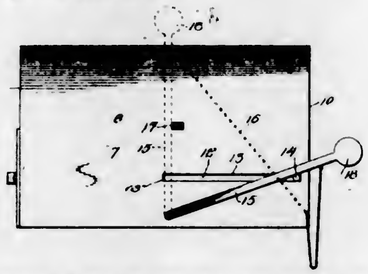


Claim.—1. In combination, a body portion open at both ends, galleries formed around the body portion and each other, a cylinder secured at one end to the outer gallery and having its opposite end open to the atmosphere, a second cylinder arranged within the first-named cylinder and supported thereby, one end of said second cylinder extending within and terminating above the bottom of the outer gallery, the opposite end of said second cylinder being in communication with a draft-pipe, a perforated cylinder secured to the inner gallery within the second cylinder, a second perforated cylinder secured at one end to the body portion and arranged within the first perforated cylinder, said second perforated cylinder having its opposite end closed, baffle-plates within the second perforated cylinder, and a supply-pipe communicating with the inner gallery.

2. In combination, a body portion open at both ends, galleries formed around the body portion and each other, a cylinder secured at one end to the outer gallery and having its opposite end open to the atmosphere, a second cylinder arranged within the first-named cylinder, and supported thereby, one end of said second cylinder being in communication with a draft-pipe, a perforated cylinder secured to the inner gallery within the second cylinder, a second perforated cylinder secured at one end to the body portion and arranged within the first perforated cylinder, said second perforated cylinder having its opposite end closed, baffle-plates within the second perforated cylinder, and a plate carried by the body portion extending toward but not contacting with the outer wall of the first gallery and a supply-pipe communicating with the first gallery.

3. In combination, a body portion open at both ends, galleries formed around the body portion and each other, a cylinder secured at one end to the outer gallery and having its opposite end open to the atmosphere, a second cylinder arranged within the first-named cylinder, and supported thereby, one end of said second cylinder being in communication with a draft-pipe, a perforated cylinder secured to the inner gallery within the second cylinder, a second perforated cylinder secured at one end to the body portion and arranged within the first perforated cylinder, said second perforated cylinder having its opposite end closed, perforated baffle-plates within the second perforated cylinder, a plate carried by the body portion extending toward but not contacting with the outer wall of the first gallery, a supply-pipe communicating with the first gallery and means for regulating the flow of fluid through the supply-pipe.

812,514. MAIL-BOX. DAVID W. MORROW, Plumville, Pa. Filed Aug. 4, 1905. Serial No. 272,666.



Claim.—1. A mail-box comprising a body portion, a drawer slidably disposed in the body portion, a signal pivotally connected with the body portion and means carried by the drawer for moving the signal when the drawer is moved outwardly of the body portion, said signal-moving means being also arranged to prevent entire withdrawal of the drawer from the body portion.

2. A mail-box comprising a body portion having a slotted wall, a drawer slidably disposed within the body portion, a projection carried by the drawer and extending outwardly of the slot, said projection being movable in the slot when the drawer is slid, a signal-arm movable over the slot and a signal carried by the arm, said projection being arranged for engagement with the signal to move the latter when the drawer is moved.

3. A mail-box comprising a body portion, a drawer slidably disposed within the body portion, a signal-arm pivoted to the body portion, a signal carried by the arm said signal being movable into and out of operative position, means for holding the signal yieldably in operative position and means for moving the signal into operative position when the drawer is moved outwardly of the body portion.

4. A mail-box comprising a body portion having a slot in one of its walls, a drawer slidably disposed in the body portion, a projection carried by the drawer and extending outwardly of the slot said projection being slidable in the slot when the drawer is slid, a signal-arm pivoted to the slotted wall of the body portion for movement to extend upwardly at one end of the slot or to lie across the slot in engagement with the projection, said projection being arranged to move the arm into its upwardly-extending position when the drawer is moved outwardly of the body portion, said projection being also adapted for engagement of the forward end of the slot to hold the drawer against complete withdrawal from the body portion.

5. A mail-box comprising a body portion having a horizontal slot in one wall, a drawer slidably disposed within the body portion and having a projection adjacent to its rearward end extending into the slot, an arm pivoted to the wall and lying in the path of movement of the projection, said projection being adapted for engagement of the arm to move it forwardly upon its pivot, a plate pivoted to the drawer and lying within the slot, a spring-finger secured to the plate and extending outwardly through the slot, said plate lying at times forwardly of the arm, a plate located at the forward end of the slot and extending thereover and arranged to receive the spring-finger against its inner surface to hold said finger inwardly of the plane of the arm to permit of movement of the plate and finger rearwardly independently of the arm, said arm having a groove therein arranged to receive the spring-finger in its rearward end and to move the spring-finger and the plate upwardly to direct them into the portion of the slot lying above the second-named plate and forwardly of the arm.

6. A mail-box comprising a body portion, a signal-arm pivoted to the body portion and movable into and out of operative position upon its pivot, a signal carried by the arm, a drawer slidably mounted in the body portion, means carried by the drawer for moving the arm into operative position when the drawer is moved outwardly, means carried by the drawer for moving the arms into inoperative position when the drawer is moved inwardly and means for holding the second-named means at times in inoperative position.

812,515. PICTORIAL POST-CARD. KARL MÜNSTER, Munich, Germany, assignor to The Firm of Becker & Kolbinger, Munich, Germany. Filed Oct. 26, 1905. Serial No. 284,486.

Claim.—1. A pictorial post-card comprising a slide, a strip secured thereto and adapted to receive pictures, and a cover hinged to the slide and overlying the strip, in combination with a case arranged to contain said slide.

2. A pictorial post-card comprising a slide, a strip secured thereto and adapted to receive pictures, a cover hinged to the slide and arranged to overlie the strip, and an elastic member tending to open the cover, in combination with a case arranged to contain said slide.

3. A pictorial post-card comprising a slide, a strip secured thereto and adapted to receive pictures, a cover hinged to the slide and arranged to overlie the strip, and an elastic member tending to open the cover, in combination with a case arranged to contain said slide, and a connection between the case and slide to prevent the total withdrawal of the latter.

4. A pictorial post-card comprising a slide, a strip secured upon each side of the center and adapted to receive pictures, and a two-part cover hinged to the center of said slide and arranged to overlie the two strips, in combination with a case arranged to contain the slide.

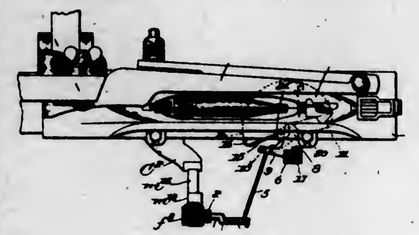
5. A pictorial post-card comprising a slide, a strip secured upon each side of the center and adapted to receive pictures, and a two-part cover hinged to the center of said slide and arranged to overlie the two strips, an elastic connecting the two parts of the hinged cover, in combination with a case arranged to contain the slide.

6. A pictorial post-card comprising a slide, a strip secured upon each side of the center and adapted to receive pictures, and a two-part cover hinged to the center of said slide and arranged to overlie the two strips, an elastic connecting the two parts of the hinged cover under tension, in combination with a case arranged to contain the slide and open at both ends, and a connection between the case and the slide arranged to limit the withdrawal of the slide to the hinged portion thereof.

7. A pictorial post-card comprising a slide, a folded strip secured thereto on each side of the center and adapted to receive pictures, a two-part cover hinged to the center of the slide and arranged to overlie the folded strips, and an elastic member connecting the two parts of the cover and tending to hold them open, in combination with a case open at both ends and arranged to contain the slide with its covers closed over the folded strips, and a flexible connection between the interior of the case and the slide of a length sufficient to limit the withdrawal of the slide to the hinged portion thereof.

812,516. SHUTTLE-CLEARING MEANS FOR FILLING-REPLENISHING LOOMS. JONAS HOCHSTADT, Hopedale, Mass., assignor to Draper Company, Hopedale, Mass., a Corporation of Maine. Filed June 8, 1905. Serial No. 264,520.

Claim.—1. In a loom, in combination, automatic filling-replenishing mechanism, and means, actuated by said mechanism upon operation thereof, to engage, draw out of the shuttle, and positively hold the old filling end as the ejected filling-carrier leaves the shuttle.



2. In a loom, in combination, automatic filling-replenishing mechanism, and means, actuated by said mechanism upon operation thereof, to engage, draw out of the shuttle, and positively hold the old filling end as the ejected filling-carrier leaves the shuttle.

3. In a loom, in combination, automatic filling-replenishing mechanism, and means actuated thereby to clear the shuttle of the old filling end, said means including a clearer member movable in a lateral path, and a fixed fulcrum on which said member is mounted.

4. In a loom, in combination, automatic filling-replenishing mechanism, and means to automatically clear the shuttle of the old filling end, said means including a clearer member angularly movable in a path below the shuttle and intersecting the path of an ejected filling-carrier, and a fixed fulcrum on which said member is mounted.

5. In a loom, in combination, automatic filling-replenishing mechanism, a normally quiescent clearer member angularly movable in a substantially horizontal plane below the shuttle and intersecting the path of an ejected filling-carrier, and operating connections between said member and the replenishing mechanism, whereby said member is caused to engage the old filling end between the ejected filling-carrier and the shuttle, upon filling replenishment, and draw such filling end out of the shuttle.

6. In a loom, in combination, automatic filling-replenishing mechanism, a bracket mounted on the loom, a clearer member fulcrumed on said bracket, and means actuated by operation of the replenishing mechanism to cause said clearer member to swing upon its fulcrum and engage the old filling end between the shuttle and the ejected filling-carrier and draw the filling end out of the shuttle.

7. In a loom, in combination, automatic filling-replenishing mechanism, and automatic means to engage, draw out of the shuttle and positively hold the old filling end as the ejected filling-carrier leaves the shuttle, said means including a fixed member, and a movable clearer member to engage the old filling end and move it against the fixed member, and hold it.

8. In a loom, in combination, automatic filling-replenishing mechanism, and automatic means to engage, draw out of the shuttle and positively hold the old filling end as the ejected filling-carrier leaves the shuttle, said means including a fixed member, and a coöperating member fulcrumed at one end thereof and movable automatically upon filling replenishment to engage and move the old filling end against the fixed member, to be held between said members.

9. In a loom provided with automatic filling-replenishing mechanism, means to clear the old filling end from the shuttle, said means including a swinging clearer member movable in a lateral path below the shuttle, a fixed fulcrum for said member, a spring to move said member into engagement with the old filling end between the shuttle and the ejected filling-carrier and draw such filling end from the shuttle, and connections between the replenishing mechanism and the clearer member to set the latter when said mechanism is operated.

10. In a loom, in combination, automatic filling-replenishing mechanism, means to part the old filling between the cloth and shuttle upon filling replenishment, a fixed support, and a clearer member fulcrumed thereon and operatively connected with the replenishing mechanism, to engage the parted filling end between the shuttle and the ejected filling-carrier and draw such filling end out of and thereby clear the shuttle.

11. In a loom provided with automatic filling-replenishing mechanism, and with means to part the old filling between the cloth and shuttle upon filling replenishment, the combination of means to clear the shuttle of the parted filling end, said means including a clearer member angularly movable in a path below the shuttle during filling replenishment, a fixed fulcrum for said member, and actuating de-

vices to swing said member into engagement with and behind the parted filling end between the shuttle and the filling-carrier from which it leads.

6. In a filter, the combination of a series of annular sheet-metal distributer-plates having corrugations running from the perimeter suitably spaced with relation thereto, the corrugations of said plates sheet-metal collector-plates arranged in alternation therewith and affording surface channels on both sides thereof, screens adjacent to

driven gears respectively, and revolved planetwise around the same with the said case; a controller for the fulcrum-gear, and means for

vices to swing said member into engagement with and behind the parted filling end between the shuttle and the filling-carrier from which it leads.

12. In a loom provided with automatic filling-replenishing mechanism, and with means to part the old filling between the cloth and shuttle upon filling replenishment, the combination of means to clear the shuttle of the parted filling end, said means including a horizontally-swinging clearer member, a fixed member, and devices to swing the clearer member into engagement with the parted filling end between the shuttle and the ejected filling-carrier during filling replenishment and carry the filling end into holding engagement with the fixed member, to cause the filling end to be drawn out of the shuttle.

13. In a loom provided with automatic filling-replenishing mechanism, and with means to part the old filling between the cloth and shuttle upon filling replenishment, the combination with a lay having a replenishing shuttle-box through which the ejected filling-carrier is discharged, of a clearer member automatically swung rearward and then forward beneath the said shuttle-box during filling replenishment, to pass behind the parted filling end above the ejected filling-carrier and then pull such filling end out of the shuttle.

14. In a loom provided with automatic filling-replenishing mechanism, and with means to part the old filling between the cloth and shuttle upon filling replenishment, the combination with a horizontally-swinging clearer member movable below the shuttle, a fixed fulcrum for said member, and a spring to effect swinging movement of the latter behind and to pull forward the parted filling end, of means to retract or set the clearer member against the action of the spring and to thereafter release it, during filling replenishment, whereby the clearer member can engage and draw from the shuttle the parted filling end.

15. In a loom, in combination, automatic filling-replenishing mechanism, a lay having a replenishing shuttle-box, and means to automatically engage and positively hold the old filling end below the shuttle-box when a filling-carrier has been discharged therethrough, to thereby draw the filling end away from and clear the shuttle.

16. In a loom, automatic filling-replenishing mechanism, including a rocking transferrer, a fixed support, a clearer member fulcrumed thereon to swing in a curved path below the shuttle during filling replenishment, to engage the old filling end between the shuttle and the ejected filling-carrier and clear such filling end from the shuttle, and a controlling connection between the clearer member and the transferrer.

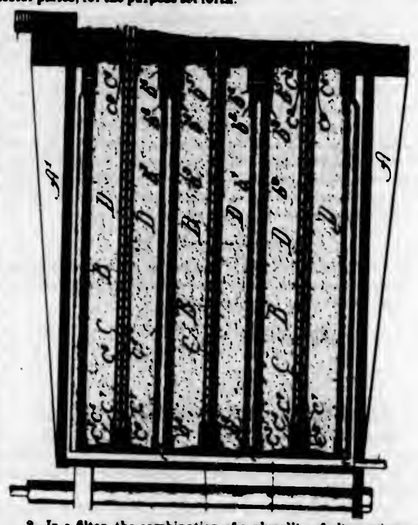
17. In a loom, in combination, filling-replenishing mechanism, including an automatically-operated transferrer, a depending, fixed bracket having a lateral foot below the lay-path, a clearer member fulcrumed on the inner end of said foot, a spring to move said member across the path of a filling-carrier ejected during filling replenishment, to engage the old filling end and pinch it against the foot, and an operative connection between the transferrer and the clearer member, to position the latter and then release it during the movement of the transferrer.

18. In a loom, automatic filling-replenishing mechanism, including a rocking transferrer having a depending extension, a fixed support, a spring-operated clearer member fulcrumed thereon to swing in a substantially horizontal path below the shuttle during filling replenishment and across the path of the ejected filling-carrier, to engage the old filling end and cause its withdrawal from the shuttle, and a cam-hook on the clearer member adjacent its fulcrum, and a link connecting the hook and the transferrer extension, operation of the transferrer acting through the link to first retract or set, and then quickly release the clearer member to enable the latter to swing behind and engage the old filling end between the shuttle and the ejected filling-carrier, the cam-hook effecting the quick release of the clearer member when set.

19. In a loom provided with automatic filling-replenishing mechanism, means to cause the operation thereof prior to complete exhaustion of the running filling, and means to part the old filling between the cloth and shuttle upon filling replenishment, combined with means the operation whereof is effected by actuation of the replenishing mechanism to engage, and positively hold the parted filling end between the shuttle and the ejected filling-carrier and thereby clear such filling end from the replenished shuttle.

812,517. **FILTER.** JOHN T. H. PAUL, Chicago, Ill., assignor to B. Goldman & Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 11, 1905. Serial No. 277,906.

Claim.—1. In a filter, the combination of a plurality of corrugated sheet-metal distributer-plates and corrugated imperforate suitably spaced with relation thereto, the corrugations of said plates sheet-metal collector-plates arranged in alternation therewith and affording surface channels on both sides thereof, screens adjacent to the sides of said plates, filter material massed between the collector and distributer screens, and ingress and egress passages in communication respectively with the passages of the distributer and collector plates, for the purpose set forth.



2. In a filter, the combination of a plurality of alternating corrugated sheet-metal distributer and collector plates having channels on both sides, screens protecting said channels, filter masses between the screens in the spaces between the distributer and collector plates, tube-sections forming a central conduit and connected with the distributer and collector plates, sleeves connected with the circumferential portions of one set of plates, and a casing forming an annular conduit with the cells thus constructed, the channels of the distributer-plates communicating with one conduit and the channels of the collector-plates communicating with the other conduit.

3. In a filter, the combination with a series of distributers, of a series of alternating collectors, each collector comprising an annular corrugated sheet-metal plate having circular corrugations and radial corrugations intersecting the same and running to the center, the corrugations affording channels at both sides of the plates, tube-sections flanking the inner margin of each collector-plate, sleeves provided internally medially with means attached to the circumferential portions of the collector-plates, screens flanking each collector-plate and fitting within the circumferential sleeves, filter material massed in the spaces between the distributers and the collector-plate screens, and ingress and egress conduits communicating with the distributers and collectors, respectively.

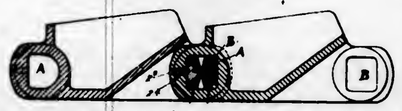
4. The combination of a series of collectors and a series of distributers alternating therewith, each distributer comprising an annular corrugated sheet-metal plate, the corrugations affording channels on both sides of the plates extending from the circumference to near the central opening, tube-sections having central external circumferential flanges secured to the inner margins of said plates, tube-sections connected with the collectors and forming with the first-named tube-sections an egress-conduit, circumferential sleeves connected with the collectors and in substantial contact with the outer margins of the distributers, and a casing forming with the cells thus constructed an annular ingress-conduit, the distributer-channels being in communication with the ingress-conduit, for the purpose set forth.

5. The combination of corrugated sheet-metal distributer-plates with channels on both sides thereof, corrugated sheet-metal collector-plates alternating therewith and having channels on both sides, relatively coarse mesh perforate sheet-metal screens flanking each distributer, perforate relatively fine mesh sheet-metal screens protecting the collector-plates, filter masses in the spaces between the screens, and a central and an annular conduit in communication, one with the channels of the distributer-plates, and the other with the channels of the collector-plates, for the purpose set forth.

6. In a filter, the combination of a series of annular sheet-metal distributer-plates having corrugations running from the perimeter toward the center, tube-sections having central external flanges connected with the inner margins of said plates, a series of annular sheet-metal collector-plates having circular corrugations intersected by relatively large radial corrugations leading to the center, sleeves having internal medial flanges connected with the outer margins of the collector-plates, screens flanking the distributer-plates, screens flanking the collector-plates, tube-sections flanking the inner margins of the collector-plates, filter masses in the spaces between the screens, and a casing forming with the cells thus formed an annular conduit, for the purpose set forth.

7. The combination of corrugated sheet-metal distributer-plates with surface channels on both sides thereof, corrugated sheet-metal collector-plates alternating therewith and having surface channels on both sides formed by the corrugations, certain of said channels of said collector-plates being substantially radial, screens flanking said plates, filter masses in the spaces between the screens, and a central and an annular conduit in communication, one with the channels of the distributer-plates and one with the channels of the collector-plates, for the purpose set forth.

812,518. **DREDGE-BUCKET COUPLING.** HARRY G. PEAKE and JAMES HENDERSON, Oroville, Cal., assignors to W. P. Hammon, Oroville, Cal. Filed May 4, 1905. Serial No. 258,853.

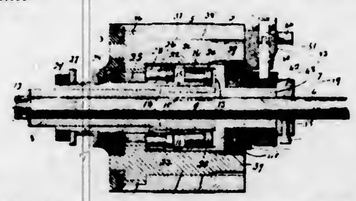


Claim.—1. An antifrictional contact-surface consisting of a block fixed in one of the connected parts and a pin fixed in the other, said block and pin having surfaces of contact adapted to rock upon each other.

2. The combination in a dredge of buckets having eyes at front and rear, pins extending through said eyes and fixed therein, said pins having rolling contact-surfaces and blocks fixed in the opposing eyes having similar surfaces upon which the pin has a bearing.

3. In a dredge, buckets having eyes at the front and rear, blocks set in the rear eye of each bucket having the front surface made higher at the center than at the edges, pins extending through the front eyes of the buckets having corresponding surfaces contacting and rolling upon the block-surfaces, and means for securing said pins in the eyes.

812,519. **POWER-TRANSMITTING MECHANISM.** JOSEPH PETRELLI, New Haven, Conn., assignor to The Snow & Petrelli Mfg. Co., New Haven, Conn., a Corporation. Filed Mar. 11, 1905. Serial No. 249,630.



Claim.—1. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and arranged concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the said fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof, and for transmitting the movement of the said driven gear to the said shaft for the rotation thereof by the said gear.

2. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and arranged concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the said fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof and for transmitting the movement of the said driven gear to the said shaft for the reverse rotation thereof thereby.

3. In a power-transmitting mechanism, the combination with a rotatable case having a concentric hub, of a driven shaft, a fulcrum-gear mounted upon the said hub, a driven gear differentiated in size with respect to the said fulcrum-gear and concentric therewith, a driving-pinion and a driven pinion, differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively, and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof, and for transmitting the movement of the said driven gear to the said shaft for the rotation thereof thereby.

4. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and arranged concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the said fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a friction-brake whereby the said fulcrum-gear is retarded or stopped, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof, and for transmitting the movement of the said driven gear to the said shaft for the rotation thereof thereby.

5. In a power-transmitting mechanism, the combination with a rotatable case having a concentric hub, of a driven shaft, a fulcrum-gear mounted upon the said hub, a relatively smaller driven gear arranged concentric therewith, a driving-pinion and a relatively larger driven pinion rotating together on the same axis, meshing directly into the said fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof, and for transmitting the movement of the said driven gear to the said shaft for the reverse rotation thereof thereby.

6. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and arranged concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof, and for transmitting the movement of the said driven gear to the said shaft for the reverse rotation thereof thereby.

7. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and arranged concentric with the said case and shaft, the said fulcrum-gear being formed with a hub, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller applied to the hub of the said fulcrum-gear, and means for transmitting the rotatable movement of the said case to the said shaft for the direct rotation thereof and for transmitting the movement of the said driven gear to the said shaft for the rotation thereof by the said gear.

8. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, and clutch mechanism located between the said gears for coupling the shaft with the case and with the said driven gear.

9. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-

gear, and a sliding coupling-sleeve mounted upon the said shaft and carrying coupling instrumentalities whereby the sleeve, and hence the shaft, are coupled with the case for the rotation of the shaft therewith, and with the driven gear for the rotation of the shaft thereby.

10. In a power-transmitting mechanism, the combination with a rotatable case, of a driven-shaft, a fulcrum-gear and a driven gear differentiated from each other in size and concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, a coupling-sleeve having sliding movement on the said shaft, a coupling-collar fixed upon the said sleeve and adapted to be coupled with the case whereby the shaft is rotated therewith, a coupling-collar combined with the said driven gear and coacting with the coupling-collar before mentioned for coupling the driven gear with the said sleeve, and means for longitudinally moving the said sleeve to couple the case with the sleeve or the sleeve with the driven gear.

11. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, a sleeve mounted to slide on the said shaft and projecting outward through the case, coupling instrumentalities mounted upon the said sleeve for coupling the same with the case or with the driven gear as desired, and means applied to the projecting outer end of the sleeve for operating the same.

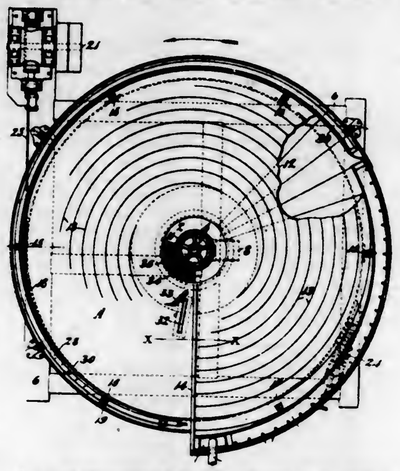
12. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear arranged concentric with the said case and shaft and formed with a hub, a controller for the said gear applied to the said hub, a sleeve mounted on the shaft to slide thereupon, a relatively small driven gear mounted upon the said sleeve, a driving-pinion and a relatively large driven pinion mounted in the case, rotating together on the same axis, meshing directly into the fulcrum and driven gears respectively and revolved planetwise around the same with the said case, whereby the said driven gear is reversely rotated; coupling instrumentalities carried by the said sleeve whereby the shaft is coupled with the case or with the driven gear as desired, and means for operating the said sleeve.

13. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a relatively small driven gear concentric with the said case, a shaft, a driving-pinion and a relatively large driven pinion rotating together on the same axis, meshing directly into the said fulcrum and driven gears respectively, and revolved planetwise around the same with the said case, whereby the driven gear is reversely rotated; a controller for the said fulcrum-gear, a sleeve mounted to slide upon the said shaft, coupling-pins carried by the said case, a coupling-collar fixed upon the said sleeve and provided with coupling-pins for coacting with the pins before mentioned, a coupling-collar rigid with the said driven gear, coupling-pins mounted therein, coupling-pins mounted in the collar on the sleeve for coaction with the coupling-pins last mentioned, and means applied to the projecting outer end of the sleeve for operating the same.

14. In a power-transmitting mechanism, the combination with a rotatable case, of a driven shaft, a fulcrum-gear and a driven gear differentiated from each other in size and arranged concentric with the said case and shaft, a driving-pinion and a driven pinion differentiated in size, rotating together on the same axis, meshing directly into the said fulcrum and driven gears respectively and revolved planetwise around the same with the said case; a controller for the said fulcrum-gear, the said controller comprising a frame-plate, a friction band or strap, a bolt, and a handle connected with the said band and bolt for the operation thereof; and means for transmitting the rotatable movement of the said case to the said shaft for the forward rotation thereof, and for transmitting the movement of the said driven gear to the said shaft for the reverse rotation thereof thereby.

812,520. ORE-CONCENTRATOR. JOSEPH W. PIERCE, San Francisco, Cal. Filed Nov. 28, 1904. Serial No. 234,223.

Claim.—1. A concentrating-pan having a concaved upper surface and mounted upon a central support, said pan being essentially involute in outline, riffles on the surface of the pan, said pan having a central discharge, means located at the widest portion of the pan for delivering material upon the pan in the field of maximum agitation and means for giving the pan an oscillatory movement.



2. A concentrating-pan having a concaved upper surface and mounted on a central support, said pan being essentially involute in outline, spiral riffles on the pan and a feed-box arranged around the pan at substantially the point farthest removed from the central support, said pan having separate discharges for the values and worthless matter and means for giving the pan an oscillatory movement.

3. In a concentrator, a pan having a central discharge and a concaved riffled surface wherein the riffles commence at a common line which is radial to the pan said riffles terminating at irregular intervals around the pan, means for supporting the perimeter of the pan, means for supplying pulp to the pan at substantially the point farthest removed from the central discharge, and means for raising and lowering the center of the pan to vary its depth.

4. A concentrating-pan having a concaved upper surface essentially involute in outline, and having riffles on said surface commencing at a common line radial to the pan and terminating at irregular intervals around the pan, said pan composed of a series of sections rigidly supported at their outer ends, and flexibly supported at the center, means for raising and lowering the inner ends of said sections to vary the depth of the pan, means for delivering material upon the pan in the field of maximum agitation, and means for oscillating the pan.

5. A concentrating-pan having a concaved upper surface and a central opening, said pan having riffles on its surface commencing at a common line radial to the pan and terminating at irregular intervals around said pan, means for supporting the pan at the center and at its periphery to permit it to oscillate in a horizontal plane, said pan composed of a plurality of sectors flexibly supported at the center, means for raising the inner ends of these sectors to vary the depth of the pan, a flexible covering supported on these sectors, curved riffles supported on said covering, and means for delivering material upon the pan in the field of maximum agitation.

6. An ore-concentrating pan having a concaved upper riffled surface, with the riffles commencing at a common line which is substantially radial to the pan and terminating at irregular intervals around the pan said pan being essentially involute in outline and the surface of the pan lying in a spirally-descending plane.

7. An ore-concentrating pan having a concaved upper riffled surface, said pan being essentially involute in outline and the surface of the pan lying in a spirally-descending plane.

8. An ore-concentrating pan having a concaved upper riffled surface, said pan being essentially involute in outline and the surface of the pan lying in a spirally-descending plane, the pan having a central discharge, and means for delivering pulp at one or more points on said pan most remote from the center and in the field of maximum agitation of said pan.

9. An ore-concentrating apparatus comprising a shallow inverted conical pan having a central and movable peripheral supports, means by which said pan is abruptly oscillated about its center, means for discharging pulp and wash-water near the periphery of the pan, a series of spirally-disposed riffles fixed upon the surface of the pan, and each commencing at a common line which is substantially radial to the pan, said riffles terminating at irregular intervals around the pan, said surface declining in a curve from the commencement to the termination of the riffles, and separate discharge-openings for the concentrated mineral and the gangue.

10. An ore-concentrating apparatus comprising a shallow inverted conical pan having a central and movable peripheral supports, means by which said pan is abruptly oscillated about its center, means for discharging pulp and wash-water near the periphery of the pan in the field of maximum agitation, a series of spirally-disposed riffles fixed upon the surface of the pan, said riffles and each commencing at a common line which is substantially radial to the pan, said riffles terminating at irregular intervals around the pan, declining in a curve from the commencement to the termination of the riffles, said pan having a separate discharge for the gangue and radially-extending openings in the body of the pan in the path of the values for the separate discharge and collection of the latter.

11. In a concentrator, a shallow horizontally-supported concaved pan having a flexible bottom said pan being essentially involute in outline, vertical standards upon which the periphery of the pan is supported and movable, a central post with socket-sleeve cap and screw whereby the center of the pan may be raised or lowered, spirally-disposed riffles upon the surface of the pan, means for delivering pulp and wash-water at the outer periphery thereof in the field of maximum agitation, and mechanism by which a circular oscillatory movement of the pan is effected.

12. In an ore-concentrator, a circular pan having a concaved upper riffled surface with the riffles commencing at a common point substantially radial to the pan and terminating at irregular points around the pan, and a flexible bottom, means for supporting the outer periphery of the pan, said means including standards loosely pivoting in sockets in the bed-frame and pivotally engaging corresponding parts on the pan, springs relative to said standards and operating to hold the pan to its seat, a central support for the pan and means for raising and lowering the center of the pan to vary its depth.

13. An ore-concentrating pan having essentially the outline of an involute and arranged with its upper surface in a spirally-descending plane, a partition extending from the center of the pan outwardly at the highest point of the surface of the same, and curved riffles extending around the pan in the direction of the decline of curvature, means for delivering pulp and wash-water on the pan in substantially the field of maximum agitation and separate discharges for the gangue and values.

14. An ore-concentrating pan having essentially the outline of an involute and arranged with its upper surface in the plane of a turn of a conical helix, a radial partition extending from the center of the pan outwardly at the highest point of the surface of the same and curved riffles extending around the pan in the direction of the decline of curvature, means for delivering material onto the pan at the widest part thereof, and separate discharges for the gangue and values.

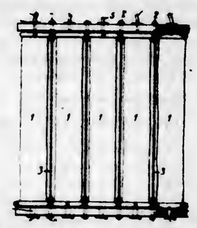
15. An ore-concentrating pan having essentially the outline of an involute and arranged with its upper surface in the plane of a turn of a conical helix, a radial partition extending from the center of the pan outwardly at the highest point of the surface of the same and curved riffles extending around the pan in the direction of the decline of curvature, a curved segmental feed-trough disposed at the outer edge of the pan at its widest part, said pan having a central discharge for the gangue and having discharge-passages intermediate of its center and periphery for the values.

16. In a concentrator, a circular concaved pan having an upper riffled surface arranged in a spirally-descending plane and a central discharge, means for delivering material upon the pan, said pan having a discharge-passage for the values intermediate of its center and periphery, said passage extending transverse to the general direction of movement of the values.

17. In a concentrator, a circular pan having a concaved upper riffled surface and a central opening, a bowl in said opening having a discharge for the gangue and a separate screen-covered receptacle for the finer slimes passing over the pan, means for supporting the bowl, means for supporting the outer periphery of the pan, means for delivering material and wash-water upon the pan, said pan having a discharge for the concentrated values intermediate of its center and periphery and means for giving the pan an oscillatory movement.

812,521. APPARATUS FOR RAISING SUBMERGED OBJECTS. CATERINA PINO, Genoa, Italy. Filed June 5, 1903. Serial No. 160,579.

Claim.—1. A float for raising submerged objects, comprising a series of flexible tubular cells, two platforms or heads to both of which each of said cells is attached, flexible connections for determining the distance between said heads when the said cells are extended, means attached to the upper head for guiding and holding the float in position and means for attaching said float to the submerged object.



2. A float for raising submerged objects comprising a top and a bottom platform, a series of cells of waterproof flexible material arranged in series of rows between said platforms, means arranged between said rows for determining the distance between said platforms when the cells are extended and means for inflating said cells.

3. A float for raising submerged objects, comprising a series of waterproof flexible tubular cells arranged in parallel rows, platforms or heads between which said cells are secured, flexible connections located between said rows of cells for limiting the distance between said heads, when the cells are extended, each of said heads being provided with openings which communicate with the interior of said cells, the openings in the upper head being provided with means for connecting the supply-pipes and the openings in the lower heads being provided with check-valves for the discharge of water.

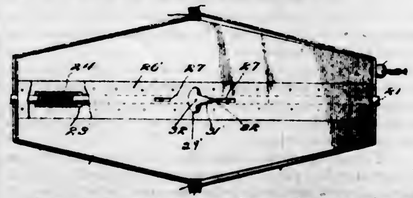
4. A float for raising submerged objects comprising dividing heads or platforms, means for securing a series of flexible inflatable tubular cells to said heads in parallel rows, flexible means arranged between said rows of tubular cells for limiting the separation of said heads, means for inflating said cells through openings in said heads, and a check-valve carried by said heads for allowing the water to be discharged.

5. A float for raising submerged objects, comprising heads or platforms, a plurality of flexible tubular cells of waterproof material having their open ends attached to said heads, flexible connections arranged between said heads or platforms and between said cells for limiting the said separation of the heads, means for forcing a fluid into said cells, and check-valves for allowing the escape of water from said elements.

6. A float for raising submerged objects, comprising a plurality of superposed series of parallel waterproof cells, platforms or heads between said series of cells, and to which the ends of said cells are attached, flexible connections for determining the distance between said heads when said cells are extended, means attached to the upper head for guiding and holding the float in position, and means connected to the lower head for attaching said float to a submerged object.

7. A float for raising submerged objects, comprising a plurality of superposed series of parallel waterproof cells, platforms or heads between said series of cells, and to which the ends of said cells are attached, flexible connections for determining the distance between said heads when said cells are extended, and separate air-conduits connected independently to each series of cells.

812,522. TRAP. JAMES B. PITTMAN, Goldhill, Colo. Filed Feb. 16, 1905. Renewed Dec. 26, 1905. Serial No. 293,230.



Claim.—1. A trap comprising a base, spring-actuated cooperating jaws carried by the base, a pair of bolt-bars slidably mounted in the base and movable into and out of position to engage the jaws when the latter are separated, means for holding the bolt-bars nor-

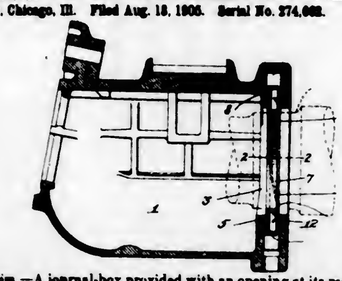
mally inactive and a trigger removably disposed between the ends of

bedded in the concrete so as to reinforce the structure about such

mally inactive and a trigger removably disposed between the ends of the bolt-bars and adapted to hold them in active positions.

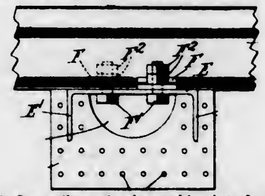
2. A trap comprising a base having laterally-directed trunnions, jaws having terminal spring portions connected to the trunnions and adapted to stand yieldably in gripping relation, bolt-bars slidably mounted in the base in position to engage and hold the jaws in inactive relation, means for holding the bolt-bars yieldably in inactive positions, and a removable trigger disposed between the ends of the bolt-bars and adapted to hold them in inactive positions, such trigger being adapted for attachment of bait thereto.

812,523. **DUST-GUARD FOR JOURNAL-BOXES.** EDWARD POSSON, Chicago, Ill. Filed Aug. 18, 1905. Serial No. 274,602.



Claim.—A journal-box provided with an opening at its rear end and having a vertical recess adjacent to said opening and also having a raised smooth flat bearing, 5, in said recess and continuous around said rear opening; a dust-guard comprising a single plate perforated to receive the axle snugly and having at one side a smooth face, 8, which is broader than the said raised flat bearing on the box, and at the other side having recesses each with two parallel sides, and a spring, 15, in each of the said recesses, said spring being held in position by fitting between the two parallel sides.

812,524. **CONCRETE RAILWAY-TIE.** WILLIAM H. PRUYN, Jr., Chicago, Ill. Filed Feb. 13, 1905. Serial No. 245,263.



Claim.—1. In a railway-tie, the combination of a body part of concrete-like material with a rail-seating part to which the rail is secured, the body part being cut away giving access to the under side of the rail-seating part.

2. In a railway-tie, the combination of a body part of concrete-like material, with a relatively thin rail-seating part to which the rail is secured, the body part being channeled giving access to the under side of the rail-seating part.

3. In a railway-tie, the combination of a body part of concrete-like material with a rail-seating part which is relatively thin and of tougher structure, the body part being channeled in proximity to the rail-seating part.

4. In a railway-tie, the combination of a body part of concrete-like material with a seating part to which the rail is secured, the body part being channeled in proximity to the seating part, and means for securing the rail to such tie.

5. In a railway-tie, the combination of a body part of concrete-like material with a rail-seating part to which the rail is secured, the body part being channeled in proximity to such rail-seating part, perforations through such seating part, and securing devices extending through the perforations.

6. In a railway-tie, the combination of a body part of concrete-like material with a rail-seating part comprising a metallic member, a part of which is embedded in the concrete of the body, the body part of such tie being channeled beneath said seating part.

7. In a railway-tie, the combination of a body part of concrete-like material, such body part being channeled, with a rail-seating part extending over such channel comprising a metallic member embedded in the concrete so as to reinforce the structure about such channeling.

8. In a railway-tie, the combination of a body part of concrete-like material with a seating part to which the rail is secured, the body part being channeled beneath the seating part, and means for securing the rail to such tie comprising a clamping device engaging the rail-flange and a bolt to secure such clamping device to the rail-seat.

9. In a railway-tie the combination of a body part with a relatively thin rail-seating part to which the rail is secured, the seating part disposed with reference to the body part so that the under side of the seating part is readily accessible for fastening the rail.

10. In a railway-tie the combination of a body part apertured so as to form a relatively thin rail-seating part with its under side accessible, and metal reinforcements for such seating part.

11. In a railway-tie the combination of a body part apertured so as to form a relatively thin rail-seating part with its under side accessible, and metal reinforcements for such seating part embedded in the concrete forming the tie.

12. In a railway-tie the combination of a body part apertured so as to form a relatively thin rail-seating part with its under side accessible, and metal reinforcements for such seating part embedded in the concrete and extending about such aperture.

13. In a railway-tie the combination of a body part apertured so as to form a relatively thin rail-seating part with its under side accessible, and metal reinforcements for such seating part extending through the seating part and anchored in the body part at each side of the aperture.

14. In a railway-tie the combination of a body part of concrete-like material with a rail-seating part to which the rail-securing devices are fastened, and a thin reinforcing portion for the seating part entirely embedded in the concrete thereof.

812,525. **TRANSPARENT SIGN.** JOHN M. RATHMAN, St. Louis, Mo. Filed Aug. 16, 1905. Serial No. 274,452.

Claim.—1. A sign comprising a suitable background, and readable lens-shaped characters disposed in front of the same, substantially as set forth.

2. A sign comprising a suitable diaphanous background, and readable lens-shaped diaphanous characters of a contrasting color disposed in front of the same, substantially as set forth.

3. A sign comprising a suitable box, a diaphanous plate forming a wall thereof and constituting a suitable background, means for introducing artificial light behind said plate, and a series of diaphanous readable lens-shaped characters of a contrasting color disposed on the outer face of the background, substantially as set forth.

812,526. **GARMENT-SUPPORTER.** VICTOR H. RAA, Elgin, Ill. Filed Nov. 22, 1904. Serial No. 233,956.

Claim.—1. A device of the kind described, comprising the combination of supporting means provided with means for attaching the same to a garment, the said supporting means consisting of two members, one of said members provided with an aperture and a hook and the second member arranged to extend through said aperture and engage said hook with a suitably-flexible material positioned between the members, said members being otherwise unattached.

2. A garment-supporter, comprising a member provided with an aperture, and having a hook positioned near one end of said aperture, in combination with a coöperating bodily-movable member adapted to extend through said aperture and provided with a bar arranged to engage said hook to secure a part of a garment between the members, and means to support said members in said coöperating portion.

3. In a garment-supporter, a member provided with an aperture, and a hook positioned near one end of said aperture, in combination with a second member, adapted to extend through said aperture and engage said hook, to support a garment by engaging a portion thereof between said members, and means for normally loosely connecting said members together whereby they are bodily movable relative to one another.

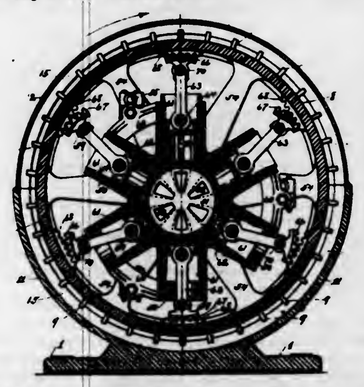
4. In a garment-supporter, a member provided with an aperture, and having a longitudinally-extended hook positioned on its front side near its free end, in combination with a second member, normally suspended at the back of said first member and provided with a transverse bar, said members bodily movable with respect to one another being adapted to coöperate to engage a suitably-flexible material between them by positioning the second member and a portion of said material through said aperture in the first member and engaging said bar with said hook.

5. In a garment-supporter, a member provided with an aperture, and having a hook positioned near one end of said member freely movable relative to said first-mentioned member, in combination with a second member provided with a curved bar adapted to coöperate with said hook to engage a suitably-flexible material, when said second member and a portion of said material is positioned through the aperture in said first member.

6. In a fastener of the character described, coöperating engaging parts bodily movable with respect to one another, the one part comprising an open frame having a hook-shaped projection on one side thereof and the other part comprising an open frame adapted to pass through the opening of the frame of the coöperating part and engage under the hook carried thereby.

7. In a fastener of the character described, a flexible support coöperating engaging parts unconnected save by said support, the one member comprising an open frame having a hook-shaped projection on one side thereof and the other part comprising an open frame adapted to slide through the opening of the frame of the coöperating part and engage under the hook carried thereby.

812,527. **RECIPROCATING ROTARY ENGINE.** FREDERICK W. REEVES, Allegheny, Pa., assignor to The Reeves Centrifugal Engine Company, Pittsburg, Pa., a Corporation of the District of Columbia. Filed Aug. 27, 1904. Serial No. 223,378.



Claim.—1. In a steam-engine, a plurality of cylinders revoluble about the same axis and provided with reciprocating pistons, a rotatable wheel the axis of which is parallel with but out of line with the revoluble axis of said cylinders, members yieldingly connected to said piston and said wheel, means carried by the said wheel and outer extremities of said members and engaging one another, the point of engagement therebetween being at all times in direct line with the centers of the cylinders and the axis upon which they revolve irrespective of their positions, semicircular bearings carried by said wheel, and laterally-disposed members carried by said pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

2. In a steam-engine, a plurality of cylinders revoluble about the same axis and provided with reciprocating pistons, adapted to receive and exhaust steam at one end, a rotatable wheel the axis of which is parallel with but out of line with the revoluble axis of said cylinders, members yieldingly connected to said piston and said wheel, and means carried by the said wheel and outer extremities of said members and engaging one another, the point of engagement therebetween being at all times in direct line with the centers of the cylinders and the axis upon which they revolve irrespective of their positions.

3. In a steam-engine, a plurality of cylinders revoluble about the same axis and provided with reciprocating pistons, a rotatable wheel the axis of which is parallel with but out of line with the revoluble axis of said cylinders, members yieldingly connecting said cylinders with said wheel, members yieldingly connected to said piston and said wheel, and means carried by the said wheel and outer extremities of said members and engaging one another, the point of engagement therebetween being at all times in direct line with the centers of the cylinders and the axis upon which they revolve irrespective of their positions.

4. In a steam-engine, a plurality of cylinders revoluble about the same axis and provided with reciprocating pistons adapted to receive and exhaust steam at one end, a rotatable wheel the axis of which is parallel with but out of line with the revoluble axis of said cylinders, members yieldingly connecting said cylinders with said wheel, members yieldingly connecting to said piston and said wheel, means carried by the said wheel and outer extremities of said members and engaging one another, the point of engagement therebetween being at all times in direct line with the centers of the cylinders and the axis upon which they revolve irrespective of their positions, semicircular bearings carried by said wheel, and laterally-disposed members carried by said pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

5. In a steam-engine, a revoluble member carrying a plurality of radially-disposed cylinders each communicating with a valve-cavity located at the revoluble axis of said member, a receiving and exhaust valve mechanism located in said cavity, reciprocating pistons in cylinders, a revoluble wheel the axis of which is out of line but parallel with the revoluble axis of said cylinder member, members yieldingly connected to said piston and said wheel, means carried by the said wheel and outer extremities of said members and engaging one another, the point of engagement therebetween being at all times in direct line with the centers of the cylinders and the axis upon which they revolve irrespective of their positions, semicircular bearings carried by said wheel, and laterally-disposed members carried by said pitman-rods and engaging said bearings, adapted to main tain the said rods in operative engagement with said wheel.

6. In a steam-engine, a revoluble member carrying a plurality of radially-disposed cylinders each communicating at one end with a valve-cavity located at the revoluble axis of said member, a receiving and exhaust valve mechanism located in said cavity, reciprocating pistons in said cylinders, a revoluble wheel the axis of which is out of line but parallel with the revoluble axis of said cylinder member, members yieldingly connected to said piston and said wheel, semicircular bearings carried by said wheel, and laterally-disposed members carried by the pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

7. In a steam-engine, a revoluble member carrying a plurality of radially-disposed cylinders each communicating with a valve-cavity located at the revoluble axis of said member, a receiving and exhaust valve mechanism located in said cavity, reciprocating pistons in said cylinders, a revoluble wheel the axis of which is out of line but parallel with the revoluble axis of said cylinder member, members yieldingly connecting said cylinders with said wheel, members yieldingly connected to said piston and said wheel, semicircular bearings carried by said wheel, and laterally-disposed members carried by the pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

8. In a steam-engine, a revoluble member carrying a plurality of radially-disposed cylinders each communicating at one end with a valve-cavity located at the revoluble axis of said member, a receiving and exhaust valve mechanism located in said cavity, reciprocating pistons in said cylinders, a revoluble wheel the axis of which is out of line but parallel with the revoluble axis of said cylinder member, members yieldingly connecting said cylinders with said wheel, members yieldingly connected to said piston and said wheel, means carried by the said wheel and outer extremities of said members and engaging one another, the point of engagement therebetween being at all times in direct line with the centers of the cylinders and the axis upon which they revolve irrespective of their positions, semicircular bearings carried by said wheel, and laterally-disposed members carried by said pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

9. In a steam-engine, rotatable cylinders provided with reciprocating pistons, a rotatable wheel the axis of which is out of line but parallel with that of said cylinders, members yieldingly connecting

said wheel with said cylinders, whereby a uniform rotary motion is established, a casing inclosing said wheel, a circumferential groove formed within said casing and means connected to said wheel whereby a lubricating fluid entering said casing will be carried to said groove and distributed within said casing to the mechanism inclosed thereby.

10. In a steam-engine, rotatable cylinders provided with reciprocating pistons, a rotatable wheel the axis of which is out of line but parallel with that of said cylinders whereby a uniform rotary motion is imparted to said wheel and cylinders, a casing inclosing said wheel and cylinders, a circumferential groove formed within said casing, means connected to said wheel whereby a lubricant entering said casing will be carried to and distributed therein to the mechanism inclosed thereby by the centrifugal motion of said wheel, and a slush-box to receive the surplus lubricant and water arranged in connection with said casing, a reservoir connected to said slush-box, said reservoir being provided with an overflow or means for separating the water from the oil, and means for returning the lubricant collected therein to the casing.

11. In a steam-engine, rotatable cylinders provided with reciprocating pistons, a rotatable wheel the axis of which is out of line but parallel with that of said cylinders, a stationary valve provided with a movable governor-controlled cut-off member adapted to receive and exhaust steam therethrough and, a disk or piston connected with said valve carrying an exhaust-tube whereby compensating movement is permitted and a steam-balance is formed.

12. In a steam-engine, a valve having a movable governor-controlled cut-off member, cylinders rotating thereabout with ports leading therethrough adapted to successively receive and exhaust steam, a disk member or pitman loosely connected to said valve having an endwise movement, a steam-exhaust tube connected to said disk, a steam-inlet pipe surrounding said exhaust-tube, a non-conducting covering placed about said steam-inlet tube, and means for centrally locating said tube within said hollow shaft, whereby an air-passage is formed to keep said shaft cool.

13. In a steam-engine having a plurality of revoluble cylinders, a valve having a movable governor-controlled cut-off sector-valve operating within a recess formed within the same, a series of radially-arranged openings through the valve, said sector-valve operating to close said openings, whereby steam direct from the boiler may be cut off or supplied to said valve in radial series to the cylinders.

14. In a steam-engine having a plurality of revoluble cylinders, a valve having a movable governor-controlled sector-valve operating within a recess formed therein, means arranged to admit steam about said sector to balance the same and a series of radially-arranged openings through the valve, whereby steam direct from the boiler may be supplied to said valve and cylinders in radial series.

15. In a steam-engine, rotatable cylinders provided with reciprocating pistons adapted to receive and exhaust steam at one end thereof, a rotatable wheel the axis of which is out of line but parallel with that of said cylinders, and members yieldingly connecting said pistons and cylinders with the wheel, a valve provided with a sector operating therein and means whereby said valve and sector may be shifted and set to admit steam to the cylinders in opposite relation to reverse the rotatable motion of the engine.

16. In a steam-engine, a revoluble member carrying a plurality of radially-disposed cylinders each communicating with a valve-cavity located at the axis of said member, a stationary valve located in said cavity adapted to permit steam to enter into and exhaust from said cylinders, a governor-controlled cut-off-valve member operating in said valve, reciprocating pistons in said cylinders, a revoluble wheel the axis of which is parallel but out of line with that of said cylinder member, members yieldingly connecting said cylinders or member with said wheel, members yieldingly connected with said pistons and engaging with said wheel the points of contact with the wheel being at all times in direct line with the cylinders and the revoluble axis thereof irrespective of position, a casing inclosing said wheel and the cylinders and attending parts the periphery of which is provided with a groove, and members carried by said wheel whereby a lubricant placed therein will by the centrifugal motion of said wheel carry said lubricant about said casing and cause its distribution to the working parts inclosed by said casing.

17. In a steam-engine, a revoluble member carrying a plurality of radially-disposed cylinders each communicating with a valve-cavity located at the axis of said member, a stationary valve located in said cavity adapted to permit steam to enter into and exhaust from said cylinders, a governor-controlled cut-off-valve member operating in said valve, reciprocating pistons in said cylinders, a revoluble wheel the axis of which is parallel but out of line with that of said cylinder member, members yieldingly connecting said cylinders or members with said wheel, members yieldingly connected with said pistons and engaging with said wheel the points of contact with the wheel being at all times in direct line with the cylinders and the revoluble axis thereof irrespective of position, a casing inclosing said wheel and the cylinders and attending parts the periphery of which is provided with a groove, members carried by said wheel whereby a lubricant placed therein will by the centrifugal motion of said wheel carry said lubricant about said casing and cause its distribution to the working parts inclosed by said casing, a receptacle communicating with said casing to receive the surplus oil therefrom delivered therein by the said centrifugal motion of said wheel, and means communicating with said receptacle and casing to receive said surplus lubricant and resultant water from steam condensation and returning said lubricant to said casing.

18. In a steam-engine, a revoluble wheel, a member carrying a plurality of radially-disposed cylinders revoluble upon a hollow shaft whose center is out of line but parallel with that of said wheel which member is provided at its axis with a cavity communicating with said cylinders, a steam-supply tube extending through said shaft and communicating with said cavity, an exhaust-tube extending through said supply-tube, a valve arranged on said exhaust-tube and extending into said cavity, a governor-controlled cut-off-valve member operating in said valve, reciprocating pistons in said cylinders, members yieldingly connected with said pistons and engaging with said wheel the points of contact with the wheel being at all times in direct line with the cylinders and revoluble axis thereof irrespective of position, a casing inclosing said wheel the cylinders and attending parts the periphery of which is provided with a groove, and members carried by said wheel whereby a lubricant placed therein will by the centrifugal motion of said wheel carry said lubricant about said casing and cause its distribution to the working parts inclosed by said casing.

19. In a steam-engine, a revoluble wheel, a member carrying a plurality of radially-disposed cylinders revoluble upon a hollow shaft whose center is out of line but parallel with that of said wheel which member is provided at its axis with a cavity communicating with said cylinders, a steam-supply tube extending through said shaft and communicating with said cylinders, a steam-supply tube extending through said shaft and communicating with said cavity, an exhaust-tube extending through said supply-tube, a valve arranged on said exhaust-tube and extending into said cavity, a governor-controlled cut-off-valve member operating in said valve, reciprocating pistons in said cylinders, members yieldingly connected with said pistons and engaging with said wheel the points of contact with the wheel being at all times in direct line with the cylinders and revoluble axis thereof irrespective of position, a casing inclosing said wheel the cylinders and attending parts the periphery of which is provided with a groove, members carried by said wheel whereby a lubricant placed therein will by the centrifugal motion of said wheel carry said lubricant about said casing and cause its distribution to the working parts inclosed by said casing, a receptacle communicating with said casing to receive the surplus oil therefrom delivered therein by the centrifugal motion of said wheel, and means communicating with said receptacle and casing to receive said surplus lubricant and resultant water from steam condensation and returning said lubricant to said casing.

20. In a rotary engine of the class set forth provided with a revoluble member such as a wheel and inclosed within a casing, a peripheral groove in said casing, means carried by said revoluble member to carry the lubricant about said casing-groove, and conductors communicating with said groove and interior of the casing to convey the lubricant to the working parts inclosed by said casing.

21. In a rotary engine of the class set forth provided with a revoluble member such as a wheel and inclosed within a casing, a peripheral groove in said casing, means carried by said revoluble member to carry the lubricant about said casing-groove to permit distribution thereof to the working parts inclosed by said casing, a receptacle communicating with said casing to receive the surplus oil therefrom delivered therein by the centrifugal motion of said wheel, and means communicating with said receptacle and casing to receive said surplus lubricant and resultant water from steam condensation and returning said lubricant to said casing.

22. In an engine of the class set forth, the combination with the pitman-rods and wheel, of rockers on the outer ends of the said pitmen, and contacting members therefor carried by said wheel, semicircular bearings carried by said wheel, and laterally-disposed members carried by said pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

23. In an engine of the class set forth, the combination with the pitman-rods and wheel, of rockers on the outer ends of the said pitmen, contacting members therefor carried by said wheel, means to maintain operative contact between said pitman-rockers and wheel members, semicircular bearings carried by said wheel, and laterally-disposed members carried by said pitman-rods and engaging said bearings, adapted to maintain the said rods in operative engagement with said wheel.

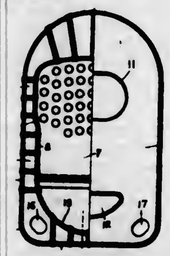
812,528. **PRUNING IMPLEMENT.** JOHN S. ROHRER, Lancaster, Pa. Filed Apr. 20, 1905. Serial No. 256,044.

Claim.—1. In pruning-shears, the combination of coöperating members, each comprising a suitable handle and blade, a pivotal connection between said members admitting of relatively slidable movement thereof, and a cam projection carried by one of the members and arranged to engage the other member to impart relative sliding movement to the members as the handles are pressed together.

2. In pruning-shears, the combination of coöperating members, each comprising a suitable handle and blade, a pivotal connection between said members admitting of relatively slidable movement thereof, an integral cam projecting from one of the members and engaging the other member to impart relative slidable movement to the members as the handles are pressed together, and an obliquely-disposed link connected at its opposite ends with the said members and coacting with the cam aforesaid to effect relative longitudinal sliding movement of the members as the handles are forced together.

3. Pruning-shears comprising pivotally-connected members normally pressed apart by spring action, each of said members consisting of a handle and blade, means for holding said members closed consisting of a headed pin projecting from the handle of one of the members, and a locking-slide secured to and slidable longitudinally of the handle of the other member and provided with a slot therein to receive the pin aforesaid and engage the head thereof.

812,529. **BOILER.** WILLIAM H. RUSSELL, Laporte, Ind. Filed Oct. 23, 1905. Serial No. 283,994.



Claim.—1. In a boiler, the combination, substantially as set forth, of a barrel, a throat-sheet, an outer door-sheet, a fire-box with its sides formed continuous with its floor, and a fire-box shell having its base formed continuous with its sides, the floor of the fire-box forming a semicircular curve with its concavity upward, and the base of the fire-box shell or casing joining the sides thereof by rounded corners presenting inward concavities, cleaning-openings being formed in the throat-sheet and outer door-sheet at the forward and rear extremities of the spaces formed between the floor of the fire-box and the base-corners of its shell.

2. In a boiler of locomotive type, the combination, substantially as set forth, of a fire-box with a concave floor formed continuous with its sides, a fire-box casing having a flat floor joining the sides of the casing by circular curves, a throat-sheet having rounded base-corners fitting the fire-box casing and having cleaning-openings at said corners, and an outer door-sheet having rounded base-corners fitting the casing and having cleaning-openings at said corners.

812,530. **SIDE PLATE FOR FILTERS.** CONSTANTINE P. SCHWARZ, Elyria, Ohio. Filed Oct. 9, 1905. Serial No. 281,902.

Claim.—1. As an article of manufacture, a filter-plate consisting of a series of sills supported on corrugated uprights, said sills being formed integral with said uprights.

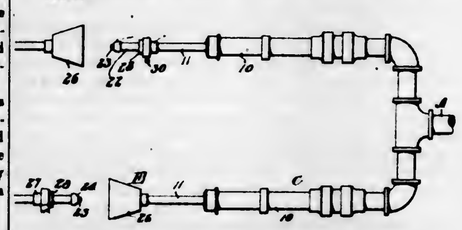
2. As an article of manufacture, a filter-plate consisting of a series of sills supported on corrugated uprights formed integral with said sills and the width of said sills being greater than the distance between said sills.

812,531. **FIGURED COVERING.** LUDWIG W. SEEGER, Ragubn, Germany. Filed Sept. 18, 1905. Serial No. 279,053.

Claim.—1. A composite covering for floors, walls, ceilings and the like consisting of a colored or figured base layer, and a colored or figured covering-tissue of fabric or textile material so united with the base layer that the coloring or figuring of the latter combines with that of the covering to form the complete figured or colored effect.

2. A composite covering for floors, walls, ceilings, and the like, consisting of a colored or figured base layer, and an open-mesh textile colored or figured covering tissue or fabric united to the base layer and arranged to expose therethrough the coloring or figuring of the base layer.

812,532. **AUTOMATIC AIR-PIPE COUPLING.** PIETRO SETTINO and PETER HOOVER, Steelton, Pa. Filed Oct. 31, 1905. Serial No. 285,300.



Claim.—1. In an automatic air-pipe coupling, casings arranged to be supported by the cars, each casing being provided with a valve-seat, a helical compression-spring within each casing, tubes arranged to slide within the casings, a valve carried by each tube and arranged to close against the valve-seat under the action of the spring, each tube having a lateral port through which fluid may be passed to or from the casing when the valve is unseated, a packing-ring arranged at the outer end of each casing and through which the tube slides, and mating members arranged at the outer ends of the tubes.

2. In an automatic train-pipe coupler, a coupling member including a pair of tubes having coupling-sleeves arranged to permit free play of one section of the tube, and a flexible lining within the coupling member to prevent the escape of air.

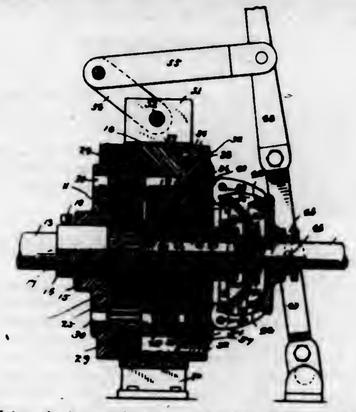
3. In an automatic train-pipe coupler, a coupling member including a pair of tubular sections having coupling-sleeves arranged to permit free movement of one section with respect to the other, an elastic sleeve arranged within the said coupling-sleeves, and a spring disposed within the elastic sleeve and tending to force the latter outward into engagement with the walls of the sleeves to prevent the escape of air.

4. In an automatic air-pipe coupler, a coupling member including a pair of alined tubes provided with interfitting sleeves, a clamping-ring for holding said sleeves together, and a lining member of flexible elastic material arranged within said sleeves.

5. In an automatic air-pipe coupler, intenengaging coupling members, one having a yieldable nipple, and the other a yieldable socket member for engagement with the nipple.

6. In an automatic train-pipe coupler, a male member having a nipple of yieldable material, and a female member having a ring or socket, also formed of yieldable material, and a guiding-funnel arranged in advance of said ring or socket.

812,533. REVERSING-GEAR. HENRY A. TUTTLE, South Norwalk, Conn., assignor to H. A. Tuttle Manufacturing Company, South Norwalk, Conn., a Corporation of Delaware. Filed Apr. 5, 1905. Serial No. 254,051.



Claim.—1. A reversing-gear comprising driving and driven shafts in line with each other and spur-gears at their contiguous ends, the gear on the driven shaft having an undercut recess and an elongated hub, a case having a bearing for said hub extending into said undercut recess means for locking the case against rotation, single pinions journaled in the case and engaging the driving-shaft gear and double pinions journaled in the case and engaging the single pinions and the driven-shaft gear.

2. A reversing-gear comprising driving and driven shafts in line with each other and spur-gears at their contiguous ends, the gear on the driven shaft having an undercut recess and an elongated hub, a case having a bearing for said hub extending into said undercut recess, single pinions journaled in the case and engaging the driving-shaft gear, double pinions journaled in the case and engaging the single pinions and the driven-shaft gear, a friction-disk carrier rigidly secured to said hub, friction-disks carried thereby, washers locked to the case and means for clamping the disks and washers together and against the case to lock the driven shaft thereto.

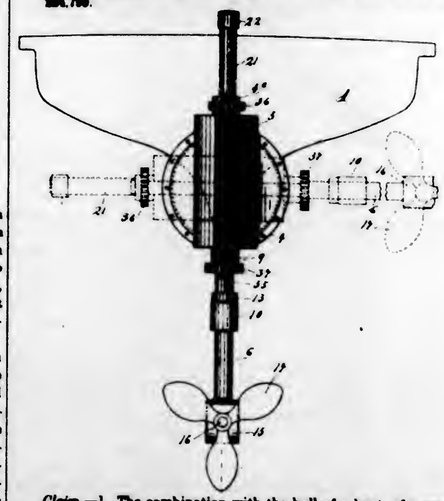
3. A reversing-gear comprising driving and driven shafts in line with each other and spur-gears at their contiguous ends, the driven-shaft gear having an elongated hub, a rotary case having a recess in its face, single pinions journaled in the case and engaging the driving-shaft gear, double pinions journaled in the case and engaging the single pinions and the driven-shaft gear, a friction-disk carrier rigidly secured to the hub, friction-disks and washers lying in the recess in the case and means for clamping the friction-disks and washers together and against the base-wall of the recess.

4. A reversing-gear comprising driving and driven shafts in line with each other and spur-gears at their contiguous ends, the driven-shaft gear having an elongated hub, a rotary case, single pinions journaled in the case and engaging the driving-shaft gear, double pinions journaled in the case and engaging the single pinions and the driven-shaft gear, a friction-disk carrier rigidly secured to the hub, friction-disks and a pressure-disk carried by said hub, washers locked to the case, an adjustable screw-collar on the driven shaft, bell-crank levers pivoted on the pressure-disk and engaging the screw-collar and a cone sliding on the driven shaft and acting on the bell-crank levers to clamp the pressure-disk, friction-disks and washers together and against the case.

5. A reversing-gear comprising driving and driven shafts in line with each other and spur-gears at their contiguous ends, a rotary case, single pinions journaled in the case and engaging the driving-shaft gear, double pinions journaled in the case and engaging the single pinions and the driven-shaft gear, a brake-band, an arm and intermediate connections for clamping the brake-band about the case, friction-disks carried by the driven shaft, washers locked to the case, an adjustable screw-collar, bell-crank levers engaging the screw-collar and acting on the friction-disks and washers, a cone sliding on the driven shaft and acting on the bell-crank levers, an operating-lever pivoted to the case and a link connecting the operating-lever and the arm, said operating-lever at its intermediate position holding both the brake-band and the friction devices loose, at one extreme of its movement clamping the brake-band and leaving the friction devices loose and at the other extreme of its movement clamping the friction-washers and leaving the brake-band loose.

6. A reversing-gear comprising driving and driven shafts in line with each other and spur-gears at their contiguous ends, a rotary case, single pinions journaled in the case and engaging the driving-shaft gear, double pinions journaled in the case and engaging the single pinions and the driven-shaft gear, friction-disks carried by the driven shaft, washers, pins engaging the washers and the case for locking the washers against rotation and means for clamping the friction-disks and washers together and against the case to lock the case to the driven shaft.

812,534. PROPELLER ATTACHMENT FOR ROWBOATS. EDWARD G. WALLOP, Minneapolis, Minn. Filed Sept. 17, 1904. Serial No. 224,799.



Claim.—1. The combination with the hull of a boat, of a propeller-support pivotally adjustable in an approximately vertical plane, extending transversely of the longitudinal axis of the boat and pivotally movable on an approximately vertical axis, a propeller-wheel mounted on said support, and driving connections to said propeller, operative while permitting said adjustments of said propeller-support, substantially as described.

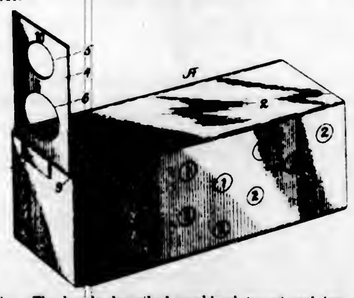
2. The combination with the hull of a boat, of a propeller-support mounted for angular adjustments and for pivotal movements on an approximately vertical axis, a common controller or handpiece for imparting said two movements to said support, a propeller-wheel mounted on said support, and driving connections to said propeller, operative while permitting the said adjustments of said propeller-support, substantially as described.

3. The combination with the hull of a boat, of a propeller-support pivotally connected thereto for pivotal movements in an approximately vertical plane, a power-shaft extending through the pivotal connections between the said hull and the said propeller-support, an approximately vertical shaft journaled in the propeller-support, a sleeve surrounding said vertical shaft and rotatively mounted in the main body portion of said propeller-support and itself constituting a part of said propeller-support, a propeller-wheel carried by the lower end of said sleeve and geared to said vertical shaft, a handpiece or controller pivotally mounted in the upper portion of the body of said propeller-support, a counter-shaft journaled in the body of said propeller-support and provided with a pair of gears, a gear on said sleeve meshing with one of the gears of said counter-shaft, a gear connected for rotation with said handpiece or controller and meshing with the other gear of said counter-shaft, and power-transmitting connections between the said power-shaft and said vertical shaft, operative while permitting the noted adjustments of said propeller-support, substantially as described.

4. The combination with the hull of a boat, of a propeller-support having a rotary sleeve-section, a propeller having its shaft journaled in the lower portion of said sleeve-section, a power-driven shaft journaled in said sleeve-section and connected to the shaft of said propeller by a pair of intermeshing bevel-gears, a handpiece having a stem portion journaled in said propeller-support above said power-driven shaft, a counter-shaft offset from said sleeve-section and the stem of said handpiece, journaled in said propeller-support and connected both to the stem of said handpiece and to said rotary sleeve-section of said propeller-support, substantially as described.

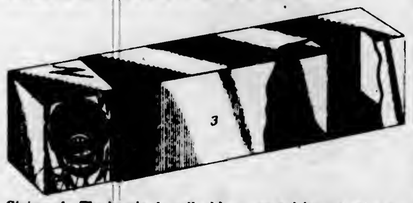
5. The combination with the hull of a boat, of a propeller-support pivotally connected to the stern of said boat for pivotal movements in an approximately vertical plane transversely of the boat, a propeller-wheel carried by said propeller-support and movable into and out of the water by pivotal movements thereof, a drive for said propeller including a shaft extending axially through the pivotal connection between said boat and propeller-support, substantially as described.

812,535. BOX FOR HOLDING TOY GUNS AND SIMILAR TOYS. PETER R. WARREN, Brookline, Mass. Filed Jan. 5, 1905. Serial No. 239,717.



Claim.—The herein-described combined target and box comprising a tubular casing, a body adapted to slide freely within said casing and having each end formed by two parallel walls separated at their upper edges, and a target adapted to be received within the said body when not in use and to have one end inserted between the walls of either end of the box, said target having a tongue formed integral therewith and adapted to project over the outer face of the end of the box between the walls of which it is inserted, substantially as described.

812,536. COMBINED BOX AND TARGET. PETER R. WARREN, Brookline, Mass. Filed Jan. 5, 1905. Serial No. 239,718.

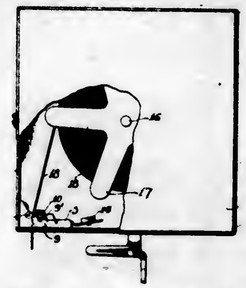


Claim.—1. The herein-described box, comprising an outer casing or shell and a body adapted to slide endwise within said casing, and having one face or side open throughout more or less of its length, an apertured section partly covering said open side of the body and having on its inner surface a flap that projects over the adjacent aperture in said section, substantially as and for the purpose described.

2. The herein-described combined box and target comprising an outer casing or shell and a body adapted to slide endwise within said casing and having one face or side open throughout the greater part of its length, a target-section extending across said open side at one end of the body of the box and having an aperture formed therein, the flap produced by forming said aperture being connected at its upper end to said target-section and extending inwardly within the body of the box, said body and casing being of such proportions that the body is adapted to lie wholly within the casing and have the target-section thereof covered and concealed by the casing.

812,537. FIRE INSULATOR AND EXTINGUISHER. ORVILLE T. WIMER, Philadelphia, Pa., assignor to Sigmund Lubin, Philadelphia, Pa. Filed Apr. 13, 1905. Serial No. 255,183.

Claim.—1. An apparatus of the class described comprising a fireproof casing, housings within said casing, a roller journaled in said housings, a second roller journaled in slots in said housings, and a lever having a movable connection with said second roller whereby the latter may be lifted into engagement with said first roller.



2. An apparatus of the class described comprising a fireproof casing, a reel journaled in said casing, an aperture in said casing, housings in said casing, rollers journaled in said housings, one of said rollers having spindles thereon movable in slotted supports therefor, and a broad lever extending between said housings and having inclined members for holding said rollers together.

3. An apparatus of the class described comprising a tight fireproof casing having a narrow slot therein, a pair of rollers within said casing adjacent to said slot, said slot and rollers being adapted for passing a film, a film-reel supported in said casing, and means coacting with said rollers for preventing the passage of fire to the film between said reel and rollers.

4. An apparatus of the class described comprising a tight fireproof casing having a slot therein, a pair of rollers within said casing adjacent to said slot, said slot and rollers being adapted for the passage of a film, and means coacting with said rollers for preventing the passage of fire beyond said parts into said casing, said means comprising a support having slots in which one of said rollers is adapted to reciprocate from and toward the other.

812,538. WRENCH. IGNATZ WEISNER, Mindenmines, Mo., assignor of one-fourth to Harry Evans, Burdine, Pa. Filed June 19, 1905. Serial No. 265,979.

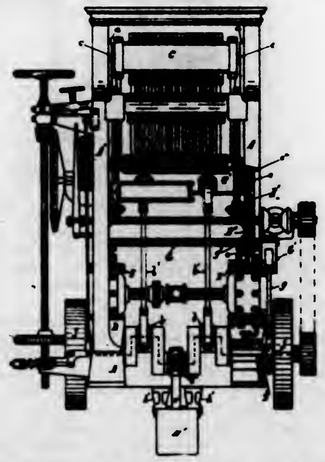
Claim.—1. In a wrench, the combination with a stock having a jaw, of another jaw slidable on the stock, means mounted on the stock for adjusting the jaw, said means including a rack, a yoke slidably surrounding the stock and disposed transversely thereof at one end of the sliding jaw, said yoke also surrounding the rack and having an interlocking engagement therewith at one end, the other end of said yoke having a portion offset at one side of the yoke and overlying the jaw constituting an operating-head, the opposed portions of the head and jaw having seats, a spring interposed between said offset portion or head and the sliding jaw, and engaged in the seats, and inturned guide-flanges carried by the adjacent end of the sliding jaw and embracing the yoke, said yoke sliding between said flanges and the adjacent jaw.

2. In a wrench, the combination with a stock having a jaw at one end and a shank at the other end of less cross-sectional area than the stock, of another jaw slidably mounted upon the stock, a sleeve mounted on the shank and having threads on its interior face, said sleeve having a socket at one end that receives the adjacent end of the stock, a handle-grip mounted on the shank and having one end fitted in the sleeve, said grip and stock holding the sleeve against longitudinal movement on the shank, and the stock preventing the turning movement of said sleeve, an adjusting-nut threaded on the sleeve, and connections between the nut and sliding jaw.

812,539. GANG-SAW MILL. WILLIAM M. WILKIN, Erie, Pa. Filed Oct. 18, 1905. Serial No. 283,330.

Claim.—1. In a gang-saw mill, the combination of a mill-frame,

a saw-sash mounted in the upper part thereof, a crank-shaft mounted in the base of the mill-frame, a sash-operating crank in said shaft, a pitman connecting said crank with the saw-sash, a counterweight-crank in said shaft in opposition to the sash-operating crank and of less throw than the sash-operating crank, a counterweight of greater weight than the parts to be counterbalanced connected to said counterweight-crank, and a link connected to said counterweight and extending laterally therefrom to a bearing on the mill-frame, substantially as described.



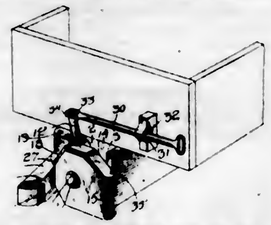
2. The combination in a gang-saw mill of, a mill-frame, a saw-sash mounted in vertical guides in the upper portion of said mill-frame, a crank-shaft mounted in the base of said frame, cranks in said shaft having a throw equal to the traverse of said saw-sash, pitmen connecting said sash and said cranks, counterweight-cranks in said shaft opposite to and having a shorter throw than said sash-cranks, counterweights on said counterweight-cranks steam-cylinders mounted above the bearings of said crank-shaft, pistons in said cylinders, piston-rods connecting said pistons and said saw-sash, valves for operating said pistons, and valve-operating mechanism adapted to operate said valves in unison, substantially as described.

3. The combination in a gang-saw mill of, a mill-frame, a saw-sash mounted on slides in vertical ways in the upper portion of said frame, a crank-shaft mounted in suitable bearings in the base of said mill-frame, one or more cranks therein adapted to be connected to said sash, and one or more opposing cranks, of less throw than the sash-cranks, adapted to operate counterweights, pitmen connecting said sash-cranks to said saw-sash, counterweights of greater weight than the parts to be balanced, rigid arms on said counterweights connecting them with the counterweight-cranks, and pulleys mounted on said crank-shaft, substantially as described.

4. The combination in a gang-saw mill, of a mill-frame, vertical ways in the upper part of said frame, a saw-sash mounted in said vertical ways, a crank-shaft mounted in the base of said frame, one or more cranks in said crank-shaft having a throw equal to the traverse of the saw-sash, and one or more cranks therein opposite to and of less throw than said sash-cranks, counterweights of greater weight than the parts to be counterbalanced secured to said counterweight-cranks by means of rigid arms, links pivoted to said counterweights and to bearings on the mill-frame, steam-cylinders mounted upon supports over the bearings of said crank-shaft, pistons in said cylinders, piston-rods connecting said pistons directly to said saw-sash, valves on said steam-cylinders for operating said pistons, stems connected to said valves, a rock-shaft mounted in said frame, levers on said rock-shaft connected to said valve-stems, a lever on said rock-shaft adapted to rock said shaft, an eccentric mounted on said crank-shaft, a collar embracing said eccentric, and an eccentric-rod connecting said collar and rock-shaft-operating lever, substantially as described.

5. In a gang-saw mill, a mill-frame, a saw-sash mounted in the upper part thereof, a crank-shaft mounted in the base of the mill-frame, sash-operating cranks in said shaft, pitmen connecting said cranks with the saw-sash, a counterweight-crank in said shaft in opposition to the sash-operating cranks, a counterweight, a rigid arm on said counterweight connecting it with the counterweight-crank, and a link pivoted to said counterweight and extending laterally therefrom to a bearing on the mill-frame, substantially as described.

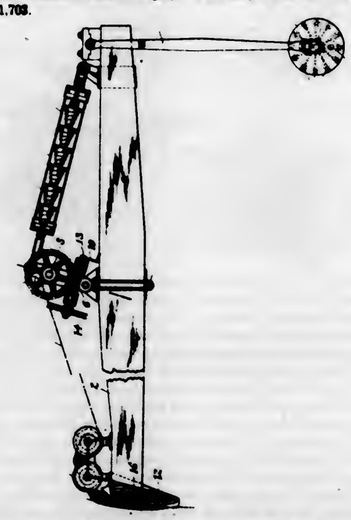
812,540. **AUTOMATIC CAR-COUPLING.** DAVID M. WILSON, near Maynardville, Tenn., assignor to Kosciusko Hamilton, Washington, D. C. Filed Sept. 27, 1904. Serial No. 226,348.



Claim.—1. A car-coupling including draw-timbers, each timber having a groove formed in its inner face for alinement one groove with the other to form a bore, means for securing the draw-timbers together, draw-bars arranged in spaced alinement in said bore, a spring disposed between the inner ends of said draw-bars, a fixed jaw secured to the outer end of one of said draw-bars, a pivoted jaw mounted upon one of said timbers adjacent said fixed jaw, and a lever for operating said jaws.

2. In a car-coupling, a car, draw-timbers secured to the bottom of the car and projecting beyond one end of the car, each timber having a longitudinal groove in its inner face for coöperation one groove with the other to form a bore, draw-bars arranged in spaced alinement in said bore, a spring arranged between the inner ends of the said draw-bars, a fixed jaw mounted upon the outer end of one of said bars, a pivoted jaw mounted adjacent said fixed jaw, and means passed through the projecting end of said timbers for operating said jaws.

812,541. **DEEP-BORING APPARATUS.** WLADYSLAW WLODARCZYK, Borislaw, Austria-Hungary. Filed May 23, 1905. Serial No. 261,703.



Claim.—1. A deep-boring apparatus comprising a rocking beam, a boring-tool chain, a pivoted chain-guide lever and a spring attached to the free end of the pivoted lever, substantially as described.

2. A deep-boring apparatus comprising a rocking beam, a boring-tool chain, a pivoted chain-guide lever, and a spring controlling the lever and mounted on the beam, substantially as described.

3. A deep-boring apparatus comprising a rocking beam, a boring-tool chain, a pivoted chain-guide lever mounted on the beam, and a spring controlling the lever and mounted on the beam, substantially as described.

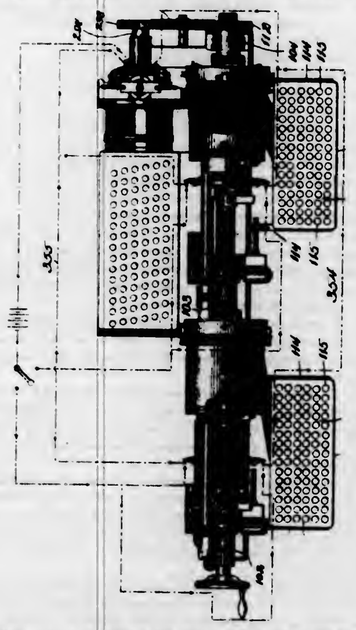
4. A deep-boring apparatus comprising a rocking beam, a chain, a pivoted chain-guide lever, a spring controlling said lever and mounted on the beam and a chain-winch, substantially as described.

5. A deep-boring apparatus comprising a rocking beam, a chain, a winch and a chain-guiding head on the beam, said head having means for guiding the chain through itself in a sinuous path, substantially as described.

6. A deep-boring apparatus comprising a rocking beam, a chain, a chain-guide lever mounted on the beam, elastic means connecting the lever and the beam and a chain-winch mounted on the lever, substantially as described.

7. A deep-boring apparatus comprising a rocking beam, a chain, a pivoted chain-guide lever, a spring controlling said lever, and a chain-winch mounted on the lever, substantially as described.

812,542. **ATTACHMENT FOR KEYBOARD-MACHINES.** EMIL V. BEALS, Boston, Mass. Filed Sept. 25, 1901. Serial No. 76,507.



Claim.—1. A machine of the character described comprising a plurality of key-actuated composing mechanisms, and mechanism adapted to coact with any one of said composing mechanisms to operate the keys of a keyboard.

2. A machine of the character described, comprising key-actuating mechanism, a plurality of sets of actuators, selecting mechanism for each set of actuators, and means whereby each set of actuators when selected causes the actuation of said key-actuating mechanism.

3. In combination, a machine having a keyboard and a machine of the character described comprising a composing mechanism for composing a line of matter by successive selections, and mechanisms for actuating the keys of said keyboard-machine to reproduce said line of matter after said line has been completed.

4. A machine of the character described comprising mechanism for selecting a line of actuators successively, and side by side and mechanism controlled by said actuators when the line thereof is complete for actuating the keyboard of a finger-key-actuated machine.

5. A machine of the character described comprising a keyboard, a plurality of actuators successively selected by the keys on said board, means for arranging said actuators side by side and mechanism coacting with said actuators after the selection of a line is completed for operating the keys of a finger-key-actuated machine.

6. A machine of the character described comprising mechanism for actuating the keys of a keyboard, manually-selected actuators for controlling said actuating mechanism, to cause the actuation of said keys in the order of the selection of the actuators, and provisions whereby a line or group of successively-selected actuators arranged side by side is complete before the key-actuating mechanism is operated.

7. A machine of the character described comprising mechanism for actuating the keys of a keyboard, a plurality of actuators for controlling said mechanism, and means including a plurality of keys and mechanism controlled thereby for selecting and positioning said actuators side by side in a line to represent a line of printed matter.

8. A machine of the character described comprising mechanism for actuating the keys of a keyboard, and a plurality of sets of actuators, each set having an independent control over said mechanism.

9. A machine of the character described comprising mechanism for actuating the keys of a keyboard, and a plurality of independent composing mechanisms for independently coacting with said actuating mechanism to cause the actuation of said keys in predetermined order.

10. A machine of the character described comprising a plurality of composing mechanisms, each including a plurality of manually-selected actuators, and a duplicating or key-actuating mechanism adapted to coact singly with the actuators of each composing mechanism.

11. A machine of the character described comprising a plurality of independent key-actuated selectors, a series of actuators adapted to be selected by each of the selectors, and a key-actuating mechanism adapted to coact with each series of actuators independently.

12. A machine of the character described comprising a mechanical line composed of a plurality of successively-selected actuators arrangeable into side-by-side alinement in predetermined relation, and key-actuating mechanism controlled by said actuators.

13. A machine of the character described comprising a composing mechanism including a plurality of keys, and a mechanical line of actuators arrangeable successively into a line and side by side according to the order of selection of said keys, and a key-actuating mechanism controlled by said line of actuators.

14. A machine of the character described comprising a composing mechanism including a plurality of keys, and a line of actuators each of which is under the domination of all of said keys, and key-actuating mechanism whereby said actuators may select the keys of a keyboard according to their own selection and arrangement.

15. A machine of the character described comprising a composing mechanism including a plurality of keys, and a line of rotary actuators successively positioned in order to represent a line of printed matter by said keys and key-actuating mechanism by which the keys of a keyboard may be subsequently selected according to the order of selection of said actuators.

16. A machine of the character described comprising a plurality of keys, a series of rotary actuators which are adapted to be successively positioned in order in predetermined relation to a fixed line by any one of said keys, and mechanism whereby said actuators cause the actuation of other keys in a keyboard.

17. A machine of the character described comprising a line of actuators normally free to rotate on a common axis, selecting mechanism for positioning said actuators in succession; whereby when said actuators are positioned they constitute a dummy line of matter and key-actuating mechanism controlled by said line.

18. A machine of the character described comprising a mechanical line of actuators successively prearrangeable side by side according to the will of the operator to indicate or represent a line of printed matter, and automatic mechanism whereby said actuators cause the actuation of those keys of a keyboard which correspond to the characters in said line of printed matter.

19. A machine of the character described comprising a mechanical line of actuators, an electromagnetic selector for said actuators, keys and key-circuits for effecting the actuation of said selector, and means for holding said actuators in their selected positions until the selection of any predetermined number thereof is complete.

20. A machine of the character described, comprising a series of rotatable actuators, stops arranged about the axis of said actuators so as to stop said actuators at any predetermined position, a series of keys, and a selector controlled by said keys to operate any one of the stops.

21. A machine of the character described comprising a series of rotatable actuators, stops arranged to arrest said actuators at any desired position, a selector to actuate said stops and electromagnetic mechanism for controlling said selector.

23. A machine of the character described comprising a series of rality of dummies whose parts are prearrangeable, and a plurality of

52. A machine of the character described comprising a cylin- ical selector movable in a cycle into potential coacting relation with

22. A machine of the character described comprising a series of actuators in circular form, a series of stops arranged in a circle, and a key-governed selector rotatable in proximity to said stops and adapted to operate them in any predetermined order.

23. A machine of the character described comprising a series of actuators, a series of setting-stops having their ends arranged in a circle, a rotatable carrier in proximity to said stop ends, and a key-controlled selector on said carrier for said stops.

24. A machine of the character described, comprising a plurality of independent composing mechanisms each including a dummy line adapted to be set up according to the will of the operator, a single key-actuating mechanism adapted to coact with said dummy lines, and means whereby said dummy lines can be placed in operative relation to said key-actuating mechanism only one at a time.

25. A machine of the character described, comprising a single key-actuating mechanism, a plurality of composing mechanisms, and intervening mechanisms adapted to coact with said composing mechanism for effecting the actuation of the key-actuating mechanism.

26. A machine of the character described, comprising a plurality of series of actuators adapted to be set in any predetermined relation, and a key-actuating mechanism adapted to coact with and be controlled by each of said series of actuators.

27. A machine of the character described, comprising a plurality of keys adapted to be selected and actuated in succession, by an operator, a series of actuators adapted to be selected and set in succession by said keys until a line is formed, and key-actuating mechanism controlled by said actuators in succession to depress a series of keys, whereby the last-mentioned keys are automatically actuated in the same order that the first-mentioned keys were actuated.

28. An attachment for a linotype, type-setting, matrix-making or analogous keyboard-machine, having mechanism including a plurality of separate sets of actuators and separate keyboards whereby a series of operators may independently and simultaneously set up dummy lines of matter, and one at a time cause the actuation of the keys of said machine, thereby permitting several operators to be working at a single keyboard-machine.

29. A machine of the character described, comprising an electromagnetic key-actuating mechanism, in combination with a selective line of actuators, and electrical transferring mechanism coacting with said actuators and said key-actuating mechanism.

30. A machine of the character described, comprising an electromagnetic composing mechanism, including a keyboard, and electromagnetic selectors controlled thereby an electromagnetic key-actuating mechanism and electrical connections between said mechanisms.

31. A machine of the character described, comprising a composing mechanism including a selective line of actuators arranged side by side, means for successively selecting said actuators to represent a line of printed matter, and a key-duplicating mechanism including a plurality of key-operating members whose selection and operation is controlled by the said actuators.

32. A machine of the character described, comprising a composing mechanism including a selective line of actuators adapted to be arranged side by side, means for successively selecting said actuators to represent a line of printed matter, and a mechanism including a plurality of key-operating members, and a selector for selecting and operating said members controlled by the actuators.

33. A machine of the character described comprising a composing mechanism including a plurality of actuators, each having an operative member, and means for successively selecting and controlling the positions of the members in a line to represent a line of printed matter whereby each actuator represents one character according to its position, and a mechanism including a plurality of key-operating members, and intervening mechanism controlled by the operative members of said actuators for operating said last-mentioned key-actuating members.

34. A machine of the character described comprising a composing mechanism including a line of actuators and selecting means therefor, and a key-actuating mechanism including a plurality of key-operating members, a carriage movable along the line of actuators and provisions of which a part is on said carriage, for actuating said members.

35. A machine of the character described comprising a dummy having stops as described, key-actuating members, and mechanism coacting with said stops successively to actuate said members.

36. A machine of the character described comprising a dummy having stops, as described, and selecting mechanism for positioning said stops, key-actuating members, and electromagnetic selecting mechanism for said members controlled by said dummy.

37. A machine of the character described comprising a plurality of dummies whose parts are prearrangeable, and a plurality of selecting mechanisms for said dummies, in combination with a set of key-actuating members controlled by each of said dummies.

38. A machine of the character described comprising a plurality of dummies whose parts are prearrangeable, and an independent selecting mechanism for each dummy, in combination with a series of key-actuating members, and electromagnetic mechanism controlled by each dummy for actuating said members.

39. A machine of the character described comprising a plurality of selectors, a dummy whose parts are prearrangeable, a set of key-actuating members, a set of keys corresponding to said member, and provisions whereby one of the selectors controls the parts of the dummy and the other selector is controlled by the dummy to actuate the said members, said instrumentalities being arranged and related whereby the actuation of the keys in a predetermined order effects, through the said instrumentalities, the actuation of said members in the same order.

40. A machine of the character described comprising a plurality of prearrangeable parts or members and selecting mechanism therefor including a plurality of keys, a series of electric circuits one for each key, and an electromagnetic selector governed by each circuit.

41. A machine of the character described comprising a plurality of circuits, a stationary commutator whose sections are respectively arranged in said circuits, and a rotary electromagnetic clutch having a brush which contacts with said sections respectively.

42. A machine of the character described comprising a dummy consisting of a plurality of rotary members, each having a stop; a series of stop members equal in number to said keys and arranged to engage the stops on the rotary members successively, a stationary commutator whose sections are arranged in said circuits respectively, and a rotary magnetic clutch having provisions whereby a change in any one of said circuits causes said clutch to operate a corresponding stop member and position a rotary member of the dummy.

43. A machine of the character described comprising a plurality of rotary members each having an external stop, and a series of internal notches, a stationary support provided with a spline, and means for stopping said members one by one in predetermined positions and feeding them on said spline whereby they are subsequently held against rotary motion relatively thereto.

44. A machine of the character described comprising a plurality of rotary members, a plurality of selector-slides, means for actuating said slides in any predetermined order, and means for resetting said slides.

45. A machine of the character described comprising a plurality of rotary members, means for feeding said members axially with a step-by-step movement, devices for stopping said members against rotation one by one, and selector mechanism controlling said stopping devices and said feeding means.

46. A machine of the character described comprising a plurality of rotary members, means for feeding said members axially with a step-by-step movement, devices for stopping said members against rotation one by one, selector mechanism controlling said stopping devices and said feeding means, and means for returning said members to initial position.

47. A machine of the character described comprising a plurality of rotary members, devices for stopping said members one by one against rotation, means for feeding said members in one direction including a pawl and ratchet-bar, and a screw-driven carriage for feeding said members in the opposite direction.

48. A machine of the character described comprising two synchronously-moving selectors, a series of keys controlling the operation of one selector, a series of key-actuating members for operating on the keys of a keyboard and under the control of the other selector, and operative mechanism between said selectors, said instrumentalities being arranged and combined whereby the actuation of the keys effects the operation of the key-actuating members.

49. A machine of the character described comprising a line of prearrangeable actuators, a series of key-operating members, and intervening mechanism including an operative part movable longitudinally of said line of actuators.

50. A machine of the character described having a carriage, a nut on said carriage, a rotary screw-bar, and means for longitudinally reciprocating said bar, with the effect that the carriage receives an intermittent step-by-step movement.

51. A machine of the character described comprising a carriage having a nut, a rotary screw-bar engaged with said nut, a stationary cam, a coacting cam on the screw-bar, and means for rotating said screw-bar with the effect that the coaction of the cams and the rotation of the screw-bar cause the carriage to be actuated with a step-by-step movement.

52. A machine of the character described comprising a cylindrical support, a plurality of rotary members adapted to be set in order on said support, and means for rotating said support when said members are set thereon.

53. A series of elements to be actuated selectively, a selector movable in a cycle into potential coacting relation with each of said elements in succession, and electromagnetic means to cause the coaction of said selector with any of said elements when in such coacting relation.

54. A series of movable elements to be actuated selectively, a selector adapted to mechanically move said elements and movable in a cycle into potential coacting relation with each of said elements in succession, and electromagnetic means to cause the coaction of said selector with any of said elements when in such coacting relation.

55. A series of movable elements, a selector moving in potential coacting relation with said elements for effecting the actuation of said elements in any predetermined order, and electromagnetic means to cause the coaction of said selector with any of said members.

56. A series of members, a selector movable into coacting relation with each of said members in succession, and electromagnetic mechanism including a clutch adapted to produce the coacting relation of said selector with any of said members.

57. A circularly-disposed series of members to be actuated selectively, a selector mounted to revolve into potential coacting relation with each of said elements in succession, and means to cause the coaction of said selector with any of said elements when in such coacting relation.

58. A circularly-disposed series of selective elements, a selector revoluble into potential coacting relation with said elements in succession, an electromagnetic clutch revoluble with said selector to cause the actuation thereof and the consequent operation of an element, an electric circuit for said clutch, and a circuit-controller.

59. A circularly-disposed series of selective elements, a selector revoluble into potential coacting relation with said elements successively and also rotatable into coaction with said elements, and means for causing the rotation of said selector into such coaction with any of said elements.

60. A circularly-disposed series of selective elements, a selector revoluble into potential coacting relation with said elements successively and also rotatable into coaction with said elements, a rotatable revoluble clutch normally disconnected from said selector, and means whereby said clutch causes the rotation of said selector into coaction with any of said elements.

61. A circularly-disposed series of selective elements, a concentric gear, a pinion mounted to revolve and rotate in mesh with said gear, a selector mounted to revolve with said pinion into potential coacting relation with each of said elements, and means for clutching said selector with said pinion to cause said selector to rotate with said pinion and actuate an element.

62. A circularly-disposed series of selective elements, a concentric gear, a pinion mounted to revolve and rotate in mesh with said gear, a selector mounted to revolve with said pinion into potential coacting relation with each of said elements, and electromagnetic mechanism including an electromagnetic clutch for clutching said selector to said pinion at will.

63. A series of selective elements, a selector movable in a cycle into potential coacting relation with said elements in succession, a series of controlled electric circuits for effecting the coaction of the selector, with any of said elements, a circuit-controller synchronized with said selector for rendering each of said circuits in succession, and means for operating said circuits.

64. A series of selective elements, a selector movable in a cycle into potential coacting relation with said elements in succession, a series of controlled electric circuits for effecting the coaction of the selector, with any of said elements, means for operating the circuits, and a controller comprising a fixed commutator whose segments are included in the respective circuits, and revolving brush synchronized with the selector and adapted to render each of said circuits operative in succession.

65. A series of selective elements, a selector movable in a cycle into potential coacting relation with said elements in succession, a series of controlled electric circuits for effecting the coaction of the selector, with any of said elements, means for operating the circuits, and a controller comprising a fixed commutator whose segments are included in the respective circuits, a revolving brush for rendering said circuits successively operative, and gearing for effecting a synchronous revolution of the selector and the brush.

66. A series of elements to be actuated selectively, a mechanical selector movable in a cycle into potential coacting relation with said elements in succession, electromagnetic means to produce the coaction of said selector with any of the elements, a series of circuits for operating said means, and a controller for said circuits synchronized with the selector by a positive mechanical connection.

67. A circularly-disposed series of elements to be actuated selectively, a selector mounted to revolve concentrically therewith and to rotate into coaction with any of said elements, clutch parts adapted to have a frictional engagement and a relative sliding movement when frictionally engaged, one of said parts being continuously rotated, and the other connected to the selector, means to connect and disconnect said clutch parts, and an automatic stop acting to position the selector while the clutch parts are engaged.

68. A circularly-disposed series of elements to be actuated selectively, a concentric gear, a pinion to revolve and rotate in mesh with said gear and having a clutch part, a selector mounted to revolve with said pinion into potential coacting relation with each of said elements in succession, and having a complemental clutch part, the said clutch parts when connected causing the selector to reproduce the rotary movement of the pinion, whereby the said elements are actuated, and means to connect and disconnect the clutch parts.

69. A circularly-disposed series of elements to be actuated selectively, a concentric gear, a pinion mounted to revolve and rotate in mesh with said gear and having a clutch part, a selector mounted to revolve with said pinion into potential coacting relation with each of said elements in succession, and having a complemental clutch part, the said clutch parts when connected causing the selector to reproduce the rotary movement of the pinion, whereby the said elements are actuated, means to normally disconnect the clutch parts, and an electromagnet mounted to revolve with the selector and pinion and adapted to connect the clutch parts.

70. A machine of the character referred to, comprising a mechanical line whose parts are selectively prearrangeable side by side, selecting mechanism for said line, a register controlled by said selecting mechanism for denoting aggregate thicknesses of the characters represented by the parts in said line, and means for effecting a variable movement of said register.

71. A machine of the character referred to, comprising a mechanical line of selective rotary members, and an indicator for automatically indicating the presence of said members as they are added to the line.

72. A machine of the character referred to comprising a mechanical line of selective members representing the characters in a font of type, means for selecting and placing said members side by side in a line, and an indicator mechanism controlled by said selector and including a scale and means for indicating on said scale the width of each character as the member corresponding thereto is added to the line.

73. A machine of the character referred to comprising a mechanical line of selective members representing the characters in a font of type, means for selecting and placing said members in a line, an indicator, and a plurality of devices controlled by said selecting means and each adapted to operate said indicator.

74. A machine of the character referred to comprising a mechanical line of selective members representing the characters in a font of type, means for selecting and placing said members in a line, an indicator, a plurality of devices corresponding to the characters of different widths, and means for actuating said devices and thereby operating said indicator, as the said members are selected and added to the line.

75. A machine of the character referred to comprising a mechanical line of selective members representing the characters in a font of type, means for selecting said members, means for placing said members side by side in a line, and a line-indicator controlled by said selecting means and operated by said placing means.

76. A machine of the character referred to comprising a mechanical line of selective members representing the characters in a font of type, means for selecting and placing said members in a line, an indicator, a plurality of independent cam-couplers for operating said indicator, and means for actuating said cam-couplers as said members are added to the line.

77. A machine of the character described comprising a mechanical line of selective elements adapted to be placed one by one into set position side by side in a single row, selector mechanism for said elements, and an escapement mechanism for said elements controlled by said selector mechanism.

78. A machine of the character described comprising a mechanical line of selective rotary elements, selector mechanism and an electromagnetic mechanism for feeding said element into set position.

79. A machine of the character described comprising a mechanical line of selective elements, selector mechanism and an escapement mechanism for locating said elements in the selected positions.

80. A machine of the character described comprising a mechanical line of rotary selective elements, selector mechanism for selecting the positions of said elements, and escapement mechanism including an electromagnetically-controlled clutch.

81. A machine of the character described comprising a support, a series of selective elements on said support, a selector mechanism for said elements, including a rotary member, an operating member, and means for permitting said operating member to rotate with said rotary member upon the operation of the selector mechanism.

82. A machine of the character described comprising a support, a series of selective elements on said support, a selector mechanism for said elements, and an escapement mechanism for feeding said elements, including a cam, a wheel frictionally clutched thereto, and an electromagnetic stop for said cam controlled by the selector mechanism.

83. A machine of the character described comprising a series of rotary selective elements, electromagnetic selector mechanism for selecting the position of each element, and mechanism for feeding said elements when selected, including an escapement, an electromagnetic stop under control of the selector mechanism for controlling said escapement, and means whereby said escapement mechanism is operated after the element is selected.

84. A machine of the character described comprising a cam, a rotary member clutched thereto, and an electromagnetic stop for said cam, said stop including a compound electromagnet having its armatures operatively connected together.

85. A machine of the character described having an escapement including an electromagnetic stop consisting of oppositely-arranged magnets of different strengths, armatures connected together to be attracted in opposite directions, means for temporarily closing the circuit through the stronger magnet, and means for mechanically moving the armature of said weaker magnet to operative position.

86. A machine of the character described comprising a series of rotary selective elements, adapted to be set in a line, an escapement therefor including a rotary member, an electromagnetic stop, and a plurality of key-controlled circuits each of which controls said electromagnetic stop.

87. A plurality of rotary members prearrangeable selectively, a cylindrical support on which said members are rotatively mounted, and an inner cylinder on which said support is longitudinally movable, said inner cylinder having means for holding said members against independent rotation.

88. A plurality of rotary members prearrangeable selectively, a cylindrical support on which said members are free to rotate, an inner cylinder on which said support is longitudinally movable, said cylinder having means for holding said members against independent rotation, means for feeding said support, and means for rotating said cylinder and support.

89. A plurality of rotary members prearrangeable selectively, a cylindrical support on which said members are free to rotate, an inner cylinder on which said support is longitudinally movable, said cylinder having means for holding said members against independent rotation, a rotary shift on which said cylinder is mounted, and a clutch between said shift and said cylinder.

90. A plurality of selectively prearrangeable rotary members, each having a stop, a series of slides arranged in a cycle, a selector movable in potential coacting relation with said slides in succession, and means for effecting the coaction of said selector with any one of slides to cause it to engage the stop of a rotary member to position the latter.

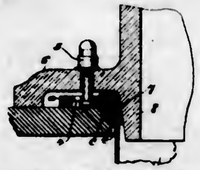
91. A plurality of selectively prearrangeable rotary members, each having a stop, a series of slides arranged in a cycle, a selector movable in potential coacting relation with said slides in succession, means for effecting the coaction of said selector with any one of slides to cause it to engage the stop of a rotary member to position the latter, and means for resetting said slides.

92. The combination with a support, of a selector-slide having a shoulder resting on one wall of said support, and a spring bearing against another wall of said support, whereby a longitudinal movement of said slide disengages said shoulder and permits the spring to act.

93. A selective element adapted to form a part of a variable mechanical line and consisting of a ring having a disappearing or movable stop.

94. A selective element adapted to form a part of a variable mechanical line and consisting of a ring having a spring-pressed stop which may be depressed substantially flush with the periphery of said ring.

812,543. **FLOOR-FLANGE FOR WATER-CLOSET BOWLS.** ARCHIBALD BUCHANAN, Jr., New York, N. Y. Filed Apr. 19, 1905. Serial No. 256,376.



Claim.—1. A water-closet floor-flange having a dishing collar, the lower portion of whose inner surface is offset or depressed and into which the upper end of the soil-pipe is to be received and bent over and then secured by solder.

2. A floor-flange for soil-pipe connections for water-closet bowls, having a central depending collar provided at its inner lower edge with a cut-away portion.

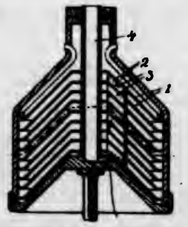
3. A floor-flange for soil-pipe connections for water-closet bowls having a central integral depending collar whose inner surface is concave and provided at its inner lower edge with a cut-away portion.

4. A floor-flange for soil-pipe connections for water-closet bowls provided with series of slots for connections respectively to the slab and closet-bowl and having a central integral depending collar whose inner surface is concave and provided at its inner lower edge with a peripheral cut-away portion.

5. A floor-flange for soil-pipe connections for water-closet bowls, having a central integral depending collar whose inner surface is concave and provided at its inner lower edge with a peripheral cut-away portion adapted to receive the upper end of the soil-pipe in such a manner that the gasket employed to form the joint between the floor-flange and the closet-flanges will completely cover the joint between the floor-flange and the soil-pipe and extend between the same and the said closet-flanges.

6. A water-closet floor-flange having a central dishing collar, the inner surface of which inclines downward and upon the lower portion of which surface the outwardly-bent-over upper end of the soil-pipe is received and secured by solder which also overlies sufficient of the surface of the collar and pipe as to make a continuous surface upon which surface and over which union the gasket extends.

812,544. **CENTRIFUGAL LIQUID-SEPARATOR.** ALGOT L. CHRISTENSON, Stockholm, Sweden. Filed Nov. 3, 1904. Serial No. 231,306.



Claim.—1. The combination with a centrifugal separating-bowl and a liner therein consisting of conical plates superposed on one another, of walls extending axially through the bowl and being placed obliquely in relation to a radius, and means for introducing the full-milk in front of the said walls in relation to the direction of rotation of the bowl, substantially as and for the purpose set forth.

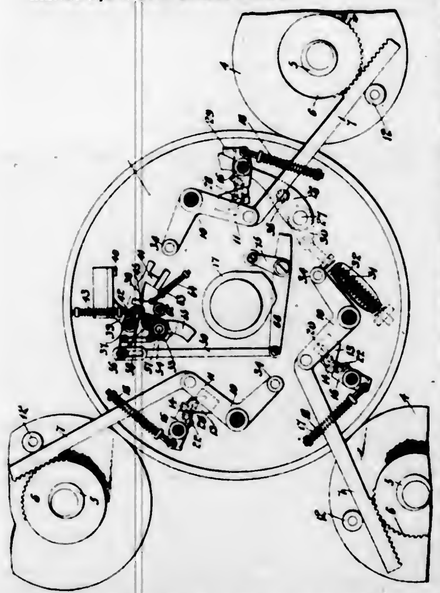
2. The combination with a centrifugal separating-bowl and a liner therein consisting of conical plates superposed on one another, of imperforate walls extending axially through the bowl and intersecting the liner at the inner part of the same and being placed obliquely in relation to a radius, and means for introducing the full-milk in front of the said walls in relation to the direction of rotation of the bowl, substantially as and for the purpose set forth.

3. The combination with a centrifugal separating-bowl and a liner therein consisting of conical plates superposed on one another the said plates having notches at their inner parts forming axially-running distributing-channels, of imperforate walls limiting the rear sides of the said channels in relation to the direction of rotation of the bowl, the said walls being placed obliquely in relation to a radius, and means for introducing the full-milk in front of the said walls in relation to the direction of rotation of the bowl, substantially as and for the purpose set forth.

4. The combination with a centrifugal separating-bowl and a liner therein consisting of conical plates superposed on one another, the said plates having notches at their inner parts forming together axially-running distributing-channels, of imperforate ribs on said plates placed at the rear sides of said notches in relation to the direction of rotation of the bowl and in alinement with each other so as to form together with the intermediate edges of the plates walls extending axially through the bowl, and means for introducing the full-milk in front of the said walls in relation to the direction of rotation of the bowl, substantially as and for the purpose set forth.

5. The combination with a centrifugal separating-bowl and a liner therein consisting of conical plates superposed on one another, of a central inlet-pipe having longitudinal wings, imperforate walls intersecting the liner at the inner part of the same and extending outward from the outer edges of the said wings obliquely to a radius, and means for introducing the full-milk in front of the said walls in relation to the direction of rotation of the bowl, substantially as and for the purpose set forth.

812,545. **PRINTING-PRESS.** THOMAS G. CLARIDGE and THOMAS A. RANDALL, Plainfield, N. J., assignors to Aluminum Press Company, New York, N. Y., a Corporation of New York. Filed June 25, 1903. Renewed Sept. 6, 1905. Serial No. 277,257.



Claim.—1. In a printing-press, the combination of the form and impression cylinders, and means for relatively shifting said cylinders into and out of printing position, with a shiftable revolving cam member adapted to actuate said cylinder-shifting means, and a device interposed in the path of said cam member adapted to shift it toward and away from its axis of revolution, substantially as and for the purpose set forth.

2. In a printing-press, the combination of the form and impression cylinders, and means for shifting one of said cylinders toward and away from the other, with a shiftable cam member mounted upon and revolving with one of said cylinders and adapted to actuate said cylinder-shifting means, and a shiftable device interposed in the path of the cam member and adapted to shift it toward and away from its axis of revolution, substantially as and for the purpose set forth.

3. In a printing-press, the combination of the form and impression cylinders, and means for shifting one of said cylinders toward and away from the other, with a cam member mounted upon one of said cylinders and adapted to be shifted toward and away from its axis of revolution, manually-controlled means interposed in the path of the cam member for shifting its position, and means for retaining the cam member in either shifted position, substantially as set forth.

4. In a printing-press, the combination of the form and impression cylinders, and means for shifting one of said cylinders toward and away from the other, with a cam member mounted upon one of said cylinders and adapted to be shifted toward and away from its axis of revolution, manually-controlled means interposed in the path of the cam member for shifting its position, and means for retaining the cam member in either shifted position, substantially as set forth.

5. In a printing-press, the combination of the form and impression cylinders, and means for shifting one of said cylinders toward and away from the other, with a shiftable cam member mounted upon and revolving with one of said cylinders and adapted to actuate said cylinder-shifting means, a shiftable device interposed in the path of said cam member and adapted to shift it toward and away from its axis of revolution, means for retaining said device in either of its shifted positions, and manually-operated means for shifting said device, substantially as set forth.

6. In a printing-press, the combination of the form and impression cylinders, and means for shifting one of said cylinders toward and away from the other, with a shiftable cam member mounted upon and revolving with one of said cylinders and adapted to actuate said cylinder-shifting means, means for retaining the cam member in either of its shifted positions, a shiftable device interposed in the path of said cam member and adapted to shift it toward and away from its axis of revolution, means for retaining said device in either of its shifted positions, and manually-operated means for shifting said device, substantially as set forth.

7. In a printing-press, the combination of the form and impression cylinders, a revolving cam member, mechanisms operatively controlled by the cam member to move the form-cylinders into and out of printing position, means for changing the operative position of the cam member with relation to the form-cylinder-moving mechanisms, and automatic means for locking the form-cylinder-moving mechanisms when the form-cylinders are moved into printing position.

8. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, means for locking said mechanisms when the form-cylinders are in the printing position, and operating means carried by the impression-cylinder adapted to first release the said locking means and then actuate the form-cylinder-moving mechanisms, as set forth.

9. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, automatic hooks for locking said mechanisms when the form-cylinders are in their printing position, and means carried by the impression-cylinder for releasing said hooks and operating the means for moving the form-cylinders, substantially as set forth.

10. In a printing-press, the combination of the form and impression cylinders, devices for moving said form-cylinders into and out of printing position, spring-actuated means for locking said devices when the form-cylinders are in printing position, a cam member on the impression-cylinder adapted to release said locking means, and a governing device interposed in the path of the cam member to shift said cam member to operatively control the form-cylinder-moving devices and the means for locking said devices.

11. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, a cam member on the impression-cylinder, a governing-shoe interposed in the path of the cam member, means for shifting said governing-shoe to control the operative relation of the cam member with the cylinder-moving means, and means for rendering inoperative the means controlling the governing-shoe when the cam member closely approaches the governing-shoe.

12. In a printing-press, the combination of the impression-cylinder, a cam member carried thereon, a device interposed in the path of said cam for shifting said cam member toward and away from its axis of revolution, means controlling the said device, and means for momentarily rendering inoperative the means for controlling said device, when the cam member on the cylinder closely approaches said device.

13. In a printing-press, the combination of an impression-cylinder and a plurality of form-cylinders, means operatively engaging

said form-cylinders to move them into and out of printing position, a cam member on the impression-cylinder, a governing device adapted to shift the operative position of said cam member, and oscillating devices connected to the means for moving the form-cylinders said oscillating devices being controlled by the cam member.

14. In a printing-press, the combination of the form and impression cylinders, two independent throw-out mechanisms operating upon the opposite ends of one of said cylinders, controlling cam members at each end of said cylinder operatively connected, and means for operatively controlling said cam members to operate the throw-out mechanisms.

15. In a printing-press, the combination of an impression-cylinder, a plurality of form-cylinders, independent throw-out mechanisms for said form-cylinders, a common controlling-cam effecting the operation of said throw-out mechanisms, and a governing device adapted to change the operative position of said cam with relation to the throw-out mechanisms as set forth.

16. In a printing-press, the combination of the form and impression cylinders, independent throw-out mechanisms operating at opposite ends of the impression-cylinder, and a common controlling mechanism adapted to operate the independent throw-out mechanisms and cause them to be simultaneously operated at both ends of the impression-cylinder as set forth.

17. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, actuating-levers included in said cylinder-moving means, a shiftable cam member mounted upon and rotating with the impression-cylinder and formed with inner and outer working cam-faces which are adapted to engage and operate said levers, one of said cam-faces being active in each of the shifted positions of the cam member, and means for shifting said cam member toward and away from its axis of revolution, substantially as set forth.

18. In a printing-press, the combination of the form and impression cylinder, cylinder-moving mechanisms operating upon the form-cylinders and including pivotally-mounted actuating-levers, automatic hooks adapted to engage said levers for locking them against movement when the form-cylinders are in printing position, and a shiftable cam member provided with a part which is adapted to disengage said hooks from said levers and with cam-faces which are adapted to engage and actuate said levers after they are released from said hooks, substantially as set forth.

19. In a printing-press, the combination of the form and impression cylinders, means for moving the form-cylinders into and out of printing position, actuating-levers included in said cylinder-moving means, automatic hooks adapted to engage said levers, and lock them against movement when the cylinders are in printing position, a spring-sustained tripper on each of said locking-hooks arranged to move the hook when pressure is applied to it in one direction and to yield without affecting the hook when pressure is applied to it in the opposite direction, and a shiftable cam member mounted upon and revolving with the impression-cylinder and adapted to operate upon said hook-trippers and upon said levers of the cylinder-moving means, substantially as set forth.

20. In a printing-press, the combination of the form and impression cylinders, means for moving the form-cylinders into and out of printing position, actuating-levers included in said cylinder-moving means, spring-actuated hooks, shoulders upon said levers engaged by said hooks, a tripper pivotally mounted on each of said hooks, a stop-lug upon each hook supporting the tripper against movement in the one direction, a spring acting upon said tripper to hold it in engagement with said stop-lug, and a revolving cam member operating upon said tripper and upon said lever, substantially as set forth.

21. In a printing-press, the combination of the form and impression cylinders, means for moving the form-cylinders into and out of printing-position, and a shiftable cam member adapted to actuate said cylinder-moving means, with a shiftable governing-shoe mounted in the path of the cam member and formed with two cam-surfaces, one of which is adapted to engage a part of the cam member for actuating it in each of the shifted positions of the governing-shoe, and means for shifting the position of said shoe, substantially as set forth.

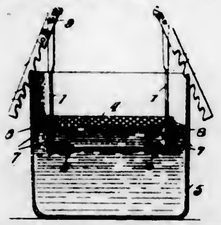
22. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, a movable cam member adapted to actuate said cylinder-moving means, with a shiftable governing-shoe supported in the path of the cam member and adapted to shift its position, and manually-operated controlling means so constructed and arranged that its successive operating strokes will move the governing-shoe alternately into its different shifted positions, substantially as set forth.

23. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, a movable cam member adapted to actuate said cylinder-moving means, with a shiftable governing-shoe supported in the path of the cam member and adapted to shift its position, a spring tending to throw said governing-shoe into one position, a latch adapted to retain said governing-shoe in its opposite shifted position against the tendency of said spring, and manually-operated controlling means suitably connected with said shoe and said latch, substantially as set forth.

24. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, a movable cam member adapted to actuate said cylinder-moving means, with a shiftable governing-shoe supported in the path of the cam member and adapted to shift its position, a spring tending to hold said shoe in one position, manually-operated controlling means adapted to move the shoe into its opposite position, a latch adapted to retain the shoe in said opposite position, a controlling-cam provided with a ratchet-wheel, a part on said latch engaging said cam, and an oscillating pawl engaging said ratchet-wheel and suitably connected with the manually-operated controlling means, substantially as set forth.

25. In a printing-press, the combination of the form and impression cylinders, means for moving said form-cylinders into and out of printing position, a movable cam member adapted to actuate said cylinder-moving means, with a shiftable governing-shoe supported in the path of the cam member and adapted to shift its position, manually-operated controlling means suitably connected with said controlling-shoe for shifting its position, and a cam rotating with the impression-cylinder and adapted to engage a part upon the manually-operated controlling means to prevent the operation of the controlling means during a certain period of the operation of the machine, substantially as and for the purpose set forth.

812,546. POT-RACK. ELLIS B. CLOSINGER. Hughes Springs, Tex. Filed May 20, 1905. Serial No. 261,366.



Claim.—1. In a supporting device of the class described, the combination of a supporting-arm adapted to be attached to a crate or like, a bar pivoted between its ends to said supporting-arm, and a handle at the upper end of the bar, the lower portion of the bar being notched longitudinally thereof.

2. In a device of the character described the combination of a supporting member having its lower end bent at an angle thereto and provided with a perforation for the reception of a bolt or rivet and having a series of similar perforations above the bent portion for attaching it to the various depths of scalding-crates or cooking-pans, and a bar pivoted to the upper end of the supporting-arm and provided with a plurality of notches.

3. In a device of the character described the combination of a pair of supporting members having attaching means at their base, a transverse rod connecting their upper ends, and a bar pivoted on the transverse rod and provided with a plurality of notches.

4. In a device of the character described the combination of a pair of supporting members having attaching means at their base, a transverse rod connecting their upper ends, a pair of bars pivoted thereon having two of their corresponding ends connected by a handle and provided longitudinally with a plurality of notches.

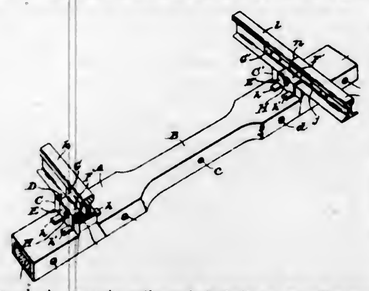
5. In a supporting device in the class described, the combination of supports adapted to be arranged at opposite sides in a vessel, each support embodying an arm adapted to be attached at its lower end portion to a crate or the like, and a bar movably secured to the upper portion of each arm and having its lower portion notched longitudinally thereof, the notched portion of the bar being adapted to engage the sides of the vessel as specified.

812,547. BICYCLE-SUPPORT. GEORGE F. COOK, East Washington, N. H. Filed May 31, 1905. Serial No. 263,107.

Claim.—1. In a bicycle-support, a frame, a clamp secured to the frame and provided with an ear having a rectangular-shaped opening, a pin having an intermediate rectangular portion for engagement in said opening to prevent rotation of the pin, a disk mounted upon each end of the pin adjacent the said ear, each disk having a circular opening for engagement with a circular portion of said pin to permit of rotation of the disks, a leg connected to each disk for engagement with the ground to support the bicycle, and means for holding the free ends of the said legs out of contact with the ground.

2. In a bicycle-support, a frame, a clamp secured to the frame and provided with an ear having a rectangular-shaped opening therein, a pin having a rectangular intermediate portion for engagement in said opening to prevent rotation of said pin, a disk mounted for rotation upon the pin adjacent each side of the said ear, each disk having ears secured upon its outer face, a supporting-leg secured to the ears of each disk, said supporting-legs each being of sections hingedly connected together, and means upon the frame for receiving the free ends of the supporting-legs when not in supporting position.

812,548. RAIL-TIE AND RAIL-JOINT COMBINED. RUSSELL P. COOK, St. Augustine, Fla. Filed Nov. 4, 1905. Serial No. 285,812.



Claim.—1. A composite railway-tie including a metallic main part comprising sides and a top and provided with elevated hollow rail-chairs having bolt-holes therein, a concrete body in the main part extending into the hollow rail-chairs, bolts fitting in the bolt-holes, and pairs of clips having bolt-holes therein to receive the bolts.

2. A composite railway-tie including a metallic main part comprising sides and a top and provided with elevated hollow rail-chairs having bolt-holes therein, a plurality of stay-rods extending from side to side of the main part and secured thereto, a concrete body in the main part extending about the stay-rods and into the hollow chairs, bolts fitting in the bolt-holes, and pairs of clips having bolt-holes therein to receive the bolts.

3. A railway-tie and rail-joint combined comprising a metallic main part provided with elevated rail-chairs for supporting abutting rail ends and having horizontal bolt-holes therein, rail-fastening clips for holding the rail ends on the chairs and provided with perforated splice-bars for holding the rail ends together, the clips having bolt-holes therein, bolts fitting in the bolt-holes of the chairs and the clips, and a concrete body in the main part and extending into the rail-chairs.

4. A railway-tie including a metallic main part provided with elevated hollow rail-chairs having gage-ears at the tops thereof, a concrete body in the main part extending into the rail-chairs, clips for holding rails on the chairs, and bolts for securing the clips to the sides of the chairs.

5. A composite railway-tie including a metallic main part comprising a top provided with integral gage-ears and sides attached to the top, a concrete body in the main part, and pairs of rail-clips attachable to the top of the main part.

6. A railway-tie and rail-joint combined comprising a main part having bolt-holes therein, rail-fastening clips for holding the rail ends on the main part and provided with perforated splice-bars for holding the rail ends together, the clips having bolt-holes therein, and bolts fitting in the bolt-holes of the main part and the clips.

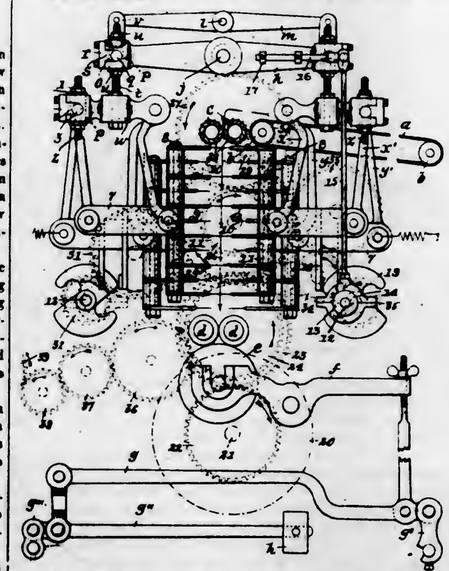
812,549. EXTENSION GAS-CHANDELIER. WILLIAM E. COTTON and LEVI C. MOOR, Kansas City, Mo. Filed Sept. 21, 1904. Serial No. 225,384.

Claim.—1. In an extension gas-chandelier, the combination of an outer fixed pipe having an internal annular shoulder near its lower end, an inner pipe slidably fitted in the outer pipe and having an external annular shoulder extending to the wall of the outer pipe, a cushion on the internal annular shoulder of the inner pipe arranged to receive the impact of the external shoulder on the inner pipe, a longitudinally-movable cup mounted on the end of the outer pipe and encircling the inner pipe, means for moving said cup longitudinally of the pipes, and an elastic ring inclosed within said cup bearing against the end of the outer pipe and arranged to frictionally embrace the inner pipe and hold the two pipes in their relative adjustment.

2. A pair of pipes fitting telescopically together, a cup fitting upon and having a sliding relation with the inner one and longitudinally adjustable on one end of the outer one, a combined gasket and clamp-ring fitting between the cup and the outer pipe and externally embracing the inner pipe, a lever suitably supported to prevent downward movement of the cup, and means for imparting vertical movement to said lever to press the cup upward or leave it free to move downward.

3. An extension gas-chandelier, comprising a pair of pipes fitting telescopically together, a cup adjustable longitudinally of the outer pipe, a combined gasket and clamp-ring fitting between the cup and the outer pipe and externally embracing the inner pipe, a lever supported from the outer pipe and pivotally movable only and having one end underlying the cup and its opposite end provided with a threaded passage, a rod having threads engaging said threaded passage, and means rigid with said outer pipe affording a bearing for the upper end of said rod.

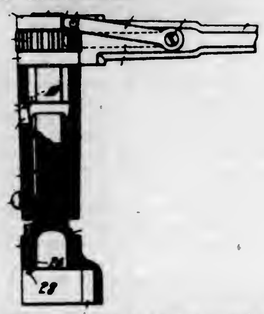
812,550. COMBING AND DRAWING MACHINE. EDOUARD CREPY and LOUIS FRENAUX, Brussels, Belgium. Filed June 14, 1902. Serial No. 111,618.



Claim.—The combination of comb structures, means for maintaining the material to be combed in operative contiguity to the combs and extended vertically, a rocking structure, means for rocking said rocking structure, links pivotally suspending said comb

structures from said rocking structure, and means for moving said comb structures to and from the material, substantially as described.

812,551. WRENCH. NAPOLEON DELISLE, St. Tite, Canada. Filed June 1, 1905. Serial No. 263,372.



Claim.—1. In a wrench, a shank terminating in a bifurcated head portion, a rotatable stem mounted in perforations in said head, there being a recess in one end of said stem, a spring-catch secured adjacent said recess, a ratchet-wheel on said stem within said bifurcated head, pawls adapted to engage said ratchet, a removable extension having a non-circular opening longitudinally thereof, a slidable non-circular stem secured therein, a spring-catch on said non-circular stem, and a nut-socket adapted to interlock with said catch.

2. In a wrench, a shank terminating in a bifurcated head portion, a rotatable stem mounted in perforations in said head, there being a recess in one end of said stem, a spring-catch secured adjacent said recess, a ratchet-wheel on said stem within said bifurcated head, pawls adapted to engage said ratchet, a removable extension having a non-circular opening longitudinally thereof, a slidable non-circular stem secured therein, there being a channel in said stem, a set-screw in said extension adapted to bear in said channel, a spring-catch on said non-circular stem, and a removable nut-socket adapted to interlock with said catch.

812,552. AXLE-LUBRICATOR. CHARLES H. DRIVER, Tarpon Springs, Fla., assignor of one-half to William W. K. Decker, John K. Chaney, and Hayes Bigelow, Tarpon Springs, Fla. Filed Nov. 23, 1904. Serial No. 234,526.

Claim.—1. In a device of the class described, the combination of an axle having a spindle and provided with a short lubricant-passage extending from the body of the axle at a point beyond the spindle through the inner portion of the latter and terminating at the bottom thereof and at a point between the ends of the same, a stationary axle-skein rigidly secured on the spindle, one of the said parts being provided with an annular recess forming an interior chamber and communicating with the said lubricant-passage to receive the lubricant, and a sleeve of absorbent material arranged within the said chamber for controlling the flow of lubricant.

2. In a device of the class described, the combination with a rotary axle-box, of an axle provided with a spindle having an annular groove at an intermediate point to form a lubricant-chamber, said axle being also provided with a lubricant-passage extending from the said chamber through the inner portion of the spindle to a point beyond the latter, and a stationary axle-skein fitting within and having an exterior bearing-surface to receive the rotary axle-box, said axle-skein being rigidly secured on the spindle and provided at intervals with openings communicating with the said chamber.

3. In a device of the class described, the combination with a rotary axle-box, of an axle provided with a spindle having an annular groove at an intermediate point to form a lubricant-chamber, said axle being also provided with a lubricant-passage extending from the said chamber through the inner portion of the spindle to a point beyond the latter, a stationary axle-skein fitting within and having an exterior bearing-surface to receive the rotary axle-box, said axle-skein being rigidly secured on the spindle and provided at intervals with openings communicating with the said chamber, and a lubricant-receptacle mounted on the body of the axle and communicating with the lubricant-passage.

4. In a device of the class described, the combination of an axle having a spindle and provided with a lubricant-passage extending through the inner portion of the spindle to a point beyond the same and terminating at the top of the axle, a stationary axle-skein fitted on the spindle and having its inner end detachably interlocked with the body portion of the axle, said skein being provided at intervals with openings, and one of the said parts having an annular groove forming an interior annular chamber communicating with the said lubricant-passage, and an axle-nut mounted on the spindle and engaging the outer end of the skein to retain the latter in its interlocked relation with the axle.

5. In a device of the class described, the combination of an axle having a spindle provided with an annular groove located at an intermediate point on the spindle and forming a lubricant-chamber, said axle being also provided with a lubricant-passage extending through the inner portion of the spindle to a point beyond the same and communicating with the said chamber, a stationary axle-skein detachably interlocked with the body portion of the axle and provided with openings, a sleeve of absorbent material arranged within the said chamber, and an axle-nut engaging the skein and retaining the same in its interlocked relation with the axle.

6. In a device of the class described, the combination of an axle having a lubricant-passage extending from the spindle to a point beyond the same, and a stationary axle-skein arranged on the spindle and provided with openings for the discharge of the lubricant, said skein being provided at opposite sides of the openings with short grooves disposed transversely of the skein.

812,553. TYMPAN-OFFSET PAPER FOR PRINTING-PRESSES. ALFRED B. DUREY, New York, N. Y. Filed Mar. 8, 1905. Serial No. 249,055.

Claim.—1. An offset tympan paper or sheet for a printing-press, having one of its faces rendered relatively non-absorbent and its other face relatively absorbent, and having said absorbent face treated with a mineral oil.

2. An offset tympan paper or sheet for a printing-press, having a back ply of strong, hard-sized paper, and a face ply of thinner, slack-sized paper, the two plies being united and the front ply treated with a mineral oil.

3. An offset tympan paper or sheet for a printing-press, consisting of two plies felted together in their manufacture, one of said plies being of strong and relatively non-absorbent paper, and the other ply being of relatively soft, absorbent paper treated with a mineral oil.

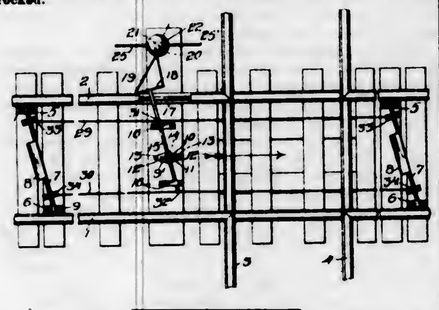
812,554. ALKAMIN ESTERS OF PARA-AMINOBENZOIC ACID. ALFRED EINHORN, Munich, Germany, assignor to Farbwerke vorm. Meister Lucius & Brüning, Höchst-on-the-Main, Germany, a Corporation of Germany. Filed Nov. 8, 1905. Serial No. 286,360.

Claim.—1. As new products, the alkamin esters of para-aminobenzoic acid, being colorless compounds, little soluble in water, but readily soluble in alcohol, ether and benzene, of alkaline reaction on litmus, decomposed when heated with acids or alkalies with formation of para-aminobenzoic acid and an alkamin, forming salts soluble in water to a neutral solution which produces local anæsthesia without causing any irritation.

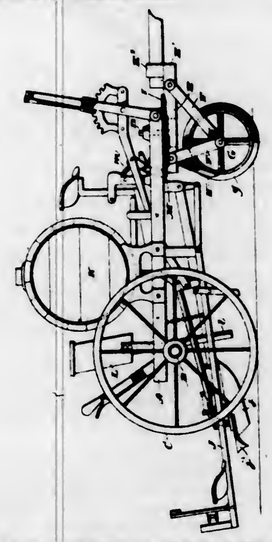
2. As a new product, the alkamin ester para-aminobenzoyl-diethylaminoethanol being a colorless compound very little soluble in water, very readily soluble in alcohol, ether and benzene, solidifying in the cold and of alkaline reaction on litmus, decomposed, when heated with hydrochloric acid or soda-lye, into para-aminobenzoic acid and diethylaminoethanol, forming a salt with one equivalent of hydrochloric acid which crystallizes from absolute alcohol in needles melting at 156° centigrade the solution of which is of anæsthetic action without causing irritation.

812,555. RAILWAY-SIGNAL. NICHOLAS EMONDS, Hilton, S. D. Filed May 5, 1905. Serial No. 258,013.

Claim.—In a railroad-signal apparatus, main rails and crossing-rails, a rock-shaft disposed between the main rails upon opposite sides of the crossing-rails, each shaft including a projection, a pivoted shaft arranged between one of the rock-shafts and the crossing, the pivoted shaft having an arm secured thereto, a vertical shaft arranged adjacent the main and crossing rails, a flexible connection between the aforesaid arm and the vertical shaft, signaling elements associated with the vertical shaft, and means constructed and arranged to operate said signaling elements when either of the rock-shafts is rocked.



812,556. TRANSPLANTER. WILLIAM FETNER, Middletown, Ohio. Filed Sept. 5, 1905. Serial No. 277,479.



Claim.—1. In combination, a furrow-opener, and means positioned in advance of the furrow-opener for forming a groove in the ground and packing the earth at each side thereof to facilitate the formation of the furrow.

2. In combination, a furrow-opener and a flanged wheel positioned in advance of said furrow-opener.

3. In combination, a furrow-opener, and a flanged caster-wheel positioned in advance of said furrow-opener.

4. In combination, a furrow-opener, and a wheel positioned in advance thereof, said wheel having a centrally-disposed flange and flat bearing-surfaces at each side thereof.

5. In combination, a furrow-opener, means positioned in advance of the furrow-opener for forming a groove in the ground, and a fertilizer-distributer arranged to discharge into said groove.

6. In combination, a furrow-opener, a flanged wheel positioned in advance of the furrow-opener, and a fertilizer-distributer positioned in advance of the furrow-opener and arranged to discharge into the groove formed by the flanged wheel.

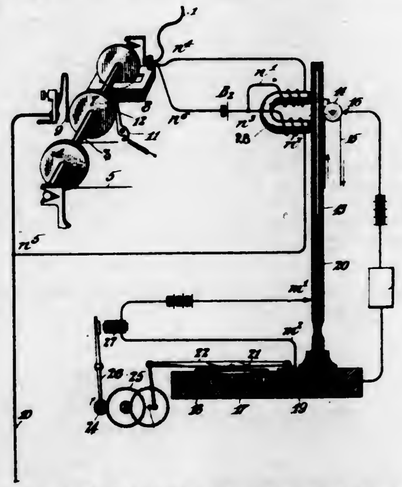
7. In combination, a furrow-opener, a wheel arranged in advance of said furrow-opener, said wheel being provided with a centrally-disposed flange and flat bearing-surfaces at each side thereof, and a fertilizer-distributer adapted to discharge into the groove formed by the flange of said wheel.

8. In combination, a furrow-opener, a flanged caster-wheel positioned in advance of said furrow-opener, and a fertilizer-distributer adapted to discharge into the groove formed by the flanged caster-wheel.

9. In combination, a furrow-opener, means positioned in advance of said furrow-opener for forming a groove in the ground, a fertilizer-distributer adapted to discharge into said groove, and covering means positioned in rear of said furrow-opener.

10. In combination, a furrow-opener, a flanged wheel positioned in advance of said furrow-opener, a fertilizer-distributer adapted to discharge into the groove formed by the flanged wheel, and covering-plates positioned in rear of said furrow-opener.

812,557. METHOD OF RECEIVING TELEGRAPHIC SIGNALS. STEPHEN D. FIELD, Stockbridge, Mass. Filed June 10, 1905. Serial No. 264,676.



Claim.—1. The method of detecting vibratory currents of a constant periodicity which consists in subjecting a vibratory body to the influence of said currents and simultaneously gradually altering the periodicity of said body until it is in tune with that of said currents.

2. The method of signaling which consists in subjecting a vibratory body to successive impulses, and simultaneously gradually changing the periodicity of the vibratory body until its periodicity corresponds to that of the impulses.

3. The method of bringing a vibratory body into synchronism with impulses of a constant periodicity, which consists in subjecting it to the influence of said impulses, and simultaneously continuously changing the periodicity of said body from minimum to a maximum or vice versa, until its periodicity corresponds to that of the vibratory impulses, and finally automatically stopping said changes when such correspondence is obtained.

4. The method of signaling which consists in transmitting electric impulses of a fixed periodicity, receiving such impulses in a coherer which forms part of a local circuit including a magnet, and subjecting a vibratory body to the influence of said magnet and gradually changing the periodicity of said body.

5. The method of signaling which consists in receiving impulses in a coherer which forms part of a local circuit including a battery and a magnet, subjecting a vibratory body to the influence of said magnet, gradually changing the periodicity of said body and finally closing a local circuit by means of said body.

6. The method of signaling which consists of receiving impulses in a coherer, each impulse being composed of periodic currents of high frequency, establishing a local circuit through the coherer by means of said periodic currents whereby the periodic currents are transformed into simple impulses in the local circuit, and subjecting a me-

chanical vibrator having a continuously-changing periodicity to said local impulses.

7. The method of signaling which consists in initially tuning a

recesses, adjusting means coöperating with the bridge-bar, springs carried in the recesses and coacting with the bridge-bar, and folding

surrounding the same and fixed thereto, and a bulb-sheath extend-

or stud on the front end of the said lever, a lug on the said stud to en-

chanical vibrator having a continuously-changing periodicity to said local impulses.

7. The method of signaling which consists in initially transmitting high frequency waves, divided into separate impulses to a coherer, establishing a circuit including a local battery through the coherer by means of said periodic currents whereby the periodic currents are transformed into single impulses in the local circuit, subjecting a mechanical vibrator having a gradually-changing periodicity to said impulses and finally fixing the periodicity of said vibrator.

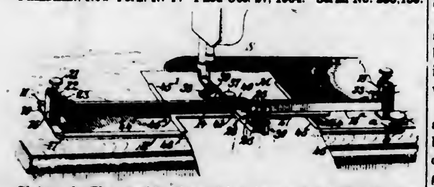
8. The method of detecting vibratory currents which consists in subjecting a vibratory body to the influence of said currents and continuously changing the periodicity of the body until it is attuned to said vibratory currents and then finally fixing the periodicity of said vibratory body.

9. The method of signaling which consists in transmitting high-frequency waves divided into impulses, transforming said waves into simple impulse-currents, transforming said currents into pulsating magnetic force of corresponding periodicity; subjecting a mechanical vibrator having a gradually-changing periodicity to said magnetic force, and finally transforming the vibrations of said mechanical vibrator into sound.

10. The method of signaling which consists in transforming electric emanations or waves separated into groups of a certain periodicity into simple impulse-currents, transforming said impulse-currents into pulsating magnetic force, subjecting a mechanical vibrator having a changing periodicity to said pulsating magnetic force, and finally fixing the periodicity of the mechanical vibrator when it is attuned to said magnetic force.

11. The method of signaling which consists in transforming electric emanations or waves into simple impulse-currents, transforming said impulse-currents into pulsating magnetic force, subjecting a mechanical vibrator having a changing periodicity to said magnetic force and finally automatically fixing the periodicity of said vibrator when it is attuned to the magnetic impulses.

812,558. **TUCK-GUIDE FOR SEWING-MACHINES.** SAMUEL FRIEDMAN, New York, N. Y. Filed Oct. 27, 1904. Serial No. 230,169.



Claim.—1. The combination with a base, of a bridge-bar extending above the base, an arm projecting from the bridge-bar, a block movable upon the arm, a folding-blade carried by the block, and a folding member with which the blade coacts.

2. The combination with a base, of a bridge-bar extending above the base, an arm projecting from the bridge-bar, a block movable upon the arm, a folding-blade movable upon the block, and a folding member with which the blade coacts.

3. The combination with the base of a bridge-bar extending above the base and longitudinally thereof, a folding member mounted upon the base, a folding-blade mounted upon the bridge-bar and a retaining member attached to the bridge-bar and adjustable with respect to the folding member.

4. The combination with a base of a bridge-bar extending above the base and longitudinally thereof, an arm projecting from the bridge-bar, a folding-blade movably mounted upon the arm, a folding member attached to the base, and coacting with the folding-blade, and a retaining member movably mounted upon the arm and adjustable with respect to the folding-blade.

5. The combination with a base, of a bridge-bar extending longitudinally above the base, plates overlapping one another upon the bridge-bar to which they are secured and having guide portions, and folding members situated between the guide portions.

6. The combination with a base, of a bridge-bar extending longitudinally above the base, plates overlapping one another and being provided with slots extending longitudinally of the bridge-bar, a securing device extending through the slots and engaging the bridge-bar, guides carried by the plates, and folding members situated between the guides.

7. The combination with a base, of standards rising therefrom and having recesses, a bridge-bar extending between the standard-recesses, adjusting means cooperating with the bridge-bar, springs carried in the recesses and coacting with the bridge-bar, and folding members mounted upon the base and bridge-bar.

8. The combination with a base, of standards rising therefrom, a bridge-bar extending between the standards, locking members mounted upon the bridge-bar, means for forcing the locking members into contact with the bridge-bar and standards, and folding members mounted upon the base and bridge-bar.

9. The combination with a folding member, of a reversible supporting member having faces lying at different angles with respect to the folding member, and a folding-blade which may be mounted upon said faces of the supporting member.

10. The combination with a base, of a bridge-bar extending above the base, a folding member mounted upon the base, a block carried by the bridge-bar and having one end parallel to the folding member and one end inclined thereto, and a folding-blade attachable to either end of the block.

11. A tucking device comprising a base, coacting folding members mounted thereon, and converging guide members situated at opposite sides of said coacting folding members and adapted for contact with the edges of the work.

12. The combination with a base provided with a way, of a plate movable in the way and having spaces at its ends, a folding member carried by the plate, standards rising from the base through the plate-spaces, a bridge-bar extending between the standards, and a folding-plate mounted upon the bridge-bar.

13. The combination with a base provided with a way, of a plate movable in the way, a folding member carried by the plate, standards rising from the base, a bridge-bar extending between the standards, a folding-plate mounted upon the bridge-bar, and guides supported beneath the bridge-bar at each side of the folding elements.

14. The combination with a base provided with a way, of a plate movable in the way, a folding member carried by the plate, standards rising from the base, a bridge-bar extending between the standards, a folding-plate mounted upon the bridge-bar, guides supported beneath the bridge-bar at each side of the folding elements, and a screw extending through the bridge-bar and engaging the guides.

15. The combination with a base, of a bridge-bar extending above the base, folding members mounted upon the base and bridge-bar, and guides carried by the bridge-bar at opposite sides of the folding members, one of said guides being provided with a slot through which its companion extends.

16. The combination with a base, of a bridge-bar extending above the base, folding members mounted upon the base and bridge-bar, independently-adjustable guides carried by the bridge-bar at opposite sides of the folding members, each of said guides having a groove to receive the work, and means common to both guides for fixing their position.

17. The combination with a base, of a folding member mounted thereon, a bridge-bar extending above the base, an arm extending upon opposite sides of the bridge-bar, a folding-blade carried by the arm at one side of the bridge-bar, and a retaining member carried by the arm at the opposite side of the bar.

18. The combination with a base, of a bridge-bar supported thereon, coacting folding members, one of which is mounted on the bridge-bar, and independently-movable guide members situated at opposite sides of the folding members and having engagement with one another.

19. The combination with a base, of a bridge-bar supported thereon, coacting folding members, one of which is mounted on the bridge-bar, independently-movable guide members situated at opposite sides of the folding members, and means common to both guide members for fixing them in position.

20. The combination with a base, of coacting folding members mounted for movement along said base, and guide members situated at opposite sides of the folding members and having projections extending over the sides of the base.

812,559. **CLINICAL THERMOMETER.** WILLIAM F. FRUEHAUF, Plainfield, N. J. Filed Apr. 1, 1905. Serial No. 253,356.

Claim.—1. A clinical thermometer having a sleeve affixed thereto by means of cement, and a bulb-sheath extending beneath said sleeve into said cement.

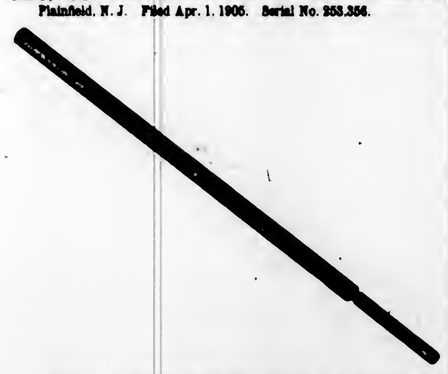
2. The combination, with a clinical thermometer, of a sleeve surrounding the same and fixed thereto, and a bulb-sheath extending at its open end beneath said sleeve, said end being flared.

3. The combination, with a clinical thermometer, of a sleeve surrounding the same, cement interposed between said sleeve and said thermometer, and a sheath inclosing the bulb of the thermometer, and provided with a flared end disposed beneath said sleeve and embedded in said cement.

4. The combination, with a clinical thermometer, of a sleeve fixed to the same, by means of cement, at the junction of the bulb and tube portions, and provided at the end near the latter with screw-threads, a bulb-sheath extending beneath said sleeve and retained by said cement, and a tube-sheath having screw-threads engaging those of said sleeve.

5. The combination, with a clinical thermometer, of a tube-protecting sheath, a bulb-protecting sheath, a sleeve fixed to the thermometer and retaining said sheaths, and a cap attached to the tube-sheath and inclosing the bulb-sheath.

812,560. **CLINICAL THERMOMETER.** WILLIAM F. FRUEHAUF, Plainfield, N. J. Filed Apr. 1, 1905. Serial No. 253,356.



Claim.—1. A clinical thermometer having in the bulb thereof a helical partition of a width corresponding to the inner diameter of said bulb.

2. A clinical thermometer having a helical partition extending between diametrically opposite points in the side wall of the bulb.

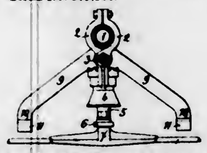
3. In a clinical thermometer, a helically-twisted plate or partition welded at both side edges to the inner surface of the bulb.

4. In a clinical thermometer, a helically-twisted partition extending longitudinally of the bulb and welded throughout the length of both side edges to the side wall of the same.

5. A clinical thermometer having a partition attached at both side edges to the side wall of the bulb and spaced from the ends thereof.

6. A clinical thermometer having a helical partition in the bulb thereof attached at both side edges to the side wall of the same and spaced from the ends thereof.

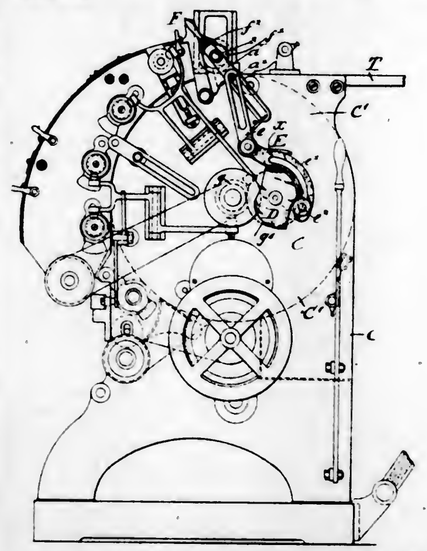
812,561. **OVERHEAD LINE.** EMILE GIRAUD, Paris, France. Filed Oct. 31, 1903. Serial No. 179,376.



Claim.—1. In overhead trolley construction, in combination, a support, an insulating-bell carried therebelow, a line-wire, a lever pivoted at said bell moving in a horizontal plane, a pivotal connection between said line-wire and said lever, said lever having a rear extension beyond said bell, and discharge-arms carried rigidly by said support and lying in the path of said extension to be struck thereby.

2. In an insulator for high-tension lines the combination of an insulating-bell, a vertical pivot or stud fixed underneath the bell, a two-arm horizontal lever pivoted on the said stud, a vertical pivot or stud on the front end of the said lever, a lug on the said stud to receive a wire, and a V-shaped relieving-piece secured outside the bell and having laterally and downwardly extending arms and forwardly-extending and downwardly-bent parts so arranged as to be touched by the rear end of the aforesaid lever.

812,562. **BRONZING-MACHINE.** LOUIS HAENLEIN, East Rutherford, N. J., assignor to The Fuchs & Lang Manufacturing Co., New York, N. Y., a Corporation of New York. Filed Sept. 7, 1905. Serial No. 277,403.



Claim.—1. In a bronzing-machine, the combination, with the shaft of the sheet-carrying cylinder, of a double cam rotated by the same, a fulcrumed lever provided with a curved slotted and graduated arm, an adjustable antifriction-roller on said arm, means for permanently maintaining said roller against said cam, an oscillating lever mounted on the shaft of the supply-roller, means for connecting the oscillating lever with the upper arm of the fulcrumed lever, and a pawl-and-ratchet mechanism operated by the oscillating lever for transmitting the proper motion to the supply-roller.

2. In a bronzing-machine, the combination, with the shaft of the sheet-carrying cylinder, of a double cam rotated by the same, a fulcrumed lever adjacent to said cam and provided with a lower curved slotted and graduated arm, an antifriction-roller adjustable in the slot of the curved lower arm, means for maintaining said antifriction-roller in permanent engagement with said cam, a supply-roller for the bronze-fountain, an oscillating lever placed on the shaft of said supply-fountain, means for connecting the lower end of the oscillating lever with the upper end of the fulcrumed lever, and a pawl-and-ratchet-wheel mechanism between the oscillating lever and the shaft of the supply-roller.

812,563. **VEHICLE-WHEEL.** MAURICE G. HEITZ-BOYER, Paris, France. Filed July 25, 1905. Serial No. 271,213.

Claim.—1. In a vehicle-wheel, the combination, with a rim, of a plurality of blocks bearing against the same, toggle-links connecting certain of said blocks at either side thereof, and spokes forming in connection with said links a plurality of toggle-joints.

2. In a vehicle-wheel, in combination, with the rim, a plurality of blocks bearing against the same, toggle-links connecting certain of said blocks, and spokes directly connected with the joints of said toggle-links.

3. The combination, with the rim and the spokes, of shoes or blocks movable longitudinally to the former and disposed toward and between the latter, and toggle-links connecting adjacent shoes and having their intermediate joints connected to the spokes.

4. In a vehicle-wheel, the combination of a rim *g*, shoes *i* bearing

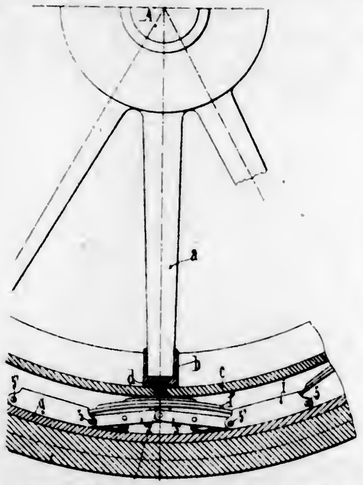
against the same between the spokes, carriages or slides 6 movable longitudinally to said shoes, leaf-springs *f* connecting adjacent

2. The combination with a suitable vessel, of a lid adapted to

a predetermined elevation, and to cause said lock to automatically

Claim.—A churn-cover comprising a top having a central open-

against the same between the spokes, carriages or slides 6 movable longitudinally to said shoes, leaf-springs *f* connecting adjacent carriages, toggle-links connecting said shoes, and spokes attached to said leaf-springs intermediately between the same and to the intermediate joints of said toggle-links.



5. In a vehicle-wheel, the combination, with the inner and outer rims, of shoes disposed between said rims and bearing against the outer rim, toggle-links connecting adjacent shoes, slides movable longitudinally to said shoes, springs connecting adjacent slides, and spokes protruding into the space between said rims and bearing against the intermediate joints of said toggle-links.

6. In a vehicle-wheel, the combination with a rim having side portions, of a plurality of blocks or shoes movable longitudinally thereto and each divided longitudinally into sections, toggle-links connecting certain of said blocks or shoes, spokes forming in connection with said links a plurality of toggle-joints, and means governed by the movement of said links for laterally separating said block-sections and forcing the same against the sides of said rim.

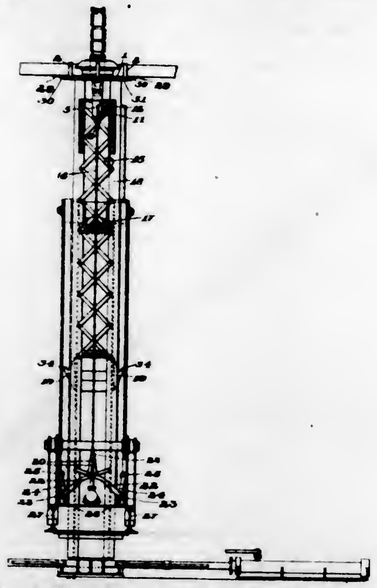
7. In a vehicle-wheel, the combination with a rim having side walls, of a plurality of blocks or shoes bearing against said rim at the face thereof which is disposed toward the hub, each of said blocks being divided longitudinally into sections, toggle-links connecting certain of said blocks, being attached to the corresponding sections thereof, spokes forming in connection with said toggle-links a plurality of toggle-joints, transverse sleeves carried by each of said block-sections, the sleeves of the sections of the same block having coöperating cam-faces, and springs acting on the sleeve of one block-section of each block for limiting the angular movement thereof.

812,564. COOKER. WILLIAM G. HENDERSON and JOSEPH W. WEBB, Oil City, Pa. Filed July 3, 1905. Serial No. 268,200.

Claim.—1. In a cooking utensil of the character described, the combination with a vessel, of a lid adapted to fit upon said vessel, said lid having diametrically-opposed open-ended slots formed therein, a handle carried by said lid, a perforated receptacle adapted to be supported within said vessel, upwardly-extending rods carried by said receptacle, prongs carried by said rods and adapted to engage upon the sides of said slots, substantially as described.

2. The combination with a suitable vessel, of a lid adapted to fit upon said vessel, said lid having open-ended slots formed therein, a perforated receptacle adapted to be suspended within said vessel, two vertically-disposed resilient handles, one connected to said receptacle at each side thereof, said handle being formed each with a plurality of integral laterally-extending prongs engaging the lid of the vessel to adjustably suspend said receptacle within said vessel, substantially as described.

812,565. SAFETY LOCKING DEVICE FOR CRANES. CHARLES R. HINCHMAN, Cleveland, Ohio. Filed Oct. 20, 1905. Serial No. 283,646.



Claim.—1. The combination with a crane-mast and a vertically-movable crane-jib, of a lock for locking the crane-jib and preventing downward movement thereof, and means for automatically moving the lock into and out of its locking position.

2. The combination with a crane-mast and a vertically-movable crane-jib, of a lock for locking the crane-jib and preventing downward movement thereof, and means, actuated by the rotation of the crane, for automatically moving the lock into and out of its locking position.

3. The combination with a rotary crane-mast and a vertically-movable crane-jib, of a lock on the crane for locking the crane-jib at predetermined positions and preventing its downward movement, and means for automatically moving the lock into and out of its locking position.

4. The combination with a rotary crane having a mast and a vertically-movable jib, means for rotating the crane, and means for raising and lowering the jib, of a lock adapted to lock the jib on the mast and prevent its downward movement, means on the mast for operating the lock, means for normally automatically holding the lock in its inoperative position, and a stop adapted to contact with the lock-operating mechanism and automatically hold the lock in its operative position.

5. The combination with a crane and vertically-movable crane-jib, of a lock on the crane-jib, a stop on the crane-mast to be engaged by said lock, automatic devices on the crane-mast to operate said lock and to cause the same to automatically engage said stop and prevent the downward movement of the crane-jib, and to cause said lock to become automatically disengaged from said stop and be held in its inoperative position.

6. The combination with a crane-mast and a vertically-movable crane-jib, of a lock on the crane-jib, a stop on the crane-mast, for engagement with said lock, automatic mechanism on the crane-mast to operate said lock and to cause the same at predetermined positions of the crane-jib to automatically engage the stop and hold the jib at a predetermined elevation, and to cause said lock to automatically disengage from said stop and permit the normal movement of the crane-jib.

7. The combination with a crane-mast and a vertically-movable crane-jib, means for rotating the crane and raising and lowering the jib, of a roller or the like affixed, by means of suitable connections, to the crane-mast, a track intermittently contacting with said roller and when so contacting exerting downward pressure thereon, a guide-bar connected to said roller, a lever connected to said guide-bar, said lever engaging with a cable connected to and operating safety locking devices for locking the crane-jib at a predetermined position, and means for automatically unlocking and permitting the normal movement of the same.

8. The combination with a crane-mast and a vertically-movable crane-jib, of a bearing device connected by suitable means to the crane-mast, a track intermittently contacting with said bearing device, for operating, through intermediate connections, safety locking mechanism for locking the crane-jib to the crane-mast at a predetermined elevation and position of the crane-jib, and means for automatically unlocking the same and permitting its normal movement and operation.

9. The combination with a crane-mast and a vertically-movable crane-jib, of brackets on the crane-mast, levers connected to bars having latch-pins, the same constituting a locking mechanism and flexibly connected by a cable to automatic lock-operating devices on the crane-mast, whereby the crane-jib is held securely at a predetermined elevation when occupying certain positions in its circular travel, and means for automatically releasing the locking mechanism and permitting the normal operation of the crane.

10. In combination with a crane-mast and vertically-movable crane-jib, stops on the crane-mast, arranged to be engaged by latches on the crane-jib, means for automatically inwardly and outwardly moving said latches at predetermined times at a predetermined elevation of the crane-jib, to cause the engagement and disengagement of said stops and latches.

11. In combination with a crane-mast and vertically-movable crane-jib, stops on the crane-mast, latches on the crane-jib adapted to engage and disengage said stops and means for causing said latches to automatically engage and disengage said stops at predetermined times in the operation of the crane and at predetermined elevations and positions of the crane-jib.

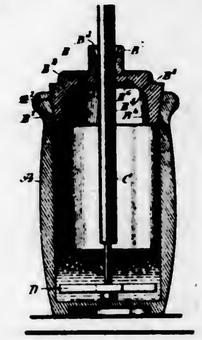
12. In combination with a crane-mast and vertically-movable crane-jib, a bearing device having connection with and adapted to follow on a concentric path the circular movements of the crane-mast, a track traveled by said device and exerting downward pressure thereon when in certain arcs of its circular travel thereby through intermediate connections, causing latches on the crane-jib to automatically engage with stops located on the crane-mast when the crane-jib assumes certain positions and causing the said latches to automatically disengage said stops when out of such positions.

13. In combination with a crane-mast and a vertically-movable crane-jib, a bearing device having intermediate connection with the crane-mast, tracks traveled by the bearing device and so arranged and at such different elevations that one part of the under surfaces of said tracks shall, at certain times in the rotary movement of the crane-mast and circular travel of the roller, be in contact with the bearing device exerting downward pressure thereon, and at other times in said movement shall be out of contact therewith, a guide-bar connected to said bearing device, a lever connected to said guide-bar, said lever engaging a cable connected to and operating safety locking devices located on the crane-jib and crane-mast for holding the crane-jib at predetermined times at certain predetermined elevations.

14. In combination with a rotary crane-mast and vertically-movable crane-jib, a roller connected by suitable means to the crane-mast and following its rotary movement, said roller traveling on the under surfaces of tracks located above the roller, portions of said track-surfaces being arranged at different elevations so as to contact intermittently with said roller, a guide-bar connected to the roller and also to a lever which is adapted to engage with a counter-weighted cable, engaging links pivotally connected to levers mounted on the crane-jib which are keyed to shafts operating eyebars having latch-pins at their upper portions adapted to engage stops mounted on the crane-mast for automatically holding the crane-jib while in certain arcs of its circular travel, at a predetermined elevation, and for automatically releasing it from such engagement and permitting its normal movement and operation.

812,566. CHURN-COVER. JAMES C. HOGUE, Whitesid, Tex. Filed July 15, 1905. Serial No. 269,834.

Claim.—A churn-cover comprising a top having a central opening for the dasher-rod, the wall of the opening being extended to form a handle and an annular side depending integrally from the said top and forming, with the latter, an exterior annular shoulder for stacking purposes.



812,567. DENTAL-INSTRUMENT HOLDER. JAMES W. IVORY, Philadelphia, Pa. Filed Sept. 27, 1905. Serial No. 280,333.

Claim.—1. In an instrument-holder of the character stated, a handle, a stationary jaw thereon, a rotary shaft mounted in said handle and having a shoulder on its end, a jaw, a movable carrier therefor, said shoulder and shaft having a threaded bore with which engages a threaded portion of said carrier, means for rotating said shaft and a bearing in the handle on which said shoulder is swiveled.

2. In an instrument-holder of the character stated, a handle, a rotary shaft which is mounted in said handle, a sleeve, a neck connecting said sleeve with said handle, a jaw on said sleeve, a movable shank in said sleeve having a threaded connection with said shaft, a jaw on said shank opposite to that on said sleeve and a shoulder on said shaft, said shoulder having a bearing on said neck.

3. In a holder of the character stated, a jaw adapted to clamp an implement or instrument, a shank carrying said jaw and an eye on said shank, said eye extending entirely through said shank to receive said implement or instrument and having a wall forming a continuity of the back of said jaw.

4. In an instrument-holder of the character stated, a jaw provided with an opening which is partly right-lined and partly round to interlock the implement or instrument applied to said jaw and prevent lateral movement thereof.

5. In an implement or instrument holder of the character stated, a jaw, a shank carrying the same, a longitudinally-extending recess in the face of said jaw and an eye on said shank back of said recess.

6. In an implement or instrument holder of the character stated, a jaw, a shank carrying the same, a longitudinally-extending recess in the face of said jaw, an eye on said shank back of said recess and serrations extending laterally in opposite directions from the walls of said recess.

812,568. RAZOR-STROP. FREDERICK KAMPFE, New York, N. Y. Filed Aug. 14, 1905. Serial No. 274,057.

Claim.—1. In a razor-strop, the combination with the leather portion of the strop having opposite edges notches near one end, of a longitudinally-split tube having end notches, a cord, the free ends of which are passed into and securely held by said split tube, with the

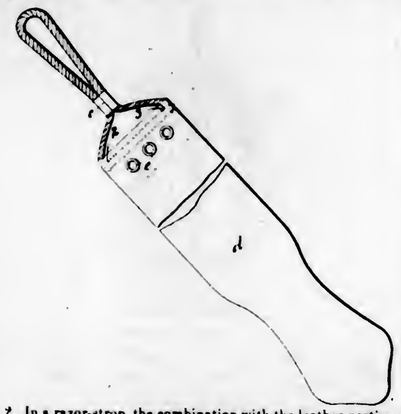
parts of the cord passing through the end notches and also through the notches formed in the edges of the leather of the strop at opposite

said support, a catch on the rod for engaging the support, and means for

ating from a central aperture, die-carriers in said guideways, dies attached to the inner ends of said carriers, a die-head, a pipe-brace

ed to be engaged by the said brace to hold the bottom in a folded po-

parts of the cord passing through the end notches and also through the notches formed in the edges of the leather of the strop at opposite places, said tube passing through the turned-over end of the strop and means for securing the said turned-over end to the main body of the strop.



2. In a razor-strop, the combination with the leather portion of the strop having opposite edge notches near one end, of a longitudinally-split tube in width agreeing with the leather portion and having end notches at the opposite side to the split or division, a cord, the free ends of which are passed into and securely held by said split tube, the parts of the cord passing through the end notches of the tube and also through the notches formed in the edges of the leather of the strop, said tube passing through the turned-over end of the strop, and a clip passing around and drawing together the parts of the cord slightly beyond the strop so as to form a closed loop at one end.

812,569. **TRIP CASING-SPEAR.** WILLIAM H. KESSELMAN, Parkersburg, W. Va. Filed Oct. 19, 1905. Serial No. 283,433.

Claim.—1. A casing-spear comprising a rod, movable jaws connected therewith, a catch on the rod for holding the jaws, and means for engaging the casing to retard the upward motion of the jaws when the rod is raised and to release them from the influence of said catch.

2. A casing-spear comprising a rod, movable jaws connected therewith, a catch on the rod for holding the jaws, and means for engaging the casing to retard the upward motion of the jaws when the rod is raised, and to release them from the influence of said catch, said means comprising a spring connected with the jaws and adapted to bear on the wall of the casing.

3. A casing-spear comprising a rod, a support mounted thereon, jaws connected with said support, a catch on the rod for engaging the support, and means for engaging the casing, said means being connected with said jaws.

4. A casing-spear comprising a rod having a conical surface tapering upwardly, a support mounted thereon, jaws connected with said support, a catch on the rod for engaging the support, and means for engaging the casing to retard the upward motion of the jaws when the rod is raised and release them from the influence of said catch.

5. A casing-spear comprising a rod having a conical surface tapering upwardly, a support mounted thereon, jaws connected with said support, a catch on the rod for engaging the support, and means for engaging the casing to retard the upward motion of the jaws when the rod is raised and release them from the influence of said catch; said means comprising a spring connected with the support and adapted to bear on the wall of the casing.

6. In a casing-support, the combination of a rod having a tapering surface on the lower part thereof, a catch on said rod, a ring adapted to be held in elevated position on the rod by said catch, links pivotally connected with the ring, jaws connected with said links and located in a position to be engaged by said conical surface when the rod is raised with respect to the ring, and springs mounted on said ring and adapted to bear on the wall of a well-casing, said springs having inwardly-projecting ends.

7. A casing-spear comprising a rod having a conical surface thereon tapering upwardly, a spring-catch on the rod having a shoulder thereon, a support movably mounted on the rod and adapted to be held in an elevated position by said catch, links pivotally connected with said support, jaws connected with said links and adapted to be engaged by said conical surface, and means for normally preventing the support from moving above said shoulder.

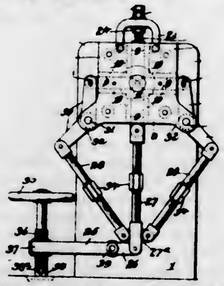
8. A trip casing-spear having a rod, a spring provided with a convex portion and a shoulder above the convex portion, a jaw-support adapted to be held by the convex portion of the spring, and means for preventing the support from moving above the shoulder.

9. A trip casing-spear having a rod, a spring provided with a convex portion and a shoulder above the convex portion, a jaw-support adapted to be held by the convex portion of the spring, and means for preventing the support from moving above the shoulder; said means comprising a movable dog adapted to engage the support, and means for moving the dog out of engagement with the support when the latter is moved downwardly with respect to the rod.

10. A casing-spear, comprising a rod, a movable jaw-support thereon, means for holding the support in a certain position on the rod, a pivoted dog bearing on the support when held in said position, and a counterweight for moving the dog out of engagement with the support when the latter is lowered from said position

11. A casing-spear comprising a rod, a spring-catch on the rod having a shoulder, a support movably mounted on the rod and adapted to be held in an elevated position by said catch, jaws movably connected with said support, and means for preventing the support from moving above said shoulder.

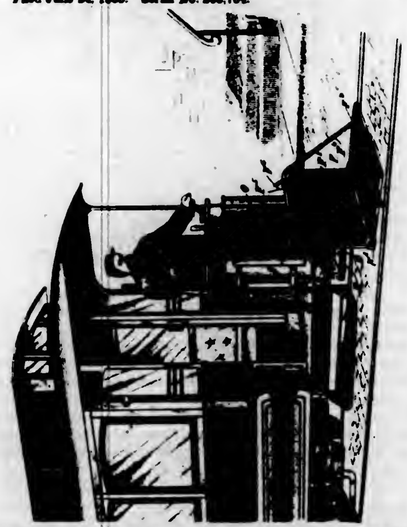
812,570. **APPARATUS FOR SHARPENING ROCK-DRILLING-MACHINE BITS.** JOSEPH A. G. KIRSTEN, Randfontein, Transvaal. Filed Mar. 15, 1905. Serial No. 250,151.



Claim.—1. In apparatus for sharpening rock-drilling bits, a main vertical plate, a second vertical plate fixed thereto and having a central aperture and vertical and horizontal guideways radiating from said aperture, die-carriers in said guideways, dies attached to said carriers, a device for adjustably supporting the top vertical die, levers pivoted to the second plate and connected to the horizontal die-carriers, a lever pivoted to the main plate and yieldingly connected with the bottom vertical die-carrier and with the levers operating the horizontal die-carriers, and means for operating the lever pivoted to the main plate.

2. In apparatus for sharpening rock-drilling bits, in combination, an upright plate having vertical and horizontal guideways radiating from a central aperture, die-carriers in said guideways, dies attached to the inner ends of said carriers, means for supporting the top vertical die-carrier in position, and means for moving the lower vertical die-carrier and the horizontal die-carrier toward and away from the central aperture, a dolly projected between the several dies and adapted to reciprocate between the same, means for supporting said dolly in position between the dies, and means for supporting the drill and taking the impact of the dolly on the drill.

812,571. **CAR-FENDER.** JOHN LANDAU, Jr., New York, N. Y. Filed June 24, 1905. Serial No. 266,784.



Claim.—1. A car-fender comprising a lever-frame fulcrumed on the car-body, a basket removably connected with the said lever-frame, spring-pressed rods pivotally connected with the said lever-frame, and a manually-controlled device for imparting a swinging motion to the said lever-frame and basket to bring the forward end of the basket the desired distance relative to the track.

2. A car-fender comprising a spring-pressed lever-frame fulcrumed on the car-body, a basket having its frame removably hung on the said lever-frame, means for locking the said basket-frame to the said lever-frame, and means for swinging the lever-frame and basket to move the forward end of the basket to and from the track.

3. A car-fender provided with a basket comprising a back, a bottom pivotally connected with the said back, and a brace pivotally connected with the said bottom and removably connected with the said back.

4. A car-fender provided with a basket comprising a back, a bottom pivotally connected with the said back, a brace made U shape and pivotally connected at its side arms with the sides of the said bottom, the middle portion of the brace being adapted to engage bearings on the said back, and means for locking the middle portion to the bearings.

5. A car-fender comprising a lever-frame on the car, a basket having a back, the side members of which are formed with hooks adapted to hook onto pins on the said lever-frame, and locking-pins engaging registering apertures in the said lever-frame and the said side members.

6. A car-fender provided with a basket comprising a back having side members provided with notches near the upper end, a bottom pivotally connected with the lower end of the said back, and a U-shaped brace having its side arms pivotally connected with the sides of the said bottom, the middle portion of the said brace being adapted to engage the said notches.

7. A car-fender provided with a basket comprising a back having side members provided with notches near the upper end, a bottom pivotally connected with the lower end of the said back, a U-shaped brace having its side arms pivotally connected with the sides of the said bottom, the middle portion of the said brace being adapted to engage the said notches, and a hook fixed on the car and adapted to be engaged by the said brace to hold the bottom in a folded position.

8. A car-fender provided with a basket comprising a back having side members provided with notches near the upper end, a bottom pivotally connected with the lower end of the said back, a U-shaped brace having its side arms pivotally connected with the sides of the said bottom, the middle portion of the said brace being adapted to engage the said notches, and hooks hinged on the said side arms and adapted to hook onto the middle portion of the said brace to lock the latter in place.

812,572. **SAFETY SYSTEM FOR RAILWAYS.** GEORGE LAURENSO, Visalia, Cal. Filed May 9, 1905. Serial No. 259,550.

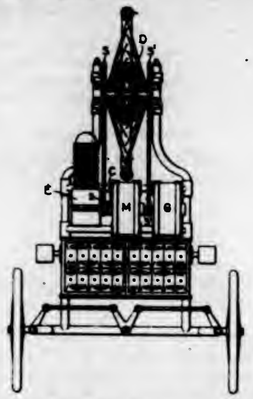
Claim.—1. The combination, in a safety system for railways, of a pivoted L-shaped crank, set up by the track, one at each end of a block or section of the road and turning on a pin through the angle of said crank and through brackets fastened to the railway-ties; a sprocket or pulley fastened to each crank and turning on said pin, each made to turn in opposite directions by a crossed continuous cable or like means with chain passing around said sprockets, or belt passing around and secured to said pulleys; a rigid pin on a locomotive or train to engage one arm of an L-shaped crank, and turn it down, so turning the other arm up, and by means of said cable turning the arms of the crank at the other end of the block or section, for the purpose of operating signals set up by the track, all substantially as set forth.

2. The combination, in a safety system for railways, of a pivoted L-shaped crank, set up by the track, one at each end of a block or section of the road and turning on a pin through the angle of said crank and through brackets fastened to the railway-ties; a sprocket or pulley fastened to each crank and turning on said pin, each made to turn in opposite directions by a crossed continuous cable or like means with chain passing around said sprockets, or belt passing around and secured to said pulleys; a pivoted extension to one arm of each crank, a spring or weight to hold said extension in line with the arm carrying it when said arm stands upright; a lever on a locomotive to engage said extension so that when said locomotive passes out of the block or section the said extension will yield and allow said lever to pass by unaffected, but should the locomotive enter the block or section when said block or section is not clear, the said extension, being rigid from the outside, will turn down the engaging lever on the locomotive, for the purpose of stopping a train when entering a block or section not clear, all substantially as described.

3. The combination, in a safety system for railways, of a pivoted L-shaped crank, set up by the track, one on each end of a trestle or bridge, and at a convenient distance therefrom, said crank turning on a pin through its angle and through brackets fastened to the railway-ties; a sprocket or pulley fastened to each crank and turning on said pin, each made to turn in opposite directions by a crossed continuous cable or like means with chain passing around said sprockets, or belt passing around and secured to said pulleys; a pivoted extension to one arm of each crank, a spring or weight to hold said extension in line with the arm carrying it when said arm stands upright; an incombustible weight or weights setting on or under said trestle or bridge, and hanging on said continuous cable, which is suitably supported; a lever on a locomotive to engage said extension, so that should the trestle or bridge be destroyed, as by wind or fire, the weight by falling would pull said cable and so raise said extension of each L-shaped crank, and should a locomotive enter the block or section of track when said extension is raised the said lever on the locomotive would be turned back for the purpose of stopping the train, substantially as set forth.

4. The combination, in a safety system for railways, of a pivoted arm or L-shaped crank, set up by the track at a convenient distance from a switch, and turning on a pin through brackets fastened to the railway-ties; a wedge in a suitable slot at the switch, a cable or like means connecting the lower end of said arm or crank with said wedge; a rigid arm on a locomotive or train to engage the upper end of said pivoted arm or crank, and turn it down, for the purpose of closing the switch, if said switch is left open, all substantially as set forth.

812,573. **AUTOMOBILE.** HERMANN LEMP, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed June 9, 1904. Serial No. 211,731.



Claim.—1. In combination, a prime mover, a differential gear, a dynamo-electric machine connected thereto through said gear, and a magnetic clutch in circuit with said machine and adapted to clutch said prime mover to said gear.

2. In combination, a prime mover, differential gearing connecting said prime mover to the load, dynamo-electric machines controlling said gearing, and a magnetic clutch in circuit with said machines and arranged when deenergized to disconnect said prime mover from said gearing.

3. In combination, a differential gear, a prime mover connected to one member thereof, a dynamo-electric machine connected to a second member thereof, a second dynamo-electric machine connected to said prime mover, and a magnetic clutch in circuit with said machines and arranged when deenergized to disconnect said prime mover from said differential gear.

4. In combination, a differential gear, a prime mover connected to one member thereof, a dynamo-electric machine connected to a second member thereof, a second dynamo-electric machine connected to the prime mover, and in circuit with the first machine, means for varying the relative field strengths of said machines, and a magnetic clutch in circuit with said machines and arranged when deenergized to disconnect said prime mover from said differential gear.

5. In a self-propelled vehicle, a differential gear, a driving-wheel of the vehicle connected to one member of said gear, a prime mover connected to a second member of said gear, a dynamo-electric machine connected to the third member of said gear, a second dynamo-electric machine connected to said prime mover, and a magnetic clutch in circuit with said machines and arranged when deenergized to disconnect said prime mover from said gear.

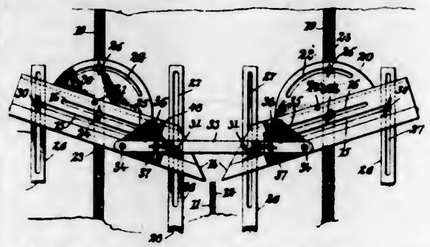
6. In combination, an internal-combustion engine, a vehicle to be driven thereby, electrically-controlled speed-changing gearing between said engine and the driving-wheels of said vehicle, and means for disconnecting said engine from said gearing at starting and for automatically connecting said engine to said gearing when the controlling-circuit of said gearing is closed after the engine is started.

7. In combination, an internal-combustion engine, a vehicle to be driven thereby, speed-changing gearing between said engine and the driving-wheels of said vehicle, dynamo-electric machines controlling said gearing, and a magnetic clutch in circuit with said machines and arranged when demergized to disconnect said engine from said gearing.

812,574. **SAW-GAGE.** JOHN S. LEETON, New York, N. Y. Filed Sept. 9, 1905. Serial No. 277,686.

Claim.—1. In a saw-gage, a body having an end beveled, a guide-bar adapted for sliding movement upon a saw-table, means for adjustably and pivotally connecting the body to said guide-bar, and guide-arms longitudinally and transversely adjustable upon the body.

2. In a saw-gage, a body-block substantially L-shaped in cross-section and beveled at one end, a guide-bar adjustably and pivotally connected with the base member of the body-block, guide-arms transversely and longitudinally adjustable upon the body-block, said guide-bar and guide-arms being located at the under surface of the body-block, and means for locking said guide-bar and guide-arms in adjusted position.



3. In a saw-gage, a body-bar, substantially L-shaped in cross-section, comprising an upright and a horizontal base member, a guide-bar pivotally and adjustably connected with the under face of the said body-block, guide-arms mounted for longitudinal and transverse adjustment on the under surface of the base member of the body-block, an adjusting member pivotally located at the working surface of the vertical member of the body-block, which member of the body-block is recessed to receive the said adjusting member, and means for moving the free end of the adjusting member to and from the body-block.

4. In a saw-gage, the combination with a substantially L-shaped body comprising a vertical member and a horizontal base member, a guide-bar pivotally and adjustably attached to the under portion of the base member of the body-block, guide-arms also located at the under face of the base member of the body-block, means for imparting transverse and longitudinal adjustment to the said guide-arms, an adjusting-arm hinged at one end to the end portion of a recess produced in the working face of the vertical member of the body-block, means for moving the free end of the said adjusting member outward and inward, and a slide mounted upon the said adjusting member.

5. In a saw-gage, two body-blocks of like construction, beveled at their inner ends, an adjustable connection between the beveled end portions of the body-blocks, each body-block being substantially L-shaped in cross-section and comprising a vertical and a horizontal base member, a guide-bar adjustably and pivotally connected with the base member of each body-block, guide-arms mounted upon the base member of each body-block, means for adjusting the said guide-arms longitudinally and transversely of the body-blocks, a hinged adjusting member located at the working face of the vertical member of each body-block, the said members of the said body-blocks being recessed to receive the said adjusting members, adjusting means for the adjusting members, and a slide for each adjusting member.

812,575. **CORN-HARVESTER.** DAVID T. LOWE, Pana, Ill. Filed May 4, 1905. Serial No. 258,849.

Claim.—1. In a corn-harvesting machine of the character described, the combination with the wheeled frame; the receiver R; the lower throats or stalk-passages and the cutter devices that operate over the lower throats or passages, said cutter devices being driven from the drive-wheels; of the upper throat or stalk-guides each including an outer downwardly and forwardly inclined side guide, and an inner inclined guide, the latter being mounted on the frame-platform and adjustable laterally to or from their opposing fixed guides and a means for moving the said adjustable side guides to or from the fixed guides in unison, whereby to increase or diminish the exit ends of the upper-throats or stalk-passages as set forth.

2. The combination in a corn-harvesting machine, of the wheeled supporting-frame which includes a front or platform section and rearwardly-projecting sides, a supporting-wheel journaled in each of the rearwardly-projecting sides, a receiver mounted on the frame between the wheels, consisting of swinging sides, bottom members hinged to the lower ends of the sides, cutter mechanism for severing the stalks, means for turning the cut stalks down into the receiver, the crank-lever 60, the eye A^4 on the platform and the hangers that pass through the eye A^4 connected at the upper end to the lever and at their lower ends with the two bottom sections of the receiver, as set forth.

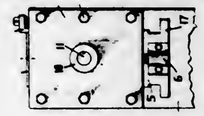
3. In a corn-harvesting machine, a wheel-supporting frame having a throat or guideway at each side; a cutter device operating over each of the said guideways or throats; a connection for each cutter device with its respective drive-wheel; a supporting means for the upper ends of the stalks, comprising a fixedly-held side guide, a sweep mounted in each of the fixedly-held side guides having fingers for engaging and turning the head ends of the stalks down through the exit ends of the stalk-passages, a receiver for said cut stalks the movable side guides and a means for adjusting the movable side guides for the stalk-passages operable from the driver's seat as set forth.

4. In a corn-harvesting machine of the character described; the combination with the wheeled frame, the receiver mounted between the wheels, a cutter device for each side and a means for guiding the stalks into engagement with the cutter devices; comprising the inclined guide members 9 and 9ª fixedly mounted on the frame, other side guides that coact with the guide members 9 and 9ª, said other guides being pivotally secured to the frame to swing toward and from their opposing guide members, a shaft journaled in each of the fixedly-held side guides geared with and driven by the cutter-actuating means, said shafts having each a crank member, a reciprocating finger or sweep-bar connected to said crank member having a guide portion slidable in a bearing in the fixedly-held member and a means for dumping the receiver as set forth.

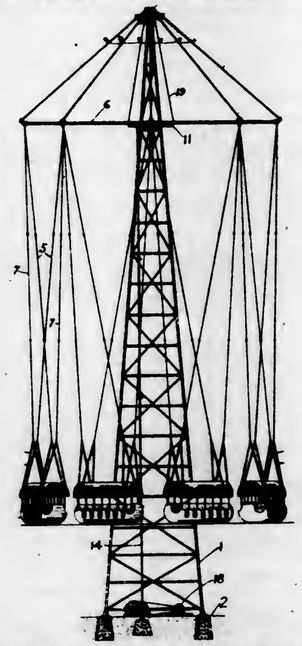
5. The combination with a wheeled supporting-frame, comprising a front platform and rearwardly-extended side portions, in each of which a drive-wheel is journaled, a receiver suspended between the said rearwardly-extending side portions of the frame, said receiver consisting of swinging side members, and bottom sections hinged to the lower ends of the side members and adapted to drop by gravity and to be closed up to a horizontal position, the cutter devices one at each side of the platform, means for guiding the stalks to the said cutter devices; the driver-seat, the bell-crank lever pivotally mounted adjacent the driver's seat, a pair of pendent rods secured to the inner end of the lever, an eyepiece on the frame through which the pendent rods pass, said pendent rods being secured to the opposite bottom pieces of the receiver, guides for leading the upper or head end of the cut stalks into the receiver, said guides including the bars 10 pivotally secured to the platform, telescopically connected with each other and the bow-spring 13 connected with the said lever 60, all being arranged substantially as shown and for the purposes specified.

812,576. **PUNCH OR SHEARS.** CHARLES B. MACBETH, Hamilton, Ohio, assignor to The Long & Allstatter Co., Hamilton, Ohio. Filed Oct. 23, 1905. Serial No. 284,694.

Claim.—In a punch or shear machine, the combination, substantially as set forth, of a body provided with jaws forming a ram-guide between them, a face-plate rigidly secured to the faces of the jaws and forming the front wall of the ram-guide and provided with a bearing, a cam-shaft crossing the ram-guide and journaled in said bearing and in a bearing in the body to the rear of the ram-guide, an eccentric upon the cam-shaft between the front and rear walls of the ram-guide, a ram fitting the ram-guide and having a rearwardly-open recess surrounding the eccentric and having a slot in the front wall of the recess where said wall is traversed by the cam-shaft, and a pitman disposed within said recess and loosely confined between the wall of the recess and the rear wall of the ram-guide and having articulate connection with the ram and eccentric.



812,577. **AMUSEMENT DEVICE.** PHILIP M. MALONEY, Philadelphia, Pa. Filed Sept. 26, 1904. Serial No. 226,881.



Claim.—1. In an amusement apparatus, cars or vehicles adapted to carry passengers, a rotatable frame, divergent suspension means for said cars comprising connections which extend from points above the ends of said cars slantwise to points adjacent the opposite ends of said cars, thereby crossing above said cars, connections extending directly from said points above said cars to points adjacent the ends of said cars directly below, and loops for said suspensions, a pair of loops being located at each end of the car and having their lower ends attached to the opposite sides and on the outside of said cars and having their upper ends attached to a pair of diverging suspensions.

2. In an amusement apparatus, a supporting-tower provided with a convex bearing-block at its apex, a rotatable frame having a convex bearing-block at its upper end, a double concave pivot-block interposed between the bearing-blocks of the tower and frame, and vehicles adapted to carry passengers suspended from said frame.

3. In an amusement apparatus, a supporting-tower, a rotatable frame suspended from the top of said tower, said rotatable frame comprising an upper member pivotally mounted on the upper end of said tower, radial arms attached to means adapted to engage the body of said tower to hold the frame in position laterally, supporting members extending from said upper member to the outer ends of said arms, and to said means for holding the frame against lateral move-

ment, and vehicles adapted to carry passengers suspended from said

ard, a pawl pivoted to the lever, a pawl pivoted to the standard, a

812,582. **CLOTHES LINE SUPPORT.** CHARLES F. MITCHELL and

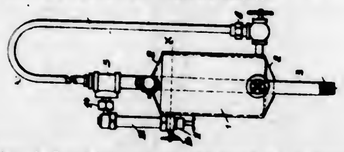
ment, and vehicles adapted to carry passengers suspended from said arm.

4. In an amusement apparatus, a supporting-tower, a rotatable frame suspended from the top of said tower, comprising an upper member pivotally mounted on the upper end of said tower, supports depending from said upper member, a guide-ring surrounding said tower, provided with arms, said supports being connected with said ring and said arms, vehicles adapted to carry passengers suspended from said arms, and a motor and a gearing between said motor and said ring for rotating said frame.

5. In an amusement apparatus, a supporting-tower, a rotatable frame suspended from the top of said tower, and comprising an upper member from which depend supporting-rods, a guide-ring having an interior rack surrounding said tower, antifriction devices upon said tower engaging a smooth portion of said ring, an outwardly-extending flange upon said ring, arms attached to said flange, said supporting-rods being attached to said arms and said flange, vehicles adapted to carry passengers suspended from said arm, and means for rotating said frame.

6. In an amusement apparatus, a supporting-tower, a rotatable frame suspended from the top of said tower, and comprising an upper member from which depend supports, a guide-ring having a rack surrounding said tower, a smooth track between said ring and said tower, antifriction devices also between said ring and said tower engaging said track, arms attached to said guide-ring, said supports being attached to said arms and said ring, vehicles adapted to carry passengers suspended from said arms, and means for rotating said frame.

812,578. LUBRICATOR. JOHN MALOY and ARCHIE WHITE, Dunbar, Pa. Filed Oct. 12, 1905. Serial No. 282,446.



Claim.—1. In a lubricator the combination of a cylindrical receptacle, a steam-pipe passing centrally through said receptacle, an inverted-U-shaped pipe connected to the upper end of said steam-pipe, one leg of said U-shaped pipe extending downwardly alongside said receptacle, a globe-valve connected to the lower end of said leg, said globe-valve being connected with said receptacle, a needle-valve carried by said receptacle, a sight-glass carried by the receptacle and provided with a drainage-passage, a valve-stem controlling said drainage-passage, said sight-glass being in communication with said U-shaped pipe above the upper end of said steam-pipe.

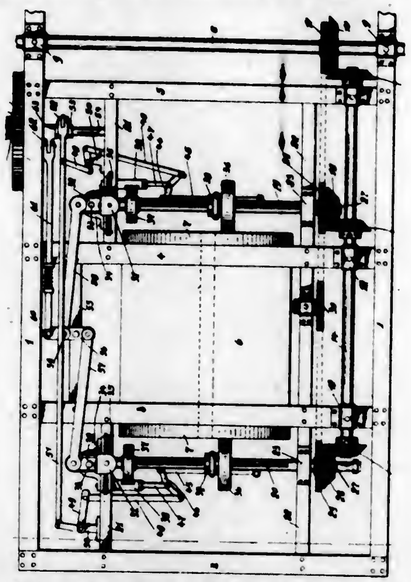
2. In a lubricator the combination with a cylindrical receptacle, of a steam-pipe passing centrally through said receptacle, said receptacle being provided with a radially-disposed enlargement on its bottom, said enlargement having a bore communicating with said steam-pipe and with the interior of the receptacle, a valve-stem adapted to control the passage through said bore, a pipe leading from the upper end of said steam-pipe to the lower end of the receptacle, a globe-valve on said pipe, a needle-valve mounted on the receptacle, and a sight-glass mounted on said receptacle and communicating with the last-named pipe.

3. In a sight-feed lubricator the combination with a receptacle and a pipe passing therethrough, of a U-shaped pipe connected to the first-named pipe above the top of the receptacle, one end of said U-shaped pipe extending downwardly to and communicating with the lower end of the receptacle, a needle-valve carried by the receptacle and a sight-glass mounted on said receptacle and communicating with said U-shaped pipe.

812,579. SPEED-REGULATING DEVICE. THOMAS L. MARSFIELD, Washington, Pa. Filed Jan. 23, 1905. Serial No. 242,054.

Claim.—1. In a device of the type set forth, the combination with a suitable frame, a shaft mounted in said frame, revoluble disks mounted on said shaft, rotatable pivotally-mounted shafts carried by said frame, wheels slidably mounted upon said last-named shafts, and adapted to engage said disks, means carried by said frame to adjust said wheels upon said shafts, and means carried by said frame and operable by said adjusting means to disengage said wheels from said disks, substantially as described.

2. In a device of the type described, the combination with a suitable frame, a shaft mounted on said frame, disks carried on the opposite ends of said shaft, of rotatable pivotally-mounted shafts carried by said frame, means carried by said last-named shafts to engage said disks, and impart a rotary motion to said shafts, means to adjust the first-named means and simultaneously disengage the first-named means from said disk, substantially as described.



3. In a device of the type described, the combination with a suitable frame, a shaft mounted in said frame and disks carried by said shaft, of rotatable shafts pivotally mounted upon said frame, wheels slidably mounted upon said last-named shafts and adapted to engage said disks, means to adjust said wheels upon said shafts, means to disengage said wheels from said disks, brake-wheels carried by said shafts and stationary brake-shoes adapted to coact with said brake-wheels and to retard the movement of said shafts when disengaged from said disks, substantially as described.

812,580. LIFTING-JACK. HUGH M. MARSH, Chicago, Ill. Filed Oct. 4, 1905. Serial No. 281,306.

Claim.—1. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a ratchet-bar in sliding engagement with the standard, a pawl pivoted to the lever, a pawl pivoted to the standard, a spring connecting the pawls, and means carried by one of the named movable parts for shifting the spring.

2. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a ratchet-bar in sliding engagement with the standard, a pawl pivoted to the lever, a pawl pivoted to the standard, a spring having one end attached to each pawl, and means for shifting the point of attachment of the spring on one of the pawls.

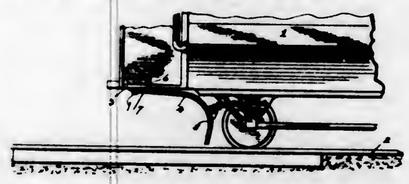
3. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a ratchet-bar in sliding engagement with the standard, a pawl pivoted to the lever, a pawl pivoted to the standard, a pivot-block in sliding engagement with one of the pawls, a spring pivotally attached to the block and to the other pawl, and means for securing the block in an adjusted position on the pawl.

4. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a ratchet-bar in sliding engagement with the standard, a pawl pivoted to the lever, a pawl pivoted to the standard, a pivot-block in sliding engagement with the last-named pawl, a spring pivotally attached to the block and to the other pawl, and means for securing the block in an adjusted position on the pawl.

5. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a ratchet-bar in sliding engagement with the standard, a pawl pivoted to the lever, a pawl pivoted to the standard, a pivot-block in sliding engagement with one of the pawls, a turn-button pivoted to the pawl, a link connecting the turn-button and the block, and a spring pivotally attached to the block and to the other pawl.

6. In a lifting-jack, in combination, a standard, a ratchet reciprocating in the standard, a pair of pawls, a lever carrying one of the pawls, and a spring reacting between the two pawls and arranged to reverse its action as the lever approaches the limits of its movement.

812,581. SWITCH-THROWING MECHANISM. HENRY O. MARQUIS, Superior, Pa. Filed Nov. 21, 1905. Serial No. 288,431.



Claim.—1. In a switch-throwing device, the combination with a car, a track, a switch-tongue, and a spring-retained hook-shaped bar carried by said car and actuated by the operator of said car, of a casing mounted in said track and having recesses formed in its upper face, eccentrics mounted within said casing adjacent to said recesses and adapted to protrude therein, a block pivotally mounted in said casing and connected with said switch-tongue, means actuated by the bar of said car to move said switch-tongue, substantially as described.

2. The combination with a car, a track and a switch-tongue, of a spring-held hook-shaped bar carried by said car and actuated by the operator thereof, a casing mounted in said track and having recesses formed therein, eccentrics mounted in said casing and protruding into said recesses, a block pivotally mounted in said casing and connected to said switch-tongue and links connecting the opposite ends of said block with said eccentrics, said block being actuated by said bar contacting with said eccentrics to move said switch-tongue, substantially as described.

812,582. PAINT-REMOVER. GUSTAVUS MICHAELIS, Albany, N. Y. Filed Apr. 26, 1905. Serial No. 257,260.

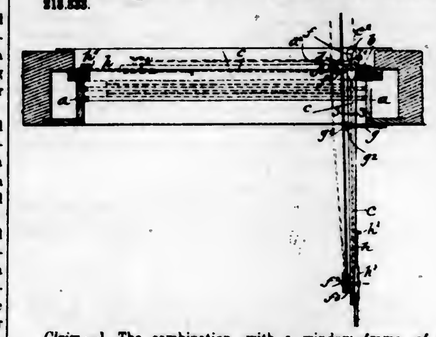
Claim.—1. A composition for removing varnish and paint, comprising benzol; a monohydric alcohol; and a water and alcohol soluble soap dissolved with the aid of heat, substantially as described.

2. A composition for removing paint and varnish having for dissolving agents a hydrocarbon and a monohydric alcohol, with a water and alcohol soluble soap dissolved therein, substantially as described.

3. A composition for removing paint and varnish, consisting of a hydrocarbon and an alcohol, of at least 97° strength: and a water and alcohol soluble soap dissolved therein with the aid of heat, substantially as described.

4. A composition for removing paint and varnish, consisting of a water and alcohol soluble soap; and dissolving agents, consisting of a hydrocarbon and ordinary alcohol of at least 97° strength, substantially as described.

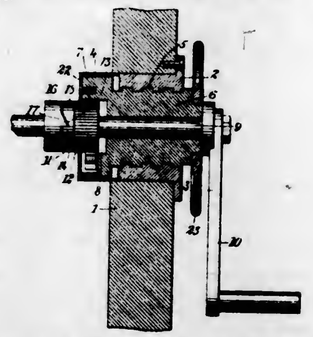
812,583. CLOTHES-LINE SUPPORT. CHARLES F. MEYERS and FRANK J. MACH, New York, N. Y. Filed July 30, 1904. Serial No. 218,338.



Claim.—1. The combination, with a window-frame, of a bracket attached to one side thereof and provided with a stop, a supporting-arm pivoted horizontally to said bracket and provided at its outer end portion with a guiding means, and a guide-arm also pivoted to said bracket and abutting against said supporting-arm so as to swing therewith, said guide-arm being adapted to abut against said stop.

2. The combination, with a window-frame provided at one side with a suitable keeper, of an arm pivoted to the opposite side of said frame, a guide-pulley at the outer end portion of said arm, means in proximity to the pivot of said arm coöperating with said pulley, and an extensible slide-piece provided with a slot engaging the shaft of said guide-pulley, said slide-piece being adapted to engage said keeper.

812,584. STARTING MECHANISM FOR GAS-ENGINES. VERNON B. MILLER, Philadelphia, Pa. Filed Feb. 28, 1905. Serial No. 247,671.



Claim.—1. In a starting mechanism of the class described, in combination, a crank-spindle, a starting-spindle adapted to engage the same, a sleeve in which said starting-spindle is rotatably mounted, said sleeve having a thread of high pitch, a one-way clutch connection between said starting-spindle and said sleeve, and a member having a threaded bore receiving said sleeve.

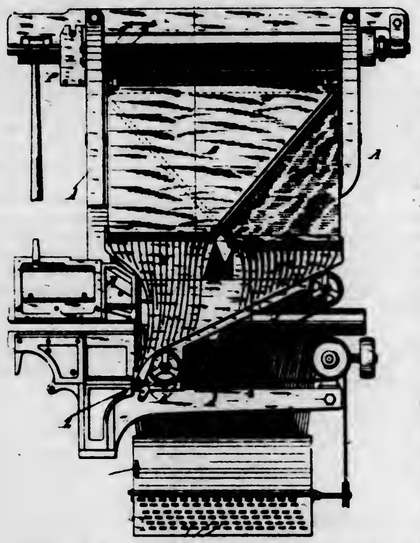
2. In a starting mechanism of the class described, in combination, a crank-spindle having a collar with teeth, a starting-spindle, a ratchet-wheel carried thereby and also having recesses coöperating with said teeth, a sleeve in which said starting-spindle is rotatably mounted, and pawls carried by said sleeve and engaging said ratchet-wheel, said sleeve having a thread and a threaded bush receiving said sleeve.

3. In a starting mechanism of the class described, in combination, a member presenting a threaded bore, a sleeve having a thread engaging the same and rotatably mounted in said bore, said sleeve having a recess in the inner extremity thereof, a starting-spindle rotatably mounted in said sleeve, a ratchet-wheel rigidly carried by said starting-spindle and normally lying in said recess, pawls carried by said sleeve and engaging the teeth of said ratchet-wheel, a hand-wheel attached to said sleeve for adjusting the same, a crank-

spindle, and means carried by said crank-spindle for engaging said ratchet-wheel.

4. In a starting mechanism of the class described, in combination, a sleeve having an external thread and a bore, a starting-spindle rotatably mounted in said bore and adapted to slide longitudinally therein, a ratchet-wheel attached to said starting-spindle, said sleeve having a plurality of pockets disposed circumferentially about said ratchet-wheel, a plurality of pawls carried respectively in said pockets and engaging said ratchet-wheel, a crank-spindle aligning with said starting-spindle, a head carried by said crank-spindle, said head and said ratchet-wheel having means for engagement, and a threaded bush receiving said sleeve.

812,585. **TYPOGRAPHIC MACHINE.** CARL MUHLEISEN, Berlin, Germany, assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Oct. 30, 1905. Serial No. 285,608.



Claim.—1. In a typographic machine, two magazines overlapped at the receiving end and diverging toward the delivery end, substantially as shown and described.

2. In a typographic machine, two trapezoidal magazines, having their receiving ends overlapped and their delivery ends separated laterally, substantially as shown.

3. In a typographic machine, two magazines, overlapped at the receiving end but laterally separated at the delivery end, in combination with a single mechanism for assembling the matrices from the two magazines.

4. The two trapezoidal magazines, overlapped at the receiving end and laterally separated at the delivery end, in combination with two series of receiving-channels and a common assembling mechanism.

5. In combination with the two parallel distributers, the two magazines having wide upper ends in receiving relation to the respective distributers, and contracted lower ends deflected respectively to the right and left.

6. In a typographic machine, the combination of the following elements: two magazines having overlapped receiving ends of equal width and delivery ends separated laterally, a single assembling mechanism receiving the matrices from both magazines, parallel distributers overlying the respective magazines, and a single feed mechanism delivering matrices to the respective distributers.

7. In a typographic machine and in combination with two magazines, having overlapped upper ends of equal width and contracted lower ends laterally separated, escapement devices at the ends of the magazines, a centrally-located keyboard, and tension-wires deflected right and left from the escapements of the respective magazines to the keyboard.

8. In combination with the magazine and its escapements, tension-wires extending downward from the escapements, levers and springs connected with said wires and maintaining the same under tension, a keyboard mechanism acting to relieve the wires from tension, and springs acting to reverse the position of the escapements when the wires are relieved.

9. The rocking escapements, the spring acting thereon, the levers engaging the escapements, the tension-wires extending thence downward, the spring-actuated levers at the lower ends of the wires, and keyboard mechanism acting upon said levers.

10. In a typographic machine, two magazines having their lower ends laterally separated and arranged at different levels, escapements at their ends, a single centrally-located keyboard, laterally-deflected connections extending from the respective escapements to the keyboard, and a shifting connection whereby the keyboard may be caused to operate the connections for one magazine or the other, at will.

11. In a typographic machine, the combination of two parallel distributers, means for delivering the line of matrices directly to one distributer, and means for moving the individual matrices belonging to the second distributer, edgewise thereto.

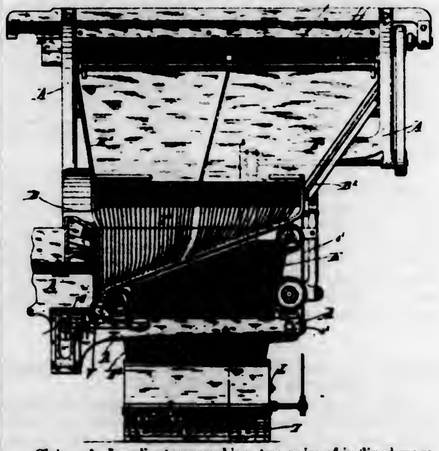
12. In combination with the distributer-bar N, and means for urging the composed lines of matrices directly toward the same, the second and parallel distributer N', and a laterally-acting carrier, whereby matrices belonging to the second distributer are carried edgewise thereto away from the matrices proceeding to the first distributer.

13. In a linotype-machine, the combination of two distributers, means for presenting a composed line of matrices, and a rotary carrier for delivering matrices edgewise, one at a time to the second distributer.

14. In a linotype-machine, matrices of two forms, two distributers, means for presenting a composed line of matrices, and a carrier-belt arranged to deliver matrices of one form to the second distributer and permitting those of the other form to pass to the first distributer.

15. In a linotype-machine and in combination with the distributer, an endless belt traveling in a vertical plane and adapted to carry the matrices edgewise successively toward the distributer.

812,586. **LINOTYPE-MACHINE.** CARL MUHLEISEN, Berlin, Germany, assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Oct. 30, 1905. Serial No. 285,609.



Claim.—1. In a linotype-machine, two pairs of inclined magazines, arranged side by side, each pair comprising an upper and a lower magazine, in combination with a series of escapements for each magazine, a single keyboard and means whereby the keyboard may be connected at will with the escapements of either pair of magazines, and means for preventing at will the delivery of matrices from either magazine of said pair.

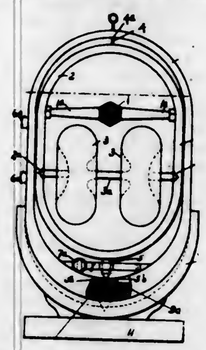
2. In combination, two lower magazines arranged side by side, two upper magazines thereover, means for locking the escapements of the upper or the lower magazines at will, a single keyboard and means substantially as shown for connecting the keyboard at will with the escapements of the two left-hand magazines or with the escapements of the two right-hand magazines, whereby the matrices may be delivered from any one of the magazines at will.

3. In combination with two upper magazines and two lower magazines, each provided with a series of escapements, the connected devices for locking the upper and lower escapements respectively, a single keyboard mechanism, reeds extending thence right and left to the respective magazines, and shifting connections whereby the keyboard may be caused to actuate one set of reeds or the other.

4. In a linotype-machine, two magazines arranged side by side, and two overlying magazines arranged in like manner, a single assembler-belt and a series of channels T, constructed and arranged to deliver matrices from all the magazines to the one belt.

5. In a linotype-machine, two pairs of inclined magazines, arranged side by side, in combination with a single keyboard, means coöperating with the keyboard to cause the discharge of matrices from any one of the magazines at will, and means to prevent the discharge of matrices from the other magazines.

812,587. **MERIDIAN-TRANSFER APPARATUS.** GEORGE C. McFARLANE, Bay City, Mich. Filed Oct. 17, 1903. Serial No. 177,504.



Claim.—1. In a device of the class described a pivotally-mounted sighting device, and a revolving disk operating in conjunction with said sighting device, said disk being adapted by its inertia to preserve parallelism of the sighting device the axes of the sighting device and of the disk being parallel.

2. The combination with a support, of a frame pivotally mounted on the support to rotate freely upon an axis normally perpendicular to the horizon, a sighting device pivotally mounted in said frame, a rotatable disk also mounted in said frame, the disk adapted by reason of its inertia to preserve the parallelism of the sighting device.

3. A frame revolubly mounted on vertical pivots only, a telescope carried by said frame and having its axis in a line intersected by the line of said pivots, and a disk revolubly mounted in said frame the axes of the disk and telescope being parallel.

4. The combination with an outer stationary frame, of an inner frame, a sighting device and a movable inertia member pivotally mounted in said inner frame, a pivot-support directly connecting the inner and outer frames and permitting movement of the inner frame only in a vertical plane and means for locking the frames together against relative movement.

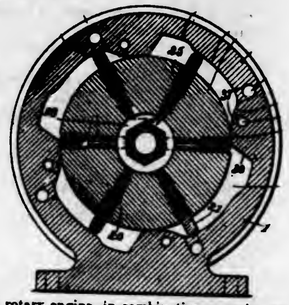
5. The combination in a meridian-transferring mechanism provided with a pivotally-supported member, of means for counteracting the rotative tendency of the member, comprising a movable bearing on which the pivoted member is supported and means for imparting oscillatory movement to the bearing.

6. The combination in a device of the character set forth, of a pivoted member, rotary means carried by the member and tending to rotate the latter, a movable bearing in which the pivoted member is supported and means for constantly and automatically imparting an oscillatory movement to the bearing.

7. The combination in a device of the character set forth, with a pivoted member and movable means tending to rotate the member, of means for counteracting said tendency, comprising a movable bearing on which the member is pivotally supported, the bearing provided with a slot, an eccentric crank received in the slot, and means for imparting rotary movement to the crank.

812,588. **ROTARY ENGINE.** ROBERT C. McLEAN, Cleveland, Ohio. Filed Sept. 29, 1905. Serial No. 280,668.

Claim.—1. In a rotary engine, in combination, a casing presenting a substantially cylindrical body, a drum rotatably mounted within said body, a plurality of pistons projecting radially from said drum and normally engaging the inner face of said body, said body having abutments projecting inwardly and substantially abutting the cylindrical face of said drum, said casing further having exhaust-ports near said abutments, said abutments presenting inclined forward faces along which said pistons pass and auxiliary ports in said inclined faces.



2. In a rotary engine, in combination, a casing presenting a substantially cylindrical body, a drum rotatably mounted within said body, said casing having a plurality of abutments projecting toward said drum and substantially abutting the outer surface thereof whereby a plurality of expansion-chambers are formed between said abutments, said abutments having inclined faces disposed forwardly with respect to the direction of rotation of said drum, means for admitting steam to the interior of said drum, said drum having steam-spaces, a plurality of pistons guided in said drum and backed by said steam-spaces whereby the steam operates to maintain said pistons in engagement with the said casing, said casing having exhaust-ports adjacent to said abutments adapted to be uncovered by the advance movement of said pistons, and further having auxiliary exhaust-ports opening on said inclined faces, said auxiliary exhaust-ports affording escape for steam held before said pistons after passing said first exhaust-ports.

812,589. **TARGET.** THOMAS J. McNELLY, New York, N. Y. Filed Aug. 25, 1905. Serial No. 275,766.

Claim.—1. In a target the combination of a main casing having an opening therein, a movable bull's-eye mounted behind said opening, a spring connected with the casing and supporting said bull's-eye, said spring being provided with a hook, a guideway on the casing, a slide mounted to reciprocate in said guideway and having a hook adapted to engage the first-mentioned hook, said slide having a guard located adjacent to the hook and slide, an indicator mounted on the slide, a spring secured to the casing and engaging said guard, said spring normally tending to force the indicator into an exposed position, the last-named spring also being provided with a bell-clapper and a bell mounted on the casing in the path of the movement of said clapper.

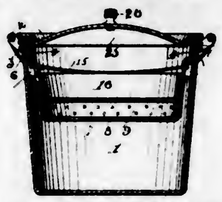
2. In a target, the combination of a target-casing having a central opening therein, a bull's-eye in said opening, a spring secured to the rear side of the target-casing and also secured to said bull's-eye, whereby the bull's-eye is adapted to yield when hit, a hook connected with said spring, a guideway on the casing, a slide reciprocably mounted in said guideway and having a hook provided with a straight rear surface adapted to engage the first-mentioned hook, a guard on said slide, an indicator also mounted on the slide, a spring for moving the slide secured to the casing and engaging said guard on the slide, said spring also having a bell-clapper, and a bell mounted in the path of movement of said clapper.

3. In a target, the combination of a movable bull's-eye, a registering device, means connected with the bull's-eye for operating the registering device, a roll of paper mounted upon the main target, said paper having a plurality of targets thereon, a straight edge movably mounted on the target-case, and resilient means for holding the straight edge against the targets.

4. A target having means for holding a roll of paper thereon, resilient means for securing said paper to the face of the target, and a carbon-paper mounted between the face of the target and the paper.

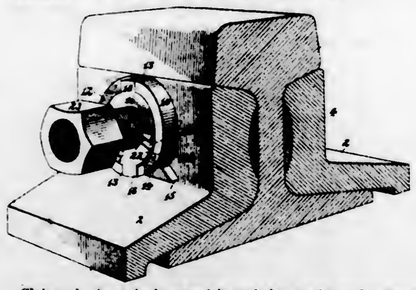
5. A target having a main casing, means for holding a roll of paper, a bar having a straight edge pivotally mounted upon the casing, and a spring engaging said bar and holding it in close contact with the front surface of the casing.

812,590. CULINARY VESSEL. AUGUST W. OBERMANN, Newcastle, Pa. Filed May 17, 1904. Serial No. 208,336.



Claim.—The combination of a receptacle having brackets upon its inner sides, a steamer provided with a flange having yokes thereon, a boiler having a flange with recesses for the reception of said yokes and a cover for the receptacle.

812,591. NUT-LOCK. MATHEW OMALIA, Scranton, Pa., assignor of one-fifth to John F. Durkan, one-fifth to Martin B. Casey, and one-fifth to A. J. Casey and P. J. Casey, copartners trading as Casey Bros., Scranton, Pa. Filed Sept. 13, 1905. Serial No. 278,258.



Claim.—1. A nut-lock comprising a bolt, a main washer thereon adapted for contact with a part of the structure to be bolted, and having means for preventing the same from turning about the bolt in either direction, a supplementary washer also on the bolt, and a nut, the two said washers having reverse engagement with each other on opposite sides of both a vertical plane and a horizontal plane passing through the axis of the bolt, and said supplementary washer having a spring member formed with a chisel edge for engaging with the nut.

2. A nut-lock, comprising a bolt, a nut, a main washer having means for preventing it from turning on the bolt, and provided with oppositely-arranged inclines forming shoulders, and a supplementary washer provided with lugs engaging the shoulders of the main washer and with an outwardly-projecting spring member having a chisel edge for engaging the nut.

3. A nut-lock comprising a bolt, a main washer thereon adapted for contact with a part of the structure to be bolted, and having means for preventing the same from turning about the bolt in either direction, a split supplementary washer also on the bolt, and a nut, the two said washers having reverse engagement with each other on opposite sides of both a vertical plane and a horizontal plane passing through the axis of the bolt, and said supplementary washer having a terminal thereof sprung outwardly and formed with a chisel edge for engaging with the nut on reverse turning thereof.

4. A nut-lock comprising a bolt, a main washer thereon adapted for contact with a part of the structure to be bolted, and having a straight lower edge and lateral extensions for preventing the same from turning about the bolt in either direction, a split supplementary washer also on the bolt, and a nut, the two said washers having reverse engagement with each other on opposite sides of both a vertical plane and a horizontal plane passing through the axis of the bolt and said supplementary washer having a terminal thereof sprung outwardly and formed with a chisel edge for engaging with the nut on reverse turning of the latter.

5. A nut-lock comprising a bolt, a main washer thereon adapted for contact with a part of the structure to be bolted, and having means for preventing the same from turning about the bolt in either direction, a split supplementary washer also on the bolt, and a nut, the said main washer having reversely-disposed inclined planes on its outer face, forming shoulders located on opposite sides of both a vertical plane and a horizontal plane passing through the axis of the bolt, and said supplementary washer having diametrically-disposed projections engaging with said shoulders, and also having means for engaging with the nut on reverse turning of the latter.

6. A nut-lock comprising a bolt, a main washer thereon adapted for contact with a part of the structure to be bolted, and having means for preventing the same from turning about the bolt in either direction, a split supplementary washer also on the bolt, and a nut, the said main washer having reversely-disposed inclined planes on its outer face, forming shoulders located on opposite sides of both a vertical plane and a horizontal plane passing through the axis of the bolt, and said supplementary washer having a terminal thereof sprung outwardly and formed with a chisel edge for engaging with the nut on reverse turning of the latter.

812,592. CHURN. WILLIAM L. POOL, Aztec, N. Mex. Filed June 30, 1904. Serial No. 213,211.

Claim.—A rotary churn-dasher including two sets of dasher-blades, the members of each set being in substantial parallelism at an angle to the path of rotation different from the angular disposition of the other set of blades, the space between each set of blades and the axis of rotation being unobstructed.

812,593. PROCESS FOR TARRING ROADS. LOUIS PRAUBERT and GASTON A. THURÉ, Nantes, France. Filed May 5, 1905. Serial No. 259,033.

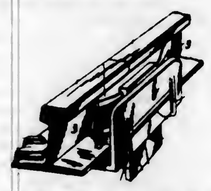
Claim.—1. The process herein described of making a product adapted for use for tarring or asphalting roads and public or private thoroughfares, the said process consisting in making a solution of casein in water in the presence of an alkali, adding thereto bitumen, asphalt, tar or other bituminous body previously softened by heat, and diluting the mixture with an appropriate quantity of water.

2. The new product herein described for tarring roads composed of a mixture of a solution of casein in water, and a bituminous body liquefied by heat.

3. The new product herein described for tarring roads composed of a mixture of a solution of casein in water in presence of an alkali, a bituminous body liquefied by heat, and water.

4. The new product herein described for tarring roads composed of a mixture of a solution of casein in alkaline water, a bituminous body liquefied by heat, a fatty substance, and water.

812,594. RAIL-JOINT. CHARLES M. RHODES, Steubenville, Ohio. Filed May 4, 1905. Serial No. 258,818.



Claim.—1. The combination with two rail-sections adapted to be joined together, of a base-plate, said base-plate having an overlying flange, an angularly-disposed wall carried by one edge of said base-plate, said base-plate having a slot formed therein adjacent to said wall, lugs carried by said base-plate and adapted to engage the bases of said rails, a fish-bar interposed between the web portions of said rails and said angularly-disposed wall, a wedging member mounted between said fish-bar and said wall, the lower end of said member having a plurality of apertures formed therein, and a split key adapted to be inserted in one of said apertures, substantially as described.

2. The combination with two rail-sections, of a base-plate adapted to support said rails, an angularly-disposed wall carried by said base-plate, a fish-bar interposed between the web portions of said rail and said wall, a wedging member mounted between said fish-bar and said wall, the lower end of said wedging member extending beneath said base-plate and having a plurality of apertures formed therein, means to retain the one edge of said base-plate in engagement with the bases of said rails, and means to retain said wedging member in engagement with said bar and said wall, substantially as described.

3. In a rail-joint, a rail-chair comprising a base-plate, having one end bent upward and inwardly to form an overlying flange extending in a plane parallel with the base-plate, a wall carried by the opposite side edge of said base-plate and extending upwardly therefrom at an acute angle, a fish-bar adapted to be placed between the rails received in said chair and said angularly-disposed wall, and having a recessed outer face, and a wedge-plate fitting in said recessed outer face and extending through an opening provided therefor in the base-plate, substantially as described.

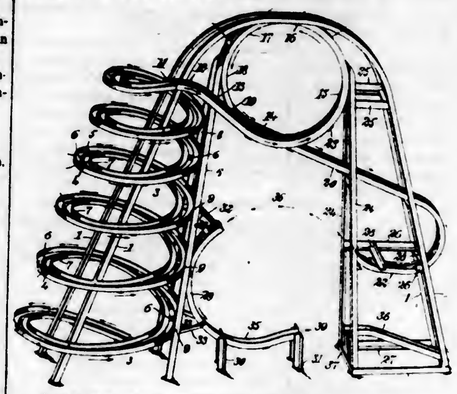
4. In a rail-joint, the combination with the chair receiving the rails, and having an angularly-disposed wall along one side edge, of a fish-bar engaging the rail-webs and fitting between the tread and base of said rail and having a recessed outer face, and a wedge-bar fitting in said recessed face between the fish-bar and the angularly-disposed wall and extending through an opening in the base of said chair substantially as described.

812,595. AMUSEMENT APPARATUS. OTIS ROBERTS, Winfield, Kans. Filed Nov. 1, 1905. Serial No. 285,473.

Claim.—1. An amusement apparatus, comprising an ascending spiral section of trackway for a vehicle, and a descending section of trackway merging therewith at the upper end thereof, the descending section being provided with a rise adjacent to its junction with the spiral section.

2. An amusement apparatus, comprising an ascending spiral section of trackway for a vehicle, and a descending section of trackway merging therewith at the upper end thereof, each section referred to having side guards for the wheel of the vehicle, the descending section being provided with a rise adjacent to its junction with the spiral section.

3. An amusement apparatus, comprising duplicate arched frame members, an ascending spiral section of trackway for a vehicle, disposed about upwardly-diposed portions of said frame, and a descending section of trackway merging with the said first-named section at the upper end thereof.

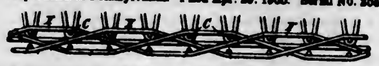


4. An amusement apparatus, comprising an ascending section of trackway for a vehicle, a descending section of trackway having a rise merging therewith, at the upper end thereof, an ascending semicircular section into which the lower end of the descending section merges, and a descending semicircular section merging at its upper end, into the corresponding end of said ascending semicircular section.

5. An amusement apparatus, comprising an ascending section of trackway for a vehicle, a descending section of trackway having a rise merging with said spiral section at the upper end thereof, an ascending semicircular section into which the lower end of the descending section merges, a descending semicircular section merging at its upper end into the corresponding end of said ascending semicircular section, a downwardly-inclined section leading from the lower end of the descending semicircular section, and terminating in a down curve and a return-section, a receiving-section between the upper end of which and said return-section there is a gap, and a final downwardly-inclined section disposed beyond the lower end of said receiving-section to provide another gap.

6. An amusement apparatus, comprising an ascending section of trackway for a vehicle, a descending section of trackway having a rise merging with said spiral section at the upper end thereof, an ascending semicircular section into which the lower end of the descending section merges, a descending semicircular section merging at its upper end into the corresponding end of said ascending semicircular section, a downwardly-inclined section leading from the lower end of the descending semicircular section, and terminating in a down curve and a return-section, a receiving-section between the upper end of which and said return-section there is a gap, and a final downwardly-inclined section disposed beyond the lower end of said receiving-section to provide another gap, all the sections referred to, excepting the spiral section, the receiving-section and final section; being constructed with rails for the side wheels of the vehicle, and with guard-rails for supporting the auxiliary wheels on the vehicle, in the inverted position of the latter, said first-named rails also having outer guards.

812,596. WOVEN PILE FABRIC. ANDREW G. ROBERTSON, Philadelphia, Pa., assignor to Thomas L. Leedom Company, Bristol, Pa., a Corporation of Pennsylvania. Filed Apr. 29, 1905. Serial No. 258,080.



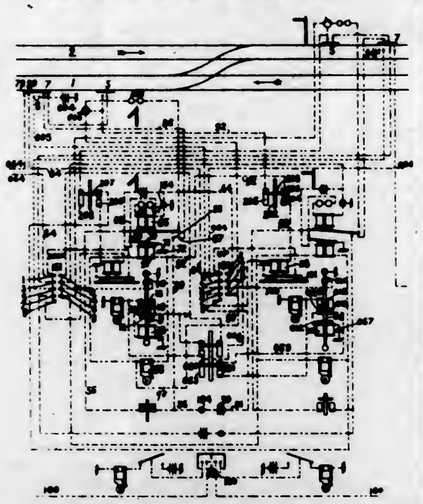
Claim.—1. In a woven pile fabric the combination of upper and lower filling-threads, pile-threads, a binder warp-thread passing over a pair of said upper filling-threads, a second binder warp-thread passing over the next succeeding pair of upper filling-threads and a third binder warp-thread passing over the next succeeding pair of filling-threads and said binder warp-threads then passing under successive pairs of said lower filling-threads, substantially as described.

2. In a woven pile fabric the combination of upper and lower filling-threads, pile-threads, binder warp-threads, one of said binder warp-threads adapted to pass over a pair of said upper filling-threads, two others of said binder warp-threads adapted to cross below the

said pair of upper filling-threads and engage the lower filling-threads and said binder warp-threads alternately engaging successive upper and lower pairs of filling-threads in like manner throughout the fabric, substantially as described.

3. In a woven pile fabric the combination of upper and lower filling-threads, pile-threads, binder warp-threads passing over successive pairs of upper filling-threads and under successive pairs of lower filling-threads, said binder warp-threads so arranged as to form a flat surface over a pair of upper filling-threads and to cross directly opposite said flat surface on the other side of said fabric, said binder warp-threads then engaging successive pairs of upper and lower filling-threads in like manner throughout the fabric, substantially as described.

812,597. **RAILWAY-TRAFFIC-CONTROL SYSTEM.** WILLIAM ROWE, Marrickville, near Sydney, New South Wales, Australia, assignor to Rowe's Patent Lock and Block Limited, Sydney, New South Wales, Australia. Filed Feb. 23, 1905. Serial No. 246,575.



Claim.—1. In positive lock-and-block railway-control systems the prevention of the cutting out or exclusion of an intermediate cabin and its block-instrument and signal connections and the prevention of the cutting in or inclusion of the same until the rear block-section of said cabin is clear of vehicles and conflicting points and the like substantially as described.

2. In positive lock-and-block railway-control systems the operation of the electrically-controlled outdoor semaphore-signal when electrically cut out by means of supplementary mechanical devices from any desired point as and for the purposes set forth substantially as described.

3. In positive lock-and-block railway-control systems the prevention of the concurrent working of the outdoor semaphore-signal by devices connected to the intermediate or excludable cabin and by supplementary mechanical devices at any desired point as and for the purposes set forth substantially as described.

4. In positive lock-and-block railway-control systems the prevention of the manipulation of the cutting-out or switching-in devices of the block instrument in an intermediate or excludable cabin while in the block-sections of such cabin conflicting points are set or outdoor signals indicate the line as foul as and for the purposes set forth substantially as described.

5. In positive lock-and-block railway-control systems the prevention of the transmission by the block instrument of a message "line clear" until all points and signals within the block-section are in normal safety position as and for the purposes set forth substantially as described.

6. In positive lock-and-block railway-control systems the prevention of the manipulation of the operative devices of points and outdoor signals of a block-section after the transmission of "line clear" to the rear cabin until the train has arrived at a protecting-signal as and for the purposes set forth substantially as described.

7. In positive lock-and-block railway-control systems the combination with the block instrument of switching through-contacts having a key-lock and a check-bar operated (as also the said switching through-contacts) by the key of said lock and adapted to hold and retain the slide-bar of said block instrument against manipulation while said block instrument is cut out of the system in the uniting of two block-sections into one continuous section as and for the purposes set forth substantially as herein described and explained.

8. In positive lock-and-block railway-control systems the combination with a block instrument having an electromechanical lock and switching through-contacts of a check-bar adapted to engage the slide-bar of said instrument and operative only when said slide-bar is released by its electromechanical lock and when the train has passed out of the section as and for the purposes set forth substantially as herein described and explained.

9. In positive lock-and-block railway-control systems the combination with a block instrument having an electromechanical lock and switching through-contacts of a check-bar adapted to engage the slide-bar of said instrument and having an electromechanical lock thereon adapted to prevent its withdrawal from its retaining position on the slide-bar of the block instrument until the closing of an electric circuit by a train on the permanent way and by a mechanically-operative switch in the cabin as and for the purposes set forth substantially as herein described and explained.

10. In positive lock-and-block railway-control systems the combination with the block instrument having an electromechanical lock and switching through-contacts with a key-lock and a check-bar adapted to cross the slide-bar a rail-contact protecting points in the block-section a supplementary electromechanical lock on the slide-bar of the instrument (preferably bifurcated for the purpose) with the electromagnet of said supplementary lock in a battery-circuit including said rail-contact (normally open) a check-bar or retaining-bolt under the armature-catch of said supplementary electromechanical lock, a locking-pin for the operative devices of said points and a handle or device for concurrently operating said last-mentioned check-bar of the supplementary electromechanical lock arresting said other check-bar of the key-lock and releasing said locking-pin as and for the purposes set forth substantially as herein described and explained.

11. In positive lock-and-block railway-control systems the combination with operating devices of a key-lock of a key non-withdrawable except when the block instrument is cut out or excluded from the system and adapted to operate the key-lock of manually-operative devices or an outdoor semaphore-signal and to be non-withdrawable from said latter key-lock unless said devices are locked in normal danger position as and for the purposes set forth substantially as herein described and explained.

12. In positive lock-and-block railway systems the combination with the slide-bar of a block instrument and revolving switching through-contacts having a rack 103 and a pinion 104 of a check-bolt 101 adapted to take across a stop on said slide-bar and to be prevented from so taking across until an armature-catch on said slide-bar is lifted on the joining up of an electric circuit substantially as herein described and explained and as illustrated in the drawings.

13. In positive lock-and-block railway systems the combination with the slide-bar of a block instrument and revolving switching through-contacts whose movement actuated a check-bolt 101 and said check-bolt of a stop 111 a permanent magnet 112 an electric magnet 113 and an armature-catch 114 substantially as herein described and explained and as illustrated in the drawings.

14. In positive lock-and-block railway systems the combination and arrangement with the slide-bar of a block instrument and revolving switching through-contacts actuating a check-bar 101 of a supplemental or divisional slide-bar 121 an electromagnet 120 a stop 123 and an armature-catch 124 substantially as herein described and explained and as illustrated in the drawings.

15. In positive lock-and-block railway systems the combination and arrangement of a block instrument one limb having check-bars 101 of additional or supplemental check-bolts 125 and 126 a locking-pin 127 and draw-bars and operating-levers and mechanism of points substantially as herein described and explained and as illustrated in the drawings.

16. In positive lock-and-block railway systems the combination with the slide-bar of the block instrument and rail-contacts as set forth of an outdoor signal-semaphore having levers 142, 143 and 144 a flange or lip on one of them 145 a connecting-rod 140 having an elongated eye 141 and hauling-cords, reverser-magnet and arm substantially as herein described and explained and as illustrated in the drawings.

812,598. **PROCESS OF CHLORINATING INDIGO.** ALBRECHT SCHMIDT and ERICH KNOWLES, Höchst-on-the-Main, Germany, assignors to Farbwerke vorm. Meister Lucius & Brüning, Höchst-on-the-Main, Germany, a Corporation of Germany. Filed Feb. 26, 1905. Serial No. 247,775.

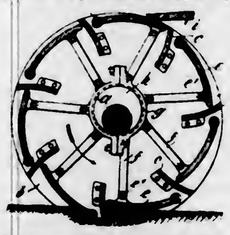
Claim.—The process herein described for the manufacture of chlorinated indigo dyestuffs, which consists in treating an indigo body with sulfurylchlorid.

812,599. **YELLOW-GREEN ANTHRAQUINONE DYE.** ROBERT E. SCHMIDT and KARL THUN, Elberfeld, Germany, assignors to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed Sept. 8, 1905. Serial No. 277,596.

Claim.—1. The herein-described dyestuffs of the anthracene series, being 1-4-diaryldiamido-8-oxyanthraquinone sulfonic acids containing the sulfonic group in the anthraquinone nucleus, obtainable by condensing with primary aromatic amins 1-4-8-trioxyanthraquinone sulfonic acid which is prepared by treating 1-4-8-trioxyanthraquinone with sulfonating agents and boric acid, which dyestuffs are in the shape of their alkaline salts dark-green powders soluble in hot water with a green color and when the dyestuffs dissolved in acetic acid are treated with a solution of stannous chlorid in hydrochloric acid they are decomposed under the formation of a leuco compound of the 1-4-8-trioxyanthraquinone sulfonic acid; and dyeing unmordanted and chrome-mordanted wool green shades, substantially as hereinbefore described.

2. The herein-described new dyestuff of the anthracene series, being 1-4-diparatolyldiamido-8-oxyanthraquinone sulfonic acid containing the sulfonic group in the anthraquinone nucleus, obtainable by condensing with paratoluidin the 1-4-8-trioxyanthraquinone sulfonic acid which is prepared by treating 1-4-8-trioxyanthraquinone with sulfonating agents and boric acid, which dyestuff is in the shape of its sodium salt a dark-green powder soluble in concentrated sulfuric acid with a violet-blue color and when the dyestuff dissolved in acetic acid is treated with a solution of stannous chlorid in hydrochloric acid it is decomposed under the formation of a leuco compound of the 1-4-8-trioxyanthraquinone sulfonic acid, and dyeing unmordanted and chrome-mordanted wool yellowish-green shades, substantially as hereinbefore described.

812,600. **WHEEL FOR PLOW-LOCOMOTIVES.** HEINRICH SCHNELL, Cologne, Germany. Filed Mar. 29, 1905. Serial No. 252,662.



Claim.—1. In a device of the character described, side bearings, transverse connections between said bearings forming box-like cavities, automatically-movable plungers suitably arranged for ejecting the earth from the cavities and thereby cleaning the same and means for positively actuating said plungers in both directions.

2. In a device of the character described, side bearings, transverse connections for said side bearings, means pivotally mounted between said connections adapted to be moved inwardly and outwardly and means embodying an eccentric about the axle connected with said first-mentioned means for positively actuating the same.

3. In a device of the character described, side bearings, connections between the same, a shaft on which said bearings are mounted, an eccentric mounted on said shaft, displaceable pivotally-mounted plungers and means actuated by said eccentric for moving said plungers inwardly and outwardly.

812,601. **POCKET-KNIFE.** GEORGE SCHRADE, Walden, N. Y. Filed Jan. 7, 1906. Serial No. 295,902.

Claim.—1. In a pocket-knife provided with automatic blade-opening mechanism operated by a push-button, a safety locking device comprising a forked detent housed between the lining and covering of the knife and adapted to embrace the shank of the push-button under its head, substantially as shown and described.

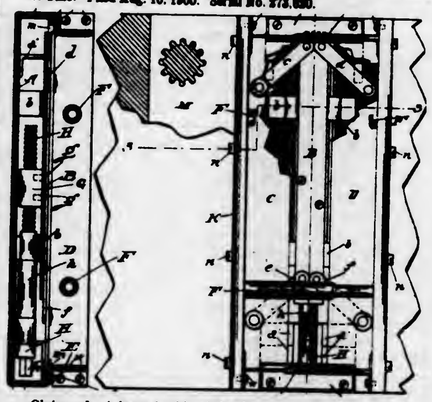
2. In a pocket-knife, the blades of which are automatically opened, substantially as described, a sliding plate housed between the lining and cover and adapted to engage the push-button and prevent its operation, substantially as shown and described.

3. In a pocket-knife, the blades of which are automatically opened, substantially as described, by a spring carrying a stud adapted to socket in holes in the shank of the blade, means for securing said stud-carrying spring to lining of the knife, comprising a washer formed to rest at end on the lining, and at the other end on the spring and a rivet securing said washer to the lining, said rivet passing through a hole in the spring greater in diameter than the rivet, substantially as shown and described.

4. In a pocket-knife the blade of which is automatically opened, substantially as described, a spring carrying a stud adapted to socket in holes in the shank of the blade, means for securing said stud-carrying spring to the lining of the knife, whereby the spring is allowed a lateral play substantially as shown and described.

5. In a pocket-knife, the blades of which are automatically opened, substantially as described, a blade-opening spring secured at the center by a rivet and resting on contiguous projections formed on the interior of the knife-back.

812,602. **LOOSE-LEAF BOOK-BACK.** WILLIAM J. SCHULTZ, Cincinnati, Ohio, and HERBERT GREBURE, Newport, Ky., assignors to The Tenacity Loose-Leaf Metal Company, Cincinnati, Ohio, a Corporation of Ohio. Filed Aug. 10, 1905. Serial No. 273,630.



Claim.—1. A loose-leaf book-back, comprising an outside casing, a sectional casing provided with rods, the outside casing formed to provide a shoulder for supporting the sectional casing, a plate or bar, links pivotally connected with said plate or bar and the sectional casing, and a screw-rod having controlling connection with said plate or bar whereby upon its operation the plate is moved and the sectional casing expanded or contracted.

2. A loose-leaf book-back comprising an outside casing having it ends provided with shoulders or rests, a sectional casing having its support on said shoulders, a plate or bar intermediate of the outside casing and sectional casing and having pivotal connection with the latter, a rotative rod having operative connection with said plate or bar, and means whereby said rod may be rotated from the outside of the casing.

3. A loose-leaf book-back comprising an outside casing whose ends are bent upon themselves to form shoulders, a sectional casing adapted to rest on said shoulders, the sectional casing being provided with attaching tubes or rods, a connecting plate or bar, links having pivotal connection with the sectional casing and the connecting-plate, a rotative rod having its bearing in the outside casing and controllingly connected with said connecting-plate, whereby, upon the rotation of said rod, the sectional casing will be expanded or contracted through the medium of the connecting plate or links.

4. A loose-leaf book-back comprising an outside casing provided with shoulders near its ends, a sectional casing adapted to rest

on said shoulders, a plate having controlling connection with the sectional casing, a riding-block secured to said plate, a rotative rod having its bearing in the outside casing and taking through the riding-block, means whereby the rod may be rotated from the outside, and reinforcing-plates secured to the ends of the outside casing and taking over the ends of the sectional casing.

5. A loose-leaf book-back comprising an outside casing whose ends are bent back upon themselves to form shoulders, one of said ends provided with a key-opening, a sectional casing having its bearings on the shoulders, a connecting-plate, links having pivotal connection with the plate and the sectional casing, a rotative rod having operative connection with said plate, and reinforcing-plates secured on the outside casing ends and taking over the ends of the sectional casing.

6. A loose-leaf book-back comprising an outside casing whose ends are bent upwardly upon itself, one of said ends provided with a keyhole, bridges or rests secured within said casing, a sectional casing adapted to rest on the bent-up ends of the outside casing, a connecting-plate having its bearings on said bridges or rests, links having pivotal connection with the connecting-plate and the sectional casing, a rotative rod having controlling connection with the connecting-plate, whereby upon its rotation the connecting-plate is moved and the sectional casing expanded or contracted.

7. A loose-leaf book-back comprising an outside casing, bridges or rests secured on said casing, said bridges or rests formed to provide guide or slide ways, a sectional casing provided with attaching-rods, said sectional casing adapted to rest on the outside casing, a plate intermediate of the outside casing and sectional casing and having pivotal connection with the sectional casing and adapted to slide in the guide or slide ways of said bridges or rests, a screw-rod in operative connection with said plate whereby the sectional casing may be expanded or contracted.

8. A loose-leaf book-back comprising an outside casing provided with transversely-extending bridges or rests, said bridges or rests being depressed at their centers to form guideways, a sectional casing, a connecting-plate adapted to slide in the guideways in said bridges or rests, links pivotally connected with the sectional casing and connecting-plate, a screw-rod having controlling connection with said connecting-plate, and means whereby the screw-rod may be turned and the sectional casing expanded or contracted.

9. In a loose-leaf book-back, comprising an outside casing, a sectional casing slidably mounted thereon, a screw-rod, a plate having operative connection with the sectional casing and adapted to be acted upon by said screw-rod, the combination with back members having portions bent out in opposite direction to that of the immediate surface, cover members having slots adapted to receive the bent-out portions of the back members, the edges of the cover members being curled or bent upon themselves, and a pin adapted to take through said portions of the back members and the cover members to form a hinge.

10. In a loose-leaf book-back, an outside casing, a sectional casing, a connecting-plate, links pivotally secured to the connecting-plate and sectional casing, a screw-rod in operative connection with said connecting-plate, back members secured to the sectional casing and having portions bent in an opposite direction to the contour of said members, cover members whose edges have slots to receive the bent portions of the back members and are curled upon themselves, and a pin adapted to pass through said portions of the back and cover members to form a hinge.

11. A loose-leaf book-back comprising an outside casing having bent-up ends, a sectional casing adapted to rest on said ends, a plate having controlling connection with the sectional casing, a screw-rod operatively connected with said plate, back members adapted to be secured to the sides of the sectional casing, said members provided with portions bent outwardly, a cover having a metallic member whose edge is curled upon itself and is provided with slots to receive the outwardly-bent portions of the cover members, and a pin adapted to pass through said curled edges and the outwardly-beat portions of the back members to form a hinge.

12. In a loose-leaf book-back, a hinge comprising a back member having adjacent slots extending transversely, the portions intermediate of the slots being bent outwardly, a cover member whose edge is curled or bent upon itself and cut away in places to receive the outwardly-bent portions of the back member, and a pin adapted to extend through the curled edge of the cover member and bent-out portions of the back member.

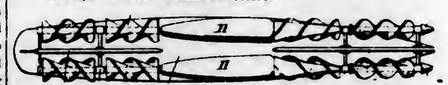
812,608. **CUFF-FASTENING.** HARRY C. SHEPHERD, Crete, Nebr. Filed June 17, 1905. Serial No. 265,768.

Claim.—1. A cuff-fastener comprising inner and outer portions, each having divergent clamping members, and means for tightening the clamping members on a cuff by causing a lengthwise-sliding movement of one member relatively to the other.

2. A cuff-fastener comprising an outer clamp having divergent members, an inner member having a bridge-piece provided with a tapped opening, clamping members divergent from said bridge-piece, and a screw engaging in said tapped hole and passing loosely through the outer jaw at the bend.

3. A cuff-fastener comprising an outer portion having divergent clamping members, provided with teeth at the inner side, an inner portion having a threaded perforated bridge, and divergent connecting members extended from the bridge, the said members having teeth on their outer sides, and a clamping-screw engaging in said tapped hole and passing loosely through the outer jaw portion.

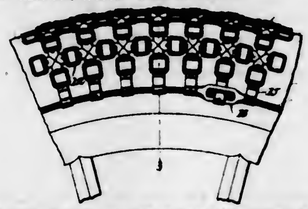
812,604. **MARINE VESSEL.** JOHN J. STEELE, New York, N. Y. Filed Apr. 14, 1905. Serial No. 255,493.



Claim.—1. A marine vessel having a hull with a pocket projecting downward from its bottom below the floor-line of the hull, said pocket being adapted to carry the engine crank-shaft, two propelling-screws projecting fore and aft and extending respectively from the ends of the pocket to the bow and stern, said screws having shafts projecting into the pocket and the shaft of the forward propeller being tapered from the pocket forward, for the purpose specified, means in the pocket for connecting the shafts with the crank-shaft, a conical head at the forward end of the forward screw and means for revolubly mounting the screws, said means for mounting the screws comprising bearings at the bow and stern and an additional bearing for each shaft located intermediate the pocket and the bow and stern bearings respectively.

2. A marine vessel having a hull with two pockets intermediate the length of the hull said pockets being spaced from each other and projecting below the floor-line of the hull and each being adapted to carry the engine crank-shafts, propelling-screws projecting fore and aft from each pocket, the screws having shafts extending into the pockets and the shafts of the forward screws tapering from the pockets forward, for the purpose specified, means in the pockets connecting the propeller-shafts with the crank-shafts, means for revolubly mounting the screws and keels located between the members of the forward and after pairs of screws.

812,605. **RUBBER-TIRE GUARD.** LEWIS SLAMA, Humboldt, Nebr. Filed July 6, 1905. Serial No. 268,907.



Claim.—1. A rubber-tire guard, comprising a network of alternating cruciform links and ring-like links, and means for securing the guard to a tire.

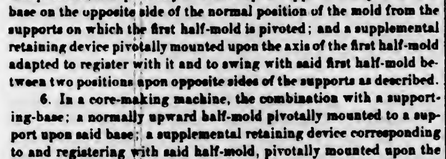
2. A rubber-tire guard, comprising a network of alternating cruciform links and ring-like links, the arms or members of the cruciform links being extended through the ring-like links and folded upon themselves.

3. A rubber-tire guard, comprising a network of alternating cruciform links and ring-like links, the arms or members of the cruciform links being extended through the ring-like links and folded upon themselves, and rivets extending through the cruciform links and engaging with the folded ends of the arms.

4. A rubber-tire guard, comprising a network of alternating cruciform links and ring-like links, wires for securing the guard to a tire, and tightening devices on said wires.

5. A rubber-tire guard, comprising a network of alternating cruciform links and ring-like links, the arms or members of the cruciform links being extended through the ring-like links and folded upon themselves, supplemental links connected to the side links of the guard, wires extended through said supplemental links, and turnbuckles for tightening said wires.

812,606. **CORE-MAKING MACHINE.** CHARLES A. SMITH, Chicago, Ill. Filed Nov. 20, 1905. Serial No. 288,294.



Claim.—1. In a core-making machine in combination with suitable supports two separable half-molds normally registering with each other, means for moving one of said half-molds out of engagement with and away from the other, a retaining device corresponding to the form of the half-mold just removed and means, for moving said retaining device into engagement with the second half-mold, for then moving the two parts to a position in which the molded core rests in the retaining device and for then removing the second half-mold away from the retaining device back to normal position.

2. In a core-making machine, in combination with a suitable support, two separable half-molds normally registering with each other, means for moving one of said half-molds out of engagement with and away from the other, a pivoted mounting on which the second half-mold is adapted to swing and a supplemental retaining device of the general form of the half-mold pivotally mounted upon the same axis as said second half-mold and adapted to register and rotate with said half-mold as described.

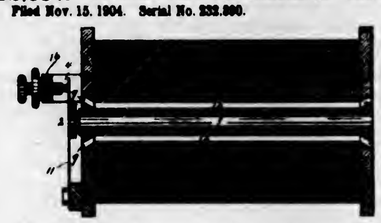
3. In a core-making machine, in combination with a suitable support, two half-molds normally in register with each other, pivotally mounted upon opposite sides of said normal position, and a supplemental retaining device of the general form of a half-mold pivotally mounted upon the same axis as one of said half-molds and adapted to register and rotate with said half-mold.

4. In a core-making machine, in combination with a suitable support, a mold made in two parts normally registering together, each pivotally mounted upon opposite sides of the mold, when the parts are together; and a supplemental retaining device of the form of a half-mold having openings in it in portions in which a half-mold is inclosed, pivotally mounted upon the same axis as one of said half-molds and registering with it and adapted to swing with it to each of two different positions.

5. In a core-making machine, the combination of a suitable base; a half-mold normally in upright position with reference to said base pivotally mounted upon suitable supports rising from the base; another half-mold adapted to cover said first half-mold when in normal position, also pivotally mounted upon supports rising from said base on the opposite side of the normal position of the mold from the supports on which the first half-mold is pivoted; and a supplemental retaining device pivotally mounted upon the axis of the first half-mold adapted to register with it and to swing with said first half-mold between two positions upon opposite sides of the supports as described.

6. In a core-making machine, the combination with a supporting-base; a normally upward half-mold pivotally mounted to a support upon said base; a supplemental retaining device corresponding to and registering with said half-mold, pivotally mounted upon the same axis as said half-mold and adapted to swing with it about its pivotal axis between positions upon opposite sides of the supports; other supports rising from said base on the opposite side of the normal position of said first half-mold; a second half-mold adapted to normally register with and cover said first half-mold, mounted upon pivots connected to the said second supports; and mechanism for permitting said second half-mold to move up and down through a short vertical distance with reference to said first half-mold as described.

812,607. **INDUCTION-COIL.** JOHN SPLITDORF, New York, N. Y. Filed Nov. 15, 1904. Serial No. 233,890.



Claim.—1. A casing or retainer for an induction-coil, having apertures through its walls extending from an air-space about the iron core to the outer atmosphere.

2. In an induction-coil inclosed in a casing or container, whose iron core is separated from the primary winding by an air-space, the iron core projecting beyond the walls of the container and the apertures 9 extending through the container from the air-space 12.

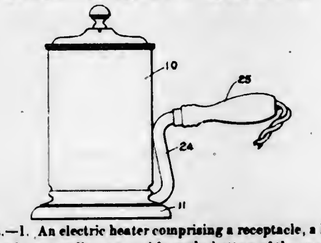
3. In an induction-coil, the combination with the primary and secondary windings, of a ventilated iron core, consisting of an open space around the core, and one or more apertures extending through the core; substantially as described.

4. In an electromagnet, means for ventilating the iron core, consisting of an open space around the core, and one or more apertures extending through the core; substantially as described.

812,608. **PROCESS OF MAKING A FORMIC-ALDEHYDE COMPOUND.** ALFRED STEPHAN, Gross-Lichterfelde, near Berlin, Germany. Filed Dec. 6, 1904. Serial No. 235,759.

Claim.—Process of producing a compound of phenol and formic aldehyde, consisting in heating phenol and a larger quantity of a solution of formic aldehyde of forty per cent. with an addition of lye, as a condensing medium and dissolvent, until a red-brown liquid is produced out of which acids precipitate a deposit, substantially as and for the purpose set forth.

812,609. **ELECTRIC HEATER FOR LIQUIDS.** GEORGE E. STEVENS, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed July 19, 1904. Serial No. 217,319.



Claim.—1. An electric heater comprising a receptacle, a hollow heating member extending upward from the bottom of the receptacle and open to the exterior of the receptacle at its lower end, an electric heating unit adapted to be inserted in and withdrawn from said member and having its resistance element in intimate thermal relation to the walls of said member, a lead extending from the upper end of the unit down through its center, and a second lead secured to the lower end of said unit.

2. An electric heater comprising a receptacle adapted to contain a liquid to be heated, a closed reentrant metallic tube extending upward from the bottom of said receptacle, a resistance unit mounted in said tube in good heat-conductive relation to the walls thereof, the resistance being provided with a joint within the tube below the normal liquid level to prevent burning out.

3. In an electric heater, a hollow heating member adapted to extend into the liquid to be heated, an edgewise-wound resistance unit located therein in heat-conductive relation to the walls thereof, comprising a central insulating-tube provided with a flange at one end upon which said resistance-winding is seated, a conducting-disk connected to the opposite end of said winding and resting upon the opposite end of said tube, a lead secured to said disk and extending through said tube, and a second lead secured to the outer end of the resistance unit.

4. An electric heater comprising a receptacle, a hollow tubular member within the receptacle extending upward through its bottom and closed at its upper end, an electric heating unit therein, comprising a heating-coil in close heat-conductive relation therewith, and means for removably holding said unit within said member.

5. An electric heater comprising a receptacle, a hollow tubular member within the receptacle extending upward through its bottom and closed at its upper end, an electric heating unit therein, comprising a coil corresponding in shape with said tubular member and in close heat-conductive relation therewith, means for removably holding said unit within said member, said means comprising a cap, a duct engaging therewith and communicating with the interior thereof, and a retaining member engaging the base of said receptacle and secured to said duct.

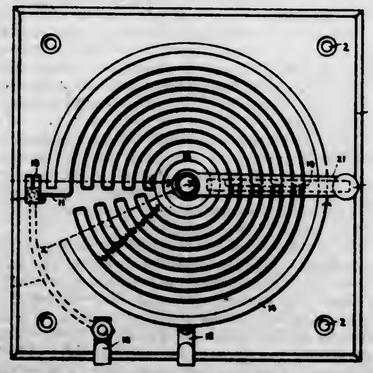
6. An electric heater comprising a receptacle, a hollow tubular member within the same extending upward through its bottom and closed at its upper end, a removable electric heating unit therein, a cap for closing the lower end of said member, a duct communicating with the interior of said cap and extending outward to form a handle for said receptacle, and means for securing said cap and said duct in removable relation with said receptacle.

7. An electric heater comprising a receptacle, a hollow tubular member within the same extending upward through its bottom and closed at its upper end, a removable electric heating unit therein, a flange forming the base of the receptacle, a cap for closing the lower end of said member, a duct engaging said cap and communicating with the interior thereof and extending outward to form a handle, and means for securing said cap and said duct in removable relation with said receptacle comprising a retaining member engaging said flanged base and secured to said duct.

812,610. CHIMNEY FOR INCANDESCENT GAS-BURNERS. LOUIS STOBBE, Posnig, Germany. Filed Sept. 8, 1903. Serial No. 172,266.

Claim.—In a lamp-chimney a lower portion, adapted to be supported by the gallery of a lamp and comprising an upper and a lower cylindrical neck of comparatively the same diameter, a globular or or other shaped enlargement between said necks, and openings in said enlargement for the admission of air, in combination with an upper portion comprising a globular or other shaped top and a rim fitting the upper neck of said lower portion, substantially as and for the purposes set forth.

812,611. RHEOSTAT. FRED L. STONE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 25, 1904. Serial No. 218,031.



Claim.—1. In a rheostat, the combination of a resistance-conductor comprising a series of parallel strips or bars alternately connected in sets of two, and a movable member provided with a series of bridging-contacts each adapted to serially connect two adjacent sets of strips or bars.

2. In a rheostat, the combination of an insulating-base, a resistance-conductor comprising a series of circular parallel strips or bars mounted upon said base and alternately connected in sets of two, and a concentrically-pivoted member extending over said strips or bars and provided with a series of spring-contacts each adapted to serially connect two sets of strips or bars.

3. In a rheostat, the combination of an insulating-base, a resistance-conductor comprising one or more pairs of parallel circular bars or strips mounted on said base, a concentric inner contact-ring connected to one end of said resistance member, an outer concentric contact-ring and a concentrically-pivoted member having one or more bridging-contacts each adapted to engage a pair of strips or bars, and a contact rod or plate adapted to engage said inner and outer concentric rings.

812,612. BACK-PROTECTION GARMENT. SAMUEL F. SWANTERS, Itasca, Ill. Filed Mar. 22, 1905. Serial No. 251,408.

Claim.—1. An undergarment adapted to cover the back and having an inner reinforcement covering the entire back thereof, said reinforcement being of relatively soft material, and means for separating the reinforcement from the main part of the back to provide an air-space.

2. An undergarment adapted to cover the back and having a reinforcement composed of an outer layer of woolen material covering the entire back portion, an inner layer of relatively soft material, and an intermediate layer of loose-meshed fabric, the last two layers also covering the entire back portion of the garment.

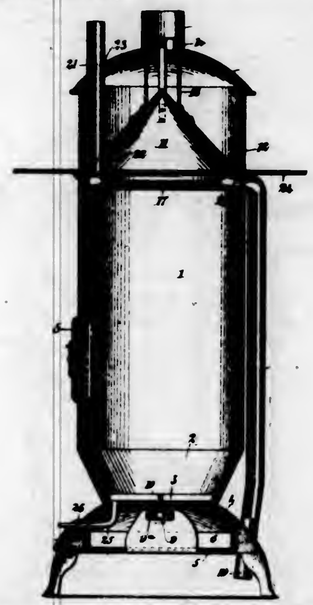
812,613. TOY PISTOL. CASSIUS TAFT, St. Joseph, Mo. Filed Jan. 24, 1905. Serial No. 242,560.

Claim.—In a toy pistol, a barrel provided with an annular recess at the muzzle, a transverse guide-web having a central aperture and spaced inwardly from the muzzle, a supporting-web between the guide-web and muzzle and of less thickness than the guide-web, whereby an annular recess is formed between the webs, a spring-actuated plunger operating through the guide-web, and resilient members connected at their outer ends in the annular muzzle-recess and converging toward and extending over the supporting-web and secured at the inner ends in the annular recess.

812,614. STOVE. CARL T. TAYLOR and GEORGE L. CLARK, Mount Sterling, Ill. Filed June 19, 1905. Serial No. 265,986.

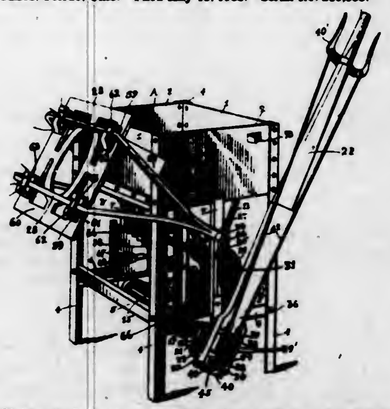
Claim.—1. A stove having a vertically-elongated body, a substantially conical reflector supported in the upper portion of said body, an air-ring disposed in the upper portion of said body and beneath the edge of said reflector, an inlet-pipe at the side of said body and leading air to said ring, and an outlet-pipe adapted to conduct air from said ring.

2. A stove having a substantially cylindrical body including a cover, a substantially conical reflector supported from said cover, an air-ring disposed within said body beneath the edge of said reflector, an inlet-pipe leading at the side of said body from a point near the floor and communicating with said air-ring, and an outlet-pipe leading from said air-ring and passing upwardly within said body and through said cover.



3. A stove having a substantially cylindrical body surmounted by a cover having a centrally-disposed opening therein, a collar projecting upwardly at said opening, a plurality of hangers attached to said collar and depending into the interior of said body, a substantially conical reflector attached to said hangers and supported thereby, an air-ring disposed under said reflector, an inlet-pipe leading to said air-ring, and an outlet-pipe leading therefrom.

812,615. CEMENT-BLOCK-MOLDING MACHINE. RITCHIE H. TEETS, Toledo, Ohio. Filed May 18, 1905. Serial No. 260,885.



Claim.—1. In a cement-block-molding machine, the combination with the mold-box A, of the bottom frame 10, a bottom mold plate or plates mounted on the bottom frame, the tubular rock-shaft 15 having the rock-plate 16 and the rock-arms 17, means connected to the rock-arms 17 and to the bottom frame adapted to move the bottom frame upward and downward through the box, as the shaft is rocked, the rock-shaft 20 within the tubular shaft having end portions extending beyond the ends of the tubular shaft provided with the rock-plates 21 and 21', the tamping-frame 28, adapted to be moved vertically and to swing laterally from and to a position over the mold-box, slide-bars pivotally connected to the tamping-frame, and movable in vertical guides, link-bars connecting the slide-bars to the rock-plates of the shaft 20, a clutch-lever loosely mounted on the shaft 20 beside the rock-plates 21 and 16, means to engage the lever with the rock-plate of either shaft, a tamping-plate, and means to secure the tamping-plate to the tamping-frame in position to enter the top of the mold-box, substantially as set forth.

2. In a cement-block-molding machine, the combination with a mold-box A, of a bottom frame 10, mounted on a lifting-bar, and movable upward and downward through the box by the lifting-bar, means comprising a rock-shaft, rock-arms on the shaft, and connecting-rods connecting the rock-arms with the lifting-bar, to raise and lower the lifting-bar, and stepped stop-plates, beneath the lifting-bar, and adjustable to limit the downward movement of the bottom frame to different distances above the bottom edges of the mold-box, substantially as set forth.

812,616. WEED-EXTERMINATOR. HERMAN TROHSL, Spokane, Wash., assignor of one-half to Albert J. Burt, Spokane, Wash. Filed Sept. 27, 1905. Serial No. 280,268.

Claim.—1. In a device of the class described, a tubular reservoir having a discharge-passage, a pointed penetrator at the lower end of the tube and having a longitudinal passage communicating with the discharge-passage and terminating at the point of the penetrator, and a valve controlling the discharge-passage.

2. In a device of the class described, a tubular reservoir having a discharge-passage, a conical-pointed penetrator at the lower end of the reservoir and having a longitudinal channel communicating with the discharge-passage and terminating at the point of the penetrator, a valve controlling the discharge-passage and provided with a finger-pull, and a spring for closing the valve.

3. In a device of the class described, a reservoir consisting of a tube adapted to contain a vegetation-destroying liquid and having a discharge-passage, a tapered penetrating-point secured to the lower end of the tube and having a longitudinal channel the upper end of which is in communication with the discharge-passage, a conical valve adapted to open and close the passage and having a stem provided at its upper end with a pull, a shoulder on the stem, a guide for the stem fixed to the tube, and a coil-spring reacting between the guide and the shoulder to maintain the valve in its closing position.

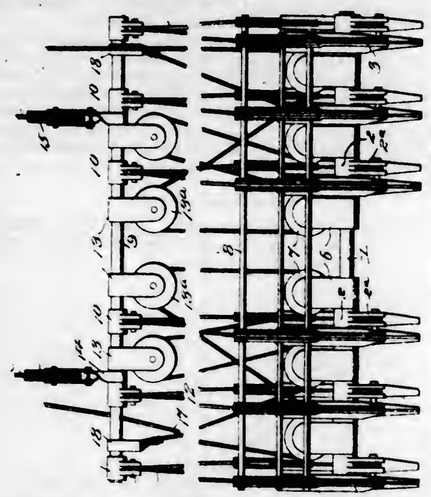
4. In a device of the class described, the combination with a tubular reservoir having a valve-controlled discharge-passage, of a pointed penetrator fixed to the tube and having a passage terminating at the penetrator-point for conducting the contents of the reservoir to the plant or weed into which the penetrator-point is inserted.

812,617. GRAB. JOHN A. THOMPSON, Morgan City, La. Filed Feb. 26, 1904. Serial No. 196,877.

Claim.—1. The combination with a pivot-shaft, of oppositely-disposed series of connected grab-fingers, reinforcing-plates connected to the fingers, a second pivot-shaft, operating-bars connected thereto and to the reinforcing-plates, and means for raising and lowering the shafts independently of each other.

2. The combination with a pivot-shaft having sleeves removably mounted thereon; of oppositely-arranged series of curved grab-

fingers extending from the sleeves, reinforcing-plates upon said fingers, connecting-rods secured to the fingers of each series, sheaves connected to the pivot-shaft, a second pivot-shaft, sheaves connected thereto, operating-bars connected to the shaft and to the reinforcing-plates, hoisting-cables arranged upon the sheaves, and hoisting-cables connected to the second pivot-shaft.



3. In a device of the character described, the combination with a pivot-shaft having sleeves removably mounted thereon; of oppositely-arranged series of grab-fingers extending from the sleeves, a second pivot-shaft, operating-bars connected thereto and to the grab-fingers, sheaves connected to the pivot-shafts, and means for drawing the sheaves simultaneously toward each other.

4. In a grapple the combination of oppositely-disposed claw members, spaced plates secured to said claw members, links or bars pivoted between said plates, elevating means connected to the links, and operating means for opening and closing the claws interposed between the links and claws.

5. In a grapple, a series of tongs, a corresponding series of links pivoted to the members of the tongs, rods or bars connecting the tongs and links in series, elevating means applied to the rod connecting the links, and operating means having running connection with both of said rods to effect an opening and closing of the tongs.

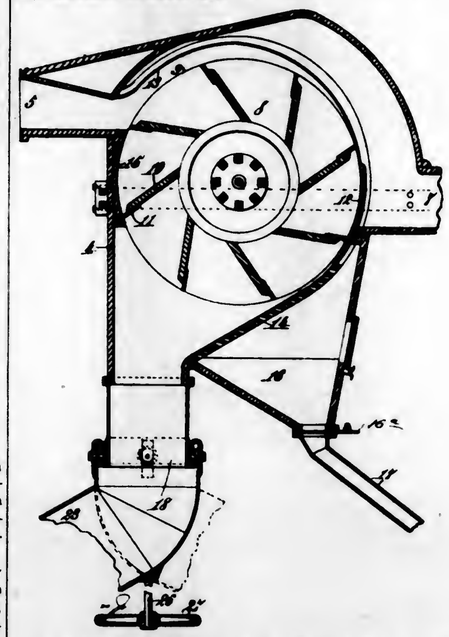
6. In a grapple, a series of tongs, a corresponding series of links pivoted to the members of the tongs, rods or bars connecting the tongs and links in series, sheave-pulleys applied to said rods or bars and a rope connected to the device and passed around said sheave-pulleys and adapted to be manipulated to effect an opening and a closing of the tongs.

812,618. **COTTON-HANDLING APPARATUS.** ALBERT F. TIDWELL, Colina, Tex. Filed Apr. 4, 1905. Serial No. 253,886.

Claim.—1. In a cotton-handling apparatus, a casing, a pneumatic conveyer opening into the casing, a suction-flue, and a discharge-chute for cleaned cotton, leading from the casing, a screen between the conveyer and the suction-flue, a cleaning-screen between the suction-flue and the discharge-chute, for screening the cotton before it reaches said chute, and a force-feeder in the casing to positively move the cotton from the conveyer to the cleaning-screen and operable solely by the blast of air entering the casing from said pneumatic conveyer.

2. In a cotton-handling apparatus, a casing, a pneumatic conveyer opening into the casing, a suction-flue, and a discharge-chute for cleaned cotton, leading from the casing, a screen between the conveyer and the suction-flue, a cleaning-screen between the suction-flue and the discharge-chute, for screening the cotton before it reaches said chute, and a force-feeder in the casing, arranged to be operated solely by the blast of air entering the casing from said pneumatic conveyer and comprising a plurality of blades.

3. In a cotton-handling apparatus, a casing, a pneumatic conveyer opening into the casing, a suction-flue, and a discharge-chute for cleaned cotton, leading from the casing, a screen between the conveyer and the suction-flue, a cleaning-screen between the suction-flue and the discharge-chute, for screening cotton before it reaches said chute, a force-feeder in the casing, arranged for operation solely by the air-blast entering the casing from said pneumatic conveyer, said force-feeder involving a plurality of blades provided with flexible strips at their outer edges, and curved members in the casing, arranged to be traversed by said flexible strips, the extent of each curved member being such that at least one flexible strip will be always in contact with one of them.



4. In a cotton-handling apparatus, a casing, a fan in the casing having blades, means in the casing to be traversed by the blades and coöperative with the latter to divide the casing into independent chambers, a screen in one of the chambers, and means for drawing air through the screen-chamber and through the screen to effect the cleaning of cotton, and to also turn the fan.

5. In a cotton-handling apparatus, a casing, a fan in the casing having blades, means in the casing to be traversed by the blades and coöperative with the latter to divide the casing into independent chambers, a screen in one of the chambers, means for drawing air through the screen-chamber and through the screen to effect the cleaning of cotton, and to also turn the fan, and a screen in the other chamber of the casing, said blades serving to carry the cotton in succession against the screens.

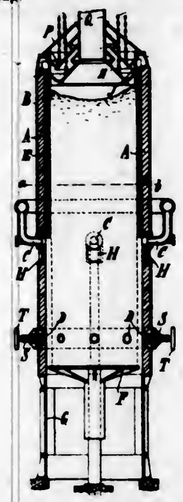
6. In a cotton-handling apparatus, the combination of a cotton-cleaning casing, a force-feeder for the cotton in the casing, and a suction-pipe communicating with the casing, the suction through the pipe serving as the sole means for rotating the said force-feeder.

7. A cotton-handling apparatus having a storage-house, cotton-cleaning mechanism, a plurality of bins arranged in annular order in the storage-house, there being an open space surrounded by the bins, a discharge-chute leading from the cotton-cleaning mechanism and mounted for revolving movement to deliver cleaned cotton in any one of said bins, a passage-way between two of the bins leading into said open space, and means situated in said open space for revolving said discharge-chute.

812,619. **METHOD OF PRESERVING THE INNER WALLS OF FURNACES.** FRIEDRICH C. W. TIEM, Hamburg, Germany. Filed Apr. 21, 1905. Serial No. 256,223.

Claim.—1. A method of preserving inner walls of shaft-furnaces, which consists in building up against the inner wall of said furnace during the charge thereof, a gravity-movable casing, and then piercing said casing in front of the twyers as the said casing lowers so that

means to sustain combustion can pass through the openings into the interior of the casing.



2. A method of preserving inner walls of shaft-furnaces which consists in building up against the inner wall of the furnace during the charge thereof, a gravity-movable lining, piercing said lining as the said lining lowers so that means to sustain combustion can pass into the interior of the furnace and adding to the lining at the top thereof when the lining lowers.

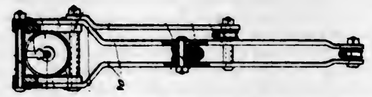
812,620. **ATTACHMENT FOR LADDERS.** FRANK VAN ALSTINE, Sacramento, Cal. Filed May 23, 1905. Serial No. 261,777.

Claim.—1. An attachment for ladders, comprising means adapted to be suspended from a step of the ladder, a table having connections therewith, movable outwardly and inwardly with reference thereto, and braces for the table in its outward position, movable inwardly and outwardly therewith.

2. An attachment for ladders, comprising means adapted to be suspended from a step of the ladder, a table having connections therewith and movable outwardly and inwardly with respect thereto, and having parallel side members formed with corresponding segmental slots, said means having inwardly-projecting devices working in said slots, braces adapted to move outwardly and inwardly with the table, having movable connections with the forward ends of the said side members of the table, and also having adjustable connections with parallel members of the means referred to.

3. An attachment for ladders, comprising hangers adapted to be suspended from a step of the ladder, a table having connections therewith and movable outwardly and inwardly with respect thereto, and also having parallel side members formed with corresponding segmental slots, the lower edges of said side members being curved in correspondence with the edges of the slots, said hangers having inwardly-projecting devices working in the slots, and similar projections on which ride the lower edges of the said side members, braces for the table, movable outwardly and inwardly with respect to the hangers, and having connections with the forward ends of the said side members of the table, together with adjustable connections with parallel members of the said hangers.

812,621. **TAKE-UP DEVICE FOR OVERHEAD-CABLE RAILWAYS.** JOHN G. WAILS, Delta, Pa. Filed Aug. 31, 1905. Serial No. 276,005.



Claim.—1. In a conveying apparatus, a supporting-cable, a carriage mounted for travel on said cable and provided with a hoisting-pulley, an endless cable connected to the carriage for actuating the same, an auxiliary cable disposed above the endless cable and provided with a plurality of stop-buttons, a roller journaled on the carriage for engagement with the button-cable, a hoisting-cable passing over the hoisting-pulley and having a receptacle attached thereto, a plurality of carriers for supporting the several cables and adapted to engage said stop-buttons, and a tension device for the auxiliary cable.

2. In a conveying apparatus, a head-tower and a tail-tower, a supporting-cable connecting the two, a pulley journaled on one of said towers, a plurality of pulleys rotatably mounted on the opposite tower, a carriage mounted for travel on the supporting-cable, an endless belt connected to the carriage and passing over a pulley on one of the towers and engaging a pair of pulleys on the opposite tower, an auxiliary cable connected to the tail-tower and passing over one of the pulleys on the head-tower, said auxiliary cable being provided with a terminal weight and having a plurality of spaced stop-buttons secured thereto, a hoisting-cable engaging a fourth pulley and connected to the carriage, and a plurality of carriers for supporting said cables and adapted to engage said stop-buttons.

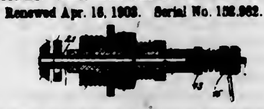
3. In a conveying apparatus, a cable-carrier comprising a pair of spaced side members having their upper ends offset and connected by transverse bolts, said side members being provided with wear-plates.

4. In a conveying apparatus, a cable-carrier comprising a pair of spaced side members having their upper ends offset and connected by transverse bolts, wear-plates engaging the side members, and sleeves carried by the transverse bolts and engaging the wear-plates.

5. In a conveying apparatus, a cable-carrier comprising a pair of spaced side members having their upper ends offset and connected by transverse bolts, wear-plates carried by the side members and retained in position by the transverse bolts, pulleys journaled between said side members, a plate secured to the offset portion of the carrier and spaced from the adjacent side member, and a pulley journaled between said plate and side member.

6. In a conveying apparatus, a cable-carrier comprising a pair of spaced side members having their upper ends offset and connected by transverse bolts, wear-plates engaging the side members, sleeves mounted on the bolts and engaging the wear-plates, pulleys journaled between the side members, a plate spaced from one of the side members and secured to the offset portion of the carrier by one of the transverse bolts, and a pulley journaled between said plate and the adjacent side member.

812,622. **ELECTRICAL IGNITER FOR INTERNAL-COMBUSTION ENGINES.** WILLIAM H. WALTER, New York, N. Y. Filed Mar. 24, 1903. Renewed Apr. 16, 1903. Serial No. 152,962.



Claim.—1. In an electrical igniter, the combination of a hollow plug provided near its inner end with openings or slots and with a ring-like terminal, said openings or slots lying inside of the ring-terminal and the latter presenting a continuous active edge of thin section, and a beveled disk-like terminal having an active edge of thin section disposed in parallel and opposing relation to the corresponding edge of the ring-like terminal and forming therewith an intermediate sparking gap of uniform width, said ring-like terminal being presented edgewise to the disk-like terminal.

2. An electrical igniter, comprising a bushing having an annular terminal of thin cross-section joined thereto by intervening ligaments, and a solid circular terminal having an edge of thin section, said annular terminal and the thin edge of the solid terminal being separated by an intervening sparking gap.

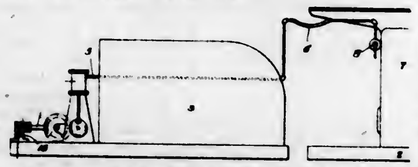
3. An electrical igniter having a solid disk-like terminal pro-

vided with a beveled periphery forming an edge of thin section, and an annular terminal having a thin active edge, both terminals presenting edges of thin sections in opposing and parallel relation, the thin edge of each terminal being continuous and lying in one plane.

4. A non-clogging electrical igniter, comprising a bushing provided with spaced webs or ligaments, and with an annular terminal having an edge of thin section, said terminal being separated from the bushing by slots or spaces formed by and between the webs or ligaments, and a solid terminal having a beveled periphery forming an edge of thin section, which is presented in a concentric and opposing relation to the corresponding edge of the annular terminal.

5. An ignition device of the jump-spark class including a relatively stationary body portion, an annular terminal spaced apart therefrom but connected thereto leaving air-passages between said terminal and said body portion, a second terminal situated adjacent to the annular terminal and being spaced away from the same at all times.

812,623. **UNLOADING MECHANISM.** GEORGE WARD, Homestead, Pa., assignor of one-fourth to Bernhard Hoppe, Homestead, Pa. Filed Aug. 31, 1905. Serial No. 276,516.



Claim.—1. Unloading apparatus comprising in combination with the tender and boiler of a railway-locomotive, an independent engine mounted on the tender provided with a driving-shaft, means for coupling said driving-shaft to an adjacent shaft located upon a car adapted to be coupled with the tender, a steam-supply pipe connecting the locomotive-boiler with said engine, and a valve-controlled connection interposed in said supply-pipe, substantially as set forth.

2. Unloading apparatus comprising in combination with the tender and boiler of a railway-locomotive, an independent engine mounted on the tender provided with a driving-shaft, a longitudinally-shifting coupling for said shaft and actuating mechanism therefor, and a car adapted to be coupled with the tender and provided with a centrally-located door-operating shaft arranged on the same level with said shifting coupling and adapted to be connected therewith, substantially as set forth.

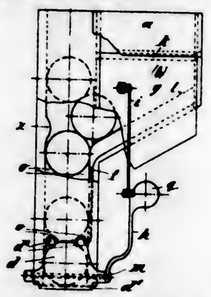
3. Unloading apparatus comprising in combination with the tender and boiler of a railway-locomotive, an independent engine mounted on the tender provided with a driving-shaft, a longitudinally-shifting coupling for said shaft and actuating mechanism therefor, and a car adapted to be coupled with the tender and provided with opening and closing doors and a centrally-located door-operating shaft arranged on the same level with said shifting coupling and adapted to be connected therewith, the shaft of said car being provided with means connected with said opening and closing doors of the car, substantially as set forth.

4. In a car, the combination with opening and closing gates thereof, of a central longitudinally-arranged shaft connected with said gates, said shaft being provided at one end with a surrounding internally-squared sliding clutch and at the other end with a squared terminal arranged to be engaged by a similar sliding clutch of an adjacent car, substantially as set forth.

5. In a car, the combination with opening and closing gates thereof, of a central longitudinally-arranged shaft connected with said gates, said shaft being provided at one end with a surrounding internally-squared sliding clutch and at the other end with a squared terminal arranged to be engaged by a similar sliding clutch of an adjacent car, with means for shifting said clutch and for locking the shaft against rotation, substantially as set forth.

6. The combination with a dumping-car having opening and closing gates, of a longitudinally-arranged shaft connected with said gates by flexible devices, said shaft having at one end a slidingly-mounted clutch provided with peripheral rack-teeth and an interior shaft-engaging cavity, a pinion engaging said teeth and provided with an operating-shaft, a toothed locking-wheel secured to the shaft, and a locking-bar provided with corresponding teeth, said longitudinal shaft being provided at its other end with a terminal arranged to be engaged by a similar shifting clutch, substantially as set forth.

812,624. **APPARATUS FOR DELIVERING OR COUNTING COINS AND THE LIKE.** LEO WEINERS and LAZAR A. RABINOWITCH, Vienna, Austria-Hungary; said Weinrib assignor to said Rabinowitch. Filed July 13, 1904. Serial No. 216,943.



Claim.—1. In apparatus for delivering and counting coins, counters, tokens and other like objects, the combination of a reservoir, a selection-chamber below said reservoir, a vertically-reciprocatory slide the upper edge of which is adapted to force its way into said reservoir and thereby stir the objects lying in disorder therein thereby causing part of them to fall into said selection-chamber corresponding to their thickness, means for actuating said slide and means for withdrawing said objects from the selection-chamber.

2. In apparatus for delivering and counting coins, counters, tokens and other like objects, the combination of a reservoir, a selection-chamber below same, a chute, and a slide having an inclined strip thereon, the latter constituting the bottom or floor of the selection-chamber and adapted to assist in stirring or unwedging the objects therein so that part of them may slide down into the chute.

3. In apparatus for delivering and counting coins, counters, tokens and other like objects, the combination of a reservoir, a selection-chamber below same, a chute and a projection fixed so as to project sufficiently over the entrance of the chute to serve as a stop for the object immediately against it, thereby compelling the objects which may have become wedged together in the selection-chamber to change their positions.

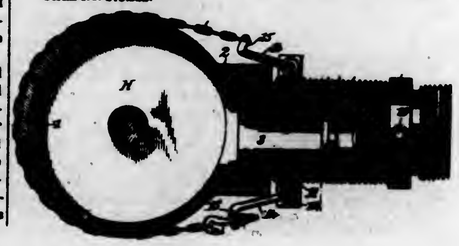
4. In an apparatus such as described, an upright coin-chute having horizontally-spaced openings in one face, and a member provided with points movable through said openings.

5. In an apparatus such as described, a coin-chute having openings in one face, a member provided with spaced points movable through said openings, and means operable by said member for opening or closing the lower end of said chute.

6. The combination, with the coin-chute c having the superposed openings o in one face, of the lever d adapted to extend at its end d' over the lower end of said chute, the spring p for normally maintaining said lever in the aforesaid position, and the superposed pushes q having points d^3 movable in said openings o into the path of the coins, said pushes abutting against said lever and serving when pushed inwardly to move the end d' away from the end of said chute.

7. In an apparatus such as described, in combination, a coin-chute provided in one face with superposed rows of horizontally-spaced openings, push members each having points movable through the openings in each row, and a lever pivoted upon one face of the chute, normally closing the lower end thereof, and abutting against said push members.

812,625. **HOSE AND HYDRANT CONNECTION.** LEROY A. WESTON, Adams, Mass. Filed Apr. 20, 1904. Renewed Aug. 8, 1905. Serial No. 273,323.



Claim.—1. A hose and hydrant connection, comprising a tubular member adapted at one end for engagement with the coupling member of a hose-section, and having at the other end a smooth-bored socket to receive the threaded thimble of a hydrant, and means carried by said tubular member for securing it in position upon a hydrant.

2. A hose and hydrant connection, comprising a tubular member threaded at one end for engagement with a coupling member carried by a hose-section and having a smooth-bored socket at the other end to receive the thimble of a hydrant, and means carried by said tubular member for securing it in position upon a hydrant.

3. A hose and hydrant connection, comprising an externally-threaded tubular member adapted at one end for engagement with a coupling member carried by a hose-section, and having at the other end a socket adapted to receive the thimble of a hydrant, a collar threaded upon the outer surface of said tubular member, and means carried by said collar for securing the tubular member in position upon a hydrant.

4. A hose and hydrant connection, comprising a tubular member having a socket adapted to receive the thimble of a hydrant, and flexible means carried by said tubular member to encircle the hydrant, and means also carried by said tubular member for placing said flexible means under tension.

5. A hose and hydrant connection, comprising a tubular member having a smooth-bored socket adapted to receive the thimble of a hydrant, a collar adjustable on said tubular member, flexible means carried by said collar to encircle a hydrant, and means carried by said collar for tightening said flexible means.

6. A hose and hydrant connection, comprising a tubular member adapted to receive the thimble of a hydrant, a collar adjustably mounted on said tubular member, pivoted arms carried by said collar, a flexible member connecting said arms, and means for drawing said flexible member taut.

7. A hose and hydrant connection, comprising an externally-threaded tubular member having a smooth-bored socket in one end thereof to receive a hydrant-thimble, a collar threaded upon said tubular member, flexible means carried by said collar to encircle the hydrant, and means provided on said tubular member for rotating the said tubular member within said collar.

8. The combination in a hose and hydrant connection, of a tubular member having a smooth-bored socket in one end thereof and having the other end threaded for engagement with a coupling member carried by a hose-section, a collar threaded upon the end of the tubular member having the socket therein, a pair of pivoted arms carried by said collar, a flexible member attached to one of said arms, a hook carried by the other of said arms and adapted to engage the flexible member, and means for adjusting said hook in the pivoted member to apply tension to said flexible member.

9. A hose and hydrant connection comprising a tubular member having a socket adapted to receive the thimble of a hydrant, a collar adjustable on said tubular member, pivoted arms carried by said collar, and a flexible member connecting said arms.

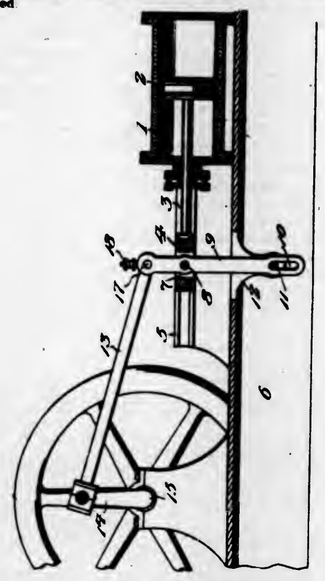
10. A hose and hydrant connection comprising a tubular member having a socket adapted to receive the thimble of a hydrant, a collar adjustably mounted on said tubular member, pivoted arms carried by said collar, a flexible member attached to one of said arms, and a hook adjustable in the other arm and adapted to engage the flexible member.

11. A hose and hydrant connection comprising a tubular member having a socket adaptde to receive the thimble of a hydrant, a collar threaded upon said tubular member flexible means carried by said collar to encircle the hydrant, means carried by said collar for tightening said flexible means, and means on said tubular member for engagement by a spanner to rotate the tubular member within said collar.

12. A hose and hydrant connection comprising an externally-threaded tubular member provided at one end with a reduced threaded portion for engagement with a coupling member, and having at the other end a socket adapted to receive the thimble of a hydrant, flexible means carried by said tubular member to encircle the hydrant, and means also carried by said tubular member for placing said flexible means under tension.

812,626. **POWER-TRANSMITTING APPARATUS.** WILLIAM L. WILSON, Tilden, Ill. Filed Dec. 13, 1904. Serial No. 236,708.

Claim.—A power-transmitting mechanism comprising a reciprocating element, a slotted cross-head connected therewith, a lever extending through the slotted cross-head and being pivotally connected therewith about midway between the center and the upper end of the lever, the pivoted portion of the lever being in the center of the slot of the cross-head and said slot being of a length to give a clearance to the opposite edges of the lever during oscillating movement of the latter, said lever having a slot at its lower end, a connecting-rod pivotally attached to the upper end of the lever, a shaft having a crank-arm secured to the connecting-rod, the movable fulcrum and the clearance of the intermediate pivoted portion of the lever serving to operate conjointly during oscillation of the lever, substantially as specified.



812,627. **GAS-REGULATING DEVICE.** CHARLES E. WIRTH and WILLIAM W. BRADLEY, Waterbury, Conn., assignors to The Plume and Atwood Mfg. Co., Waterbury, Conn., a Corporation of Connecticut. Filed Nov. 23, 1904. Serial No. 234,465.

Claim.—1. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a revoluble cap closely surrounding the same, said parts being each provided in the adjacent top portions with a single opening or gas-passage of appreciable area at one side of the axial center and one wall of each of which openings agrees with the axial center of the nipple for regulating the supply of gas by the eccentric relation of one opening to the other.

2. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a revoluble cap closely surrounding the same, said parts being each provided in the adjacent top portions with a single opening or gas-passage of appreciable area at one side of the axial center and one wall of each of

which openings agrees with the axial center of the nipple for regulating the supply of gas by the eccentric relation of one opening to the

of which is made eccentric to the axial center of the Bunsen tube, cap and nipple.

pressing the collar, and a connection between the collar and the valve-

primary hub between the heads, a secondary hub mounted loosely

which openings agree with the axial center of the nipple for regulating the supply of gas by the eccentric relation of one opening to the other and means for connecting the nipple and revoluble cap to permit a revoluble movement but prevent accidental separation longitudinally.

3. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a cap surrounding the same, said parts being provided with openings or gas-passages in the top of the nipple and top of the cap that are made eccentric to the axial center of the said nipple and cap, the nipple being provided near its upper end with a circumferential groove and the cap fitting over the same provided with a circumferential groove in the onter surface and consequent rib on the inner surface fitting into the groove of the nipple and so connecting the parts to prevent longitudinal separation but providing for a revoluble movement of the cap upon the nipple and a gas-tight joint, and means adapted to form a frictional contact of the cap upon the nipple, permitting the revoluble movement but preventing accidental shifting of the parts.

4. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a cap surrounding the same, said parts being provided with openings or gas-passages in the top of the nipple and top of the cap that are made eccentric to the axial center of the said nipple and cap, the nipple being provided near its upper end with a circumferential groove and the cap fitting over the same provided with a circumferential groove in the outer surface and consequent rib on the inner surface fitting into the groove of the nipple and so connecting the parts to prevent longitudinal separation but providing for a revoluble movement of the capupon the nipple and a gas-tight joint, and one or more tongues provided in the cap by slotting the same so that the tongues bear frictionally against the surface of the nipple.

5. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a cap surrounding the same, said parts being provided with openings or gas-passages in the top of the nipple and top of the cap, the nipple being provided near its upper end with a circumferential groove and the cap fitting over the same provided with a circumferential groove in the outer surface and consequent rib on the inner surface fitting into the groove of the nipple and so connecting the parts to prevent longitudinal separation but providing for a revoluble movement of the cap upon the nipple and a gas-tight joint.

6. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a cap surrounding the same, said parts being provided with openings or gas-passages in the top of the nipple and top of the cap, the nipple being provided near its upper end with a circumferential groove and the cap fitting over the same provided with a circumferential groove in the outer surface and consequent rib on the inner surface fitting into the groove of the nipple and so connecting the parts to prevent longitudinal separation but providing for a revoluble movement of the cap upon the nipple and a gas-tight joint, and means adapted to form a frictional contact of the cap upon the nipple, permitting the revoluble movement but preventing accidental shifting of the parts.

7. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a revoluble cap closely surrounding the same, said parts being provided in the top portions with openings of appreciable area, one of said openings being at one side of the axial center, for regulating the supply of gas by the eccentric relation of one opening to the other, and means for connecting the nipple and revoluble cap to permit a revoluble movement but prevent accidental separation longitudinally.

8. In a gas-regulating device, a nipple or member adapted to be connected in a fixed relation to a gas tube or pipe and a cap surrounding the same, said parts being provided with openings in the top portions, one of said openings being eccentric to the axial center of the said nipple and cap, the nipple being provided near its upper end with a circumferential groove and the cap fitting over the same provided with a circumferential groove in the outer surface and consequent rib on the inner surface fitting into the groove of the nipple and so connecting the parts to prevent longitudinal separation but providing for a revoluble movement of the cap upon the nipple and a gas-tight joint.

9. A gas-regulating device comprising a Bunsen tube, a hood, an air-distributer and a cap connected together and forming a unitary revoluble member, a nipple or member received at one end within the cap and at its other end interiorly threaded and adapted to be screwed upon the upper end of a gas tube or pipe into a fixed relation therewith, said nipple being closed at its upper end adjacent to the top of the cap, said nipple and said cap being provided with openings one of which is made eccentric to the axial center of the Bunsen tube, cap and nipple.

10. A gas-regulating device, comprising a Bunsen tube a hood, an air-distributer and a cap connected together and forming a unitary revoluble member, a nipple or member received at one end within the cap and at its other end interiorly threaded and adapted to be screwed upon the upper end of a gas tube or pipe into a fixed relation therewith, said nipple being closed at its upper end adjacent to the top of the cap, said nipple and said cap being provided with openings one of which is made eccentric to the axial center of the Bunsen tube, cap and nipple, and means for connecting the cap and nipple so as to provide a gas-tight joint to prevent longitudinal movement but provide for the revoluble movement.

812,628. **HYDRAULIC DISTRIBUTING-VALVE.** WILLIAM H. WOOD, Media, Pa. Filed Mar. 15, 1905. Serial No. 250,281.

Claim.—1. In a device of the character described, a casing having three peripheral delivery-ports and an inlet, a hollow rotary valve seated in said casing, between said ports and inlet, said valve being provided with a plurality of ports arranged to register simultaneously with the ports in the casing and other ports arranged to register singly with said ports in the casing, the valve and ports being constructed and arranged to enable any one, any two or three of the delivery-ports to be employed, and means for manually actuating the valve.

2. In a device of the character described, a casing having three peripheral delivery-ports and an inlet, a hollow rotary valve seated in said casing, between said ports and inlet, and having a central tubular extension bearing in said casing and communicating with said inlet, said valve being provided with a plurality of ports arranged to register simultaneously with the ports in the casing and other ports arranged to register singly with said ports in the casing, the valve and ports being constructed and arranged to enable any one, two or three of the delivery-ports to be employed, and means for manually actuating the valve.

3. In a device of the character described, a casing having three peripheral delivery-ports and an inlet, a hollow rotary valve seated in said casing, between said ports and inlet, said valve being provided with a plurality of ports arranged to register simultaneously with the ports in the casing and other ports arranged to register singly with said ports in the casing, the valve and ports being constructed and arranged to enable any one, two or three of the delivery-ports to be employed, means for accordingly moving or actuating said valve, and means for the retention of said valve at the requisite points of adjustment in its movement.

812,629. **VEHICLE-WHEEL.** MANUEL G. BARIO, New York, N. Y. Filed Aug. 31, 1905. Serial No. 276,562.

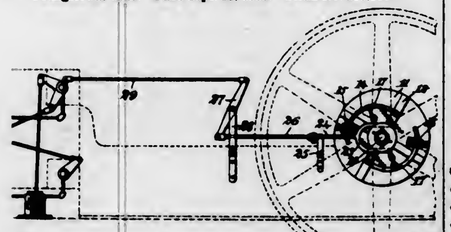
Claim.—1 In vehicle-wheels, the combination with a primary and a secondary hub, one loosely mounted relatively to the other, chain connections between the hubs, limiting their movement in opposite directions, a pneumatic tube located between the two hubs, being sustained by the outer hub and provided with an inner annular flange, and a check or guiding collar loosly mounted on the inner hub, having annular offsets between which the flange of the pneumatic tube is received.

2. In vehicle-wheels a primary hub having inner and outer heads, as described, a check or guiding collar loosely mounted on the primary hub between the heads, a secondary hub mounted loosely between the heads and having movement to and from the said collar around which it extends, a pneumatic tube secured by inflation within the secondary hub in connection with the annular grooves therein, and means carried by the said collar for gripping the said tube, the latter being provided with an integral boss around the opening adapted for the stem of an inflating-valve, and being also provided with an integral rim at the central inner portion.

3. In vehicle-wheels, a primary hub as described, heads for the same, a check-collar loosely mounted on the primary hub between the heads, having movement in direction of the heads, a secondary hub provided with an inner chamber, which secondary hub extends between the heads of the primary hub, having play between said heads corresponding to the lateral play of the said collar, the said chamber being provided with a segmental peripheral wall and straight side walls, a pneumatic tube located within the chamber of the secondary hub, the chamber of which tube in the cross-section of the tube is eccentric to its outside circular surface and the upper side portions of the tube being closely fitted to the corresponding walls of the chamber in the secondary hub, and extensions from the said collar, which extensions receive between them a portion of the said pneumatic tube, a space for play being provided between such portions of the pneumatic tube and the collar.

4. In vehicle-wheels, the combination of a primary hub and a secondary hub, both directly connected by members denominated a check-collar and a circular pneumatic tube intervening between said hubs, heads attached to the primary hub, the said heads connecting with chains leading directly to the secondary hub and connected thereto, the check-collar being capable of slight movement in the direction of the heads, or said collar being in contact with the heads and in this case being without said movement, an annular rib exteriorly located on the collar at each side of its center, the secondary hub being mounted to move freely eccentrically and laterally at the same time between the heads, the eccentric movement being limited by the pneumatic tube and the lateral movement limited by said heads, and at the same time the said hub being capable of circular movement to one side or the other, this movement being limited by the chains connecting the hubs, the inner edge of the secondary hub being normally spaced from the said collar, said secondary hub being provided with a chamber in its inner face having its peripheral wall concaved, its side walls straight and the upper portions of the side walls provided with annular grooves, and the pneumatic tube fitted to the concaved wall of said chamber of the secondary hub and the grooved portions of the side walls of said chamber, said tube being thickest at its inner portion and provided at its inner portion with an annular rim or flange which enters the space between the ribs of said collar, an annular space intervening between the said rim and the opposing surface of the collar, and another annular space being made to intervene between the sides of the inner portion of said pneumatic tube and the corresponding opposite surface of the collar, for the purpose specified.

812,630. **GOVERNOR MECHANISM.** HERVEY T. BALLARD, Youngstown, Ohio. Filed Sept. 26, 1905. Serial No. 280,164.



Claim.—1. The combination with a Corliss engine, of a governor-disk having ribs extending along one side of the face thereof, governor-arms mounted on the disk and arranged to slide against the ribs, weights attached to the governor-arms and located between the ribs, a spring actuating the governor-arms in one direction, an elbow-lever fulcrumed on the disk at the side bearing the arm, one arm of the elbow-lever projecting through the disk, a link connecting one arm of the elbow-lever with the governor-arm, a rod in connection with the other arm of the elbow-lever, and projecting through the disk, a collar loose on the shaft and rotated by the arm, a spring pressing the collar, and a connection between the collar and the valve-gear of the engine.

2. The combination with a Corliss engine, of a governor-disk mounted on the shaft of the engine, a governor-arm mounted to swing on the disk, a spring actuating the arm in one direction, an elbow-lever fulcrumed on the disk at the side bearing the arm, one arm of the elbow-lever projecting through the disk, a link connecting said arm of the elbow-lever with the governor-arm, a rod in connection with the other arm of the elbow-lever and projecting through the disk, a collar loose on the shaft and engaged by the arm, a spring pressing the collar, and means engaged with the collar for transmitting the movement thereof.

3. The combination with a Corliss engine, of a governor-disk mounted on the shaft of the engine, a governor-arm mounted to swing on the disk, a spring actuating the arm in one direction, an elbow-lever fulcrumed on the disk at the side bearing the arm, one arm of the elbow-lever projecting through the disk, a link connecting said arm of the elbow-lever with the governor-arm, a rod in connection with the other arm of the elbow-lever and projecting through the disk, a collar loose on the shaft and engaged by the arm, a spring pressing the collar, and means engaged with the collar for transmitting the movement thereof, said disk having ribs on the side bearing the governor-arms, and the governor-arms engaging the ribs.

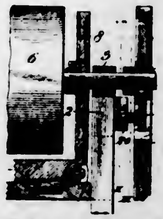
4. A governor comprising a wheel or disk having ribs extending along one side face thereof, governor-arms mounted on the wheel and arranged to slide against said ribs, weights attached to the governor-arms and located between the ribs, and means for transmitting the movement of the governor-arms.

812,631. **ETHER MIXTURE FOR DISINFECTING.** TOMÁS BARCIELA, JOSÉ P. MIELOWSKY, ALFREDO CARICCHIA, and LOUIS E. ODIO, Buenos Ayres, Argentina. Filed Jan. 20, 1904. Serial No. 189,876. (Specimens.)

Claim.—1. The aromatic and disinfecting compound of ethers and by-products, consisting of the distilled product of a mixture of eucalyptus-leaves and camphor in ethylic, methylic and amylic alcohol, hydrochloric acid, sea-salt, sulfuric acid and acetate of ammonia in or about the proportions described.

2. The aromatic and disinfecting compound of ethers and by-products, consisting of the distilled product of a mixture of eucalyptus-leaves and camphor in ethylic, methylic and amylic alcohol, hydrochloric acid, sea-salt, sulfuric acid, acetate of ammonia and binoxid of nitrogen, in or about the proportions described.

812,632. **TWO-REVOLUTION CYLINDER PRINTING-PRESS.** BENJAMIN F. BERRY, St. Louis, Mo., assignor to United Printing Machinery Company, Boston, Mass., a Corporation. Filed Dec. 17, 1904. Serial No. 237,194.



Claim.—1. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a driving member loosely associated with a spindle of said cylinder, a member fixed to said spindle and loosely fitted to said driving member, locking means adapted to connect said driving member and the member fixed to said spindle, and means for alternately shifting said locking means into and out of action, substantially as set forth.

2. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a driving member loosely associated with a spindle of said cylinder, a member fixed to said spindle and loosely fitted to said driving member, locking means adapted to connect said driving member and the member fixed to said spindle, and a cam with which said locking means engages to cause it to be shifted into locking action, substantially as set forth.

3. In a cylinder printing-press, the combination of a cylinder, a

bed adapted to move into driving connection with said cylinder, a driving member loosely associated with a spindle of said cylinder, a member fixed to said spindle and loosely fitted to said driving member, spring-controlled locking means adapted to connect said driving member and the member fixed to said spindle, and means whereby said locking means is shifted against the action of the springs controlling it, substantially as set forth.

4. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a driving member loosely associated with a spindle of said cylinder, a member fixed to said spindle and loosely fitted to said driving member, locking means adapted to connect said driving member and the member fixed to said spindle, and cams arranged to shift said locking means into locking action and out of locking action, substantially as set forth.

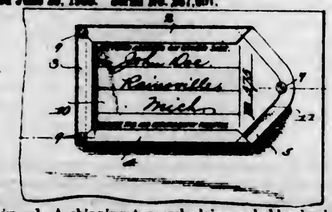
5. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a crank-arm fixed to a spindle of said cylinder, a loosely-mounted gear-wheel to which said crank-arm is loosely fitted, a locking member carried by said gear-wheel and adapted to engage said crank-arm to hold said crank-arm and gear-wheel rigidly united, and means for moving said locking member to free said gear-wheel from said crank-arm, substantially as set forth.

6. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a crank-arm fixed to a spindle of said cylinder, a loosely-mounted gear-wheel associated with said spindle and provided with an aperture adapted to receive said crank-arm, a locking member carried by said gear-wheel and adapted to engage said crank-arm, and means for moving said locking member to and away from said crank-arm, substantially as set forth.

7. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a crank-arm fixed to a spindle of said cylinder, a loosely-mounted gear-wheel associated with said spindle and provided with an aperture adapted to receive said crank-arm, a locking member carried by said gear-wheel and adapted to engage said crank-arm, and cams arranged to receive the engagement of said locking member to move it to and away from said crank-arm, substantially as set forth.

8. In a cylinder printing-press, the combination of a cylinder, a bed adapted to move into driving connection with said cylinder, a crank-arm fixed to a spindle of said cylinder and provided with a finger, a gear-wheel loosely associated with said spindle and provided with an aperture to receive said crank-arm finger that is of greater dimensions than said finger to permit freedom of movement of the finger therein, a spring-controlled locking member movably fitted to said gear-wheel and arranged for engagement with said crank-arm finger, and a cam located adjacent to said locking member arranged to be engaged by said locking member to move said member to said crank-arm finger, substantially as set forth.

812,683. SHIPPING-TAG. CALEB D. BRADHAM, Newbern, N. C. Filed June 20, 1905. Serial No. 267,691.



Claim.—1. A shipping-tag embodying a holder having marginal guides and an extension at one end provided with an orifice, and a tag adapted to engage the guides and provided at one end with an extension terminating in a notch in alinement with the orifice.

2. The combination with a receptacle of a holder provided with marginal guides and having at one end an extension provided with an orifice, an attaching device engaging the orifice, and a tag adapted to engage the guides and having one end provided with an extension having a notch to engage the attaching device.

3. The combination with a receptacle, of a holder having the name of the sender stamped thereon and provided with marginal guides and with a terminal extension having an orifice, an attaching device engaging the orifice, and a tag adapted to engage the guides and provided at one end with a reduced extension having a notch to engage the attaching device.

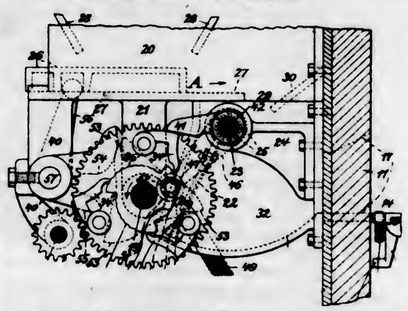
812,684. LABEL-HOLDER. DE WITT C. BROWN, American Falls, Idaho. Filed July 26, 1905. Serial No. 271,294.

Claim.—1. A label-holder formed of an integral length of wire, having a back composed of two runs of wire, an end wall or member composed of a U-shaped section of the wire, connecting the two parts of the back, and an opposite end wall or member formed of the extremities of said length of wire and projecting at an angle from the runs forming the back.

2. A label-holder having a concave-curved back and two end members projecting laterally from the concave side of the back and respectively adapted to engage and hold the ends of the labels, one of the end members extending at an acute angle to the back and being longer than the other whereby to feather out the labels at said end.

3. A label-holder having a concave-curved back and two end members projecting laterally from the concave side of the back and respectively adapted to engage and hold the ends of the labels, one of the end members extending at an acute angle to the back and being longer than the other whereby to feather out the labels at said ends, and said longer end member having means forming a shoulder at its inner side adapted to be engaged by the ends of the labels for the purpose specified.

812,685. MECHANICAL STOKER. JOHN A. CALDWELL, Montclair, N. J. Filed Feb. 15, 1905. Serial No. 245,667.



Claim.—1. In a mechanical stoker, the combination with a shovel, of a cam, a cam-tappet adapted to engage with said cam, mechanism interposed between said cam-tappet and the shovel for actuating said shovel, and differential means for producing movement of said cam-tappet with reference to the cam.

2. In a mechanical stoker, the combination with a shovel, of a cam, a cam-tappet, adapted to engage with said cam, mechanism interposed between said cam-tappet and the shovel for actuating said shovel, and differential means embodying a detachable gear-wheel for producing relative movements between said cam and said tappet.

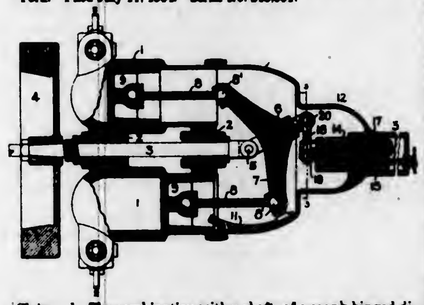
3. In a mechanical stoker, the combination with a shovel, of a shaft, a gear-wheel mounted on said shaft, a cam-tappet adjusted to revolve with said gear-wheel, a second gear-wheel mounted on said shaft, a cam adjusted to revolve with said second gear-wheel and adapted to engage with said cam-tappet, means interposed between said gear-wheels for imparting differential movement from the first to the second wheel, one of said gear-wheels being fixedly and the other being revolubly mounted upon said shaft, and means for imparting movement from said tappet to said shovel.

4. In a mechanical stoker, the combination with a shovel, of mechanism comprising a cam and a shovel-tappet and a shaft upon which said tappet and said shovel are mounted, and means for actuating said cam for imparting movement to said shovel-tappet, said tappet being constructed in sections adjustable in their relative positions.

5. In a mechanical stoker, the combination with a shovel, of mechanism comprising a cam, a shaft, and a shovel-tappet mounted upon said shaft and adapted to receive movement from such cam for actuating said shovel, said tappet being constructed in sections provided with serrated surfaces engaging with each other, and means for varying the relative positions of said serrated surfaces.

6. The combination with a furnace, of an oscillating shovel, means for actuating said shovel, the free edge of the shovel being provided with teeth extending at different angles with respect to the face of the shovel.

812,686. VARIABLE-STROKE CRANK. JOHN G. CALLAN, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed July 11, 1904. Serial No. 215,991.



Claim.—1. The combination with a shaft, of a crank hinged directly thereto, means for actuating said crank, and means for bodily moving the shaft to vary the angle between the said crank and the axis of the shaft.

2. The combination of two rotating shafts, a third shaft hinged to one of them and imparting rotation thereto, and a connecting member hinged to the other rotating shaft and the third shaft, the axes of the hinged connections between the several parts being transverse to the axis of rotation of the shafts.

3. The combination with a crank-shaft, of a crank hinged thereto, means for actuating said crank comprising a member rotating in a given plane, a rotating shaft hinged thereto and axially alining with the crank-shaft, and means for moving said crank-shaft longitudinally, in a line perpendicular to said plane.

4. The combination with a rotating shaft, of a crank hinged thereto, a member connected with said crank and rotating in a plane perpendicular to the axis of the shaft, a slide in which said crank-shaft is journaled, a bearing for the slide and shaft, and means for reciprocating said slide in the bearing to move the shaft longitudinally.

5. The combination in an engine comprising a wabbler, of a crank-shaft, a slide in which said shaft is journaled, and with which the latter is longitudinally movable, and a crank hinged to said shaft and connected with the wabbler.

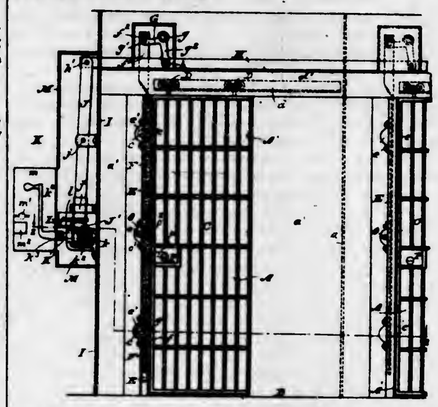
6. The combination in an engine comprising a wabbler, of a shaft journaled in the hub of the wabbler, and relatively rotatable therein, a crank-shaft, a slide in which said crank-shaft is journaled, and a crank hinged directly to the crank-shaft and to the wabbler-shaft.

7. The combination of two rotating and axially-alining shafts, a third shaft hinged to one of them and adapted to drive the same, a crank hinged to the other rotating shaft and to the third shaft, and a means for adjusting the relative position of the rotating shafts to change the relation between the crank and the third shaft.

812,687. PRISON-DOOR-LOCKING MECHANISM. GEORGE J. CARTER, Kenton, Ohio. Filed July 27, 1904. Serial No. 218,261.

Claim.—1. The combination of a cell-door having locking mechanism, a vertical bar adapted to engage with said locking mechanism, a cross-pin on said bar with a bell-crank lever having one arm vertically slotted to engage said cross-pin and a master-bar for a series of doors connected to the other arm of the lever, substantially as described.

2. The combination of a cell-door having rigid latch-hooks, a jamb-box apertured for the reception of said hooks, a vertically-movable lock-bar located in said jamb-box and having apertures adapted to engage the latch-hooks the upper end of the bar extending out of the jamb-box, a cross-pin on the upper end of the bar and a bell-crank lever having one arm vertically slotted to engage said cross-pin, a master-bar connected to the other arm of the bell-crank, with a key-lock on the jamb-box having a rotatable barrel with a toothed segment and a rack on the lock-bar engaged by said segment, substantially as described.



3. The combination of a cell-door having rigid latch-hooks, a jamb-box apertured for the reception of said hooks, a vertically-movable bar in the jamb-box apertured to engage said hooks, a dead-lock on the door having a hooked latch adapted to engage an aperture in the jamb-box and a slot in the lock-bar of such length that the movement of the bar will not actuate the hooked latch of the dead-lock, substantially as described.

812,688. TRANSFERRING APPARATUS. ALBERT M. CATHEY, Davidson, N. C. Filed Dec. 12, 1905. Serial No. 291,457.

Claim.—1. In an apparatus of the class described, a carriage, rollers for supporting the carriage and free thereof combined with mechanism for transferring rollers from one point to another.

2. In an apparatus of the class described, a carriage, rollers for supporting the carriage and free thereof combined with mechanism for transferring the rollers from one end of the carriage to the other end thereof.

3. In an apparatus of the class described, a runway, rollers on the runway, a carriage supported by and free of the rollers, and mechanism for transferring the rollers from one point on the runway to another point.

4. In an apparatus of the class described, a carriage, rollers for supporting the carriage and free thereof, parallel grooved rails to receive the rollers, and mechanism for lifting the rollers from off the rails when the carriage has passed from off the same and for returning the rollers to a point in front of the carriage.

5. In an apparatus of the class described, a carriage, rollers for supporting and free of the carriage, and mechanism for elevating the rollers when the carriage has passed from off the same and returning the rollers to a point in front of the carriage.

6. In an apparatus of the class described, a carriage having parallel grooved stringers, parallel grooved rails, rollers movable freely in the grooves of the respective parts, and means for lifting the rollers from off the rails when the carriage has passed thereover and for returning said rollers to a point in front of the carriage.

7. In an apparatus of the class described, a carriage, rollers for supporting the carriage and free thereof, means for lifting the rollers when the carriage has passed from off the same, and an inclined way onto which the rollers are delivered by the elevating means, for conducting said rollers to the front of the carriage.

8. In an apparatus of the class described, a carriage, rollers for supporting and free of the carriage, elevating means at the opposite ends of the carriage for lifting the rollers from their normal level, members along which the rollers travel when under the action of the elevating means, and a tiltable member adapted to assume opposite inclinations and to coöperate alternately with said members, whereby rollers received from the latter can gravitate therealong.

812,639. **PROCESS OF MAKING STIFFENING MATERIAL.** CHARLES H. CHESEMAN, Burlington, N. J. Filed May 17, 1905. Serial No. 260,579.

Claim.—1. The herein-described process of making stiffening material which consists in heating water to the boiling-point, then adding dextrine, then adding glue, cooling the mixture and then adding water thereto.

2. The herein-described process of making stiffening material which consists in heating water to the boiling-point, then adding dextrine and allowing the mixture to cook until the dextrine is dissolved, then adding glue, cooling the mixture, then reheating the mixture and then adding water to thin the mixture.

3. The herein-described process of making stiffening material consisting of heating water to the boiling-point, then adding dextrine and allowing the mixture to cook until the dextrine is dissolved, then adding ground glue and heating the mixture until it comes to a boil, while the mixture is boiling add alum, then allowing the mixture to cool, then reheating the mixture until it is in a condition to flow and then adding water to thin the mixture.

4. A new process of making stiffening material, which consists in heating water to the boiling-point, then adding dextrine, then adding glue and then allowing the mixture to cool.

5. As steps in a process of making stiffening material, heating water to the boiling-point, adding dextrine, adding glue, adding alum, and allowing the mixture to cool.

6. A new process of making stiffening material, which consists in heating water to the boiling-point, adding dextrine, and then adding glue.

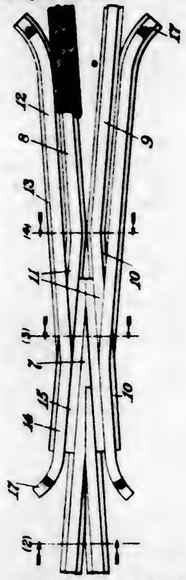
812,640. **RAILWAY SWITCH AND CROSSING FROG.** JOHN B. COURLEY, Arcola, Ill. Filed Aug. 24, 1905. Serial No. 275,383.

Claim.—1. A railway frog having means to support the tread of the wheel throughout the entire distance and to engage the rim of the wheel tread to guide and confine it to position, substantially as described.

2. The combination with the rail point 7 and the straddling rails 8 and 9, of the spliced guard rails 12 provided with a head and arranged to engage the rim or tread of the wheel to confine it to position, substantially as described.

3. In a railway frog, the combination with the rails 8, 9, flared and having their heads cut off beyond the frog point, of the guard rails 12 having the flanges cut off beyond the frog point and spliced to the first mentioned rails, as, and for the purpose described.

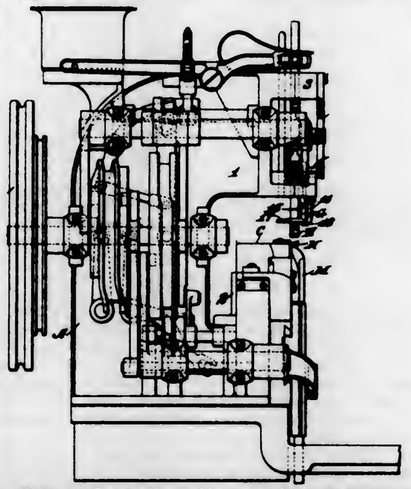
4. In a railway crossing, the combination with the spliced point 7 of the meeting rails 5, 6, of the straddling rails 8, 9, having their heads cut off beyond said point, and the guard rails 12 having their flanges cut off and spliced upon the said straddling rails, whereby the said guide rail heads directly join the heads of the supporting rails 8, 9, substantially as described.



5. In a railway crossing, the combination with the meeting rails and the straddling rails 8 and 9 flared and enveloping the same, and spliced upon the narrow straddling portions to a supplementary rail 12 continuing as guard rails beyond the meeting point, substantially as described.

6. In a railway frog, the combination with a supporting rail having its head removed where it laps over the frog point, of a guard rail having its flange removed in part and spliced on the said supporting rail beyond said frog point, substantially as described.

812,641. **SEWING-MACHINE.** GEORGE L. CONCORAN and GEORGE A. DOSTER, St. Louis, Mo., assignors to Champion Shoe Machinery Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 11, 1905. Serial No. 273,773.



Claim.—1. In a sewing-machine, a shuttle in combination with a loop-opener, a loop-spreader having its end normally adjacent the end of the loop-opener, means for causing said opener and spreader to move into position to engage a strand of thread and thereafter recede from such position, and means for moving said loop-opener in a vertical plane relatively to the loop-opener for carrying it out of the path of movement of the shuttle; substantially as described.

2. In a sewing-machine, a shuttle in combination with a loop-opener, a loop-spreader, means for causing said opener and spreader to penetrate a loop formed in a strand of thread, means for thereafter moving the spreader relatively to the opener for spreading the loop, and means for moving said spreader in a vertical plane relatively to the opener to carry it out of the path of movement of the shuttle; substantially as described.

3. In a sewing-machine, a shuttle, a frame carrying a loop-opener, a support movably mounted on said frame, a loop-spreader oscillatingly mounted on said support and normally occupying a position with its end engaging the end of the loop-opener, means for moving said frame to cause said loop-opener and loop-spreader to enter a loop formed in a strand of thread, means for actuating said support to cause the spreader to spread said loop, and means for oscillating said spreader relatively to the loop-opener for carrying it out of the path of movement of the shuttle; substantially as described.

4. In a sewing-machine, a frame carrying a loop-opener, a slide mounted in said frame and having a loop-spreader pivotally connected thereto, an enlarged head on said loop-spreader, offsets formed in said frame, means for moving said frame laterally, and means for reciprocating said slide relatively to said frame whereby said offsets coöperate with the head on the loop-spreader for moving the same; substantially as described.

5. In a sewing-machine, a shuttle, a needle for forming a loop in a strand of thread, a loop-opener having a passage-way adapted to be entered by the barbed end of said needle, a loop-spreader, means for actuating said opener and said spreader to cause them to enter said loop, means for actuating said spreader to spread the loop, means for moving said spreader in a vertical plane relatively to the opener to carry it out of the path of movement of the shuttle, and means for actuating said shuttle to cause its point to enter said loop and carry the thread away from the needle to complete the formation of the stitch; substantially as described.

6. In a sewing-machine, a shuttle in combination with a loop-opener, a spreader, means for causing said parts to move forwardly into a loop formed in a strand of thread, means for causing said spreader to move in an upward direction out of the path of movement of the shuttle and thence in a direction away from the loop-opener to spread the loop, and then in a direction toward the loop-opener to carry it back to normal position; substantially as described.

7. In a sewing-machine, the combination with complementary mechanism including shafts, of a slidable support carrying a movable loop-spreader, a lever operatively connected to said support, a second lever connected to said first-mentioned lever, means for operating the second-mentioned lever to impart movement to said support, means for returning said second-mentioned lever to normal position, a guide in which said slidable support is adapted to move, a loop-opener carried by said guide, and offsets in said guide to contact with said loop-spreader to tilt the same at an angle to its sliding movement; substantially as described.

8. In a sewing-machine, the combination with a needle having a barb, of pivotally-supported thread-engaging members for laying the thread in engagement with said barb, rock-plates provided with slots having cam projections on the edges thereof, said cam projections on one plate being differently arranged from those on the other plate, connections between said rock-plates and said tread-engaging members, a movable actuating member having means that enter the slots in both of said plates whereby they are operated for causing the thread to be laid in engagement with the barb of the needle without pulling it, a loop-opener and a loop-spreader adapted to enter a loop in the thread, means for actuating said opener and spreader to spread the loop for the entrance of a shuttle, and means for oscillating the loop-spreader to carry it out of the path of the shuttle; substantially as described.

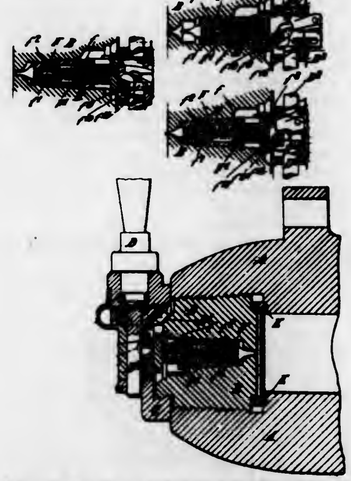
812,642. **UNION-COUPLING.** HERBERT S. CROSBIE, Woburn, Mass. Filed Oct. 6, 1904. Serial No. 227,479.

Claim.—1. A pipe-coupling comprising two opposing members, one of which is provided with an annular packing seat or chamber formed in the end thereof adjacent to said other member and opening into the interior bore thereof, said chamber having at the bottom thereof an annular wedge-shaped rib, a metal packing-ring located in said chamber, its inner periphery forming a portion of the interior bore of said coupling, and means for coupling said members together, whereby said packing-ring is forced into said chamber and against said rib.

2. A pipe-coupling comprising two opposing members, and means for coupling said members together, whereby they are permitted to move independently of each other in the arc of a circle, one of said members provided with an annular packing seat or chamber formed in the end thereof adjacent to said other member and opening into the interior bore thereof, said chamber having at the bottom thereof an annular wedge-shaped rib, a metal packing-ring located in said chamber, its inner periphery forming a portion of the interior bore of said coupling, and means for coupling said members together, whereby said packing-ring is forced into said chamber and against said rib.

3. A pipe-coupling comprising two opposing members, one of which is provided with an annular seat or chamber formed in the end thereof adjacent to said other member and opening into the interior bore thereof, said chamber having at the bottom thereof an annular wedge-shaped rib, having a sharp cutting edge, a packing-ring formed of softer metal than said rib, located in said chamber, its periphery forming a portion of the interior bore of said coupling, and means for coupling said members together, whereby said packing-ring is forced into said chamber and said rib is forced into said packing-ring.

812,643. **BREECH MECHANISM OF ORDNANCE.** ARTHUR T. DAWSON and GEORGE T. BUCKHAM, Westminster, London, England, assignors to Vickers Sons & Maxim Limited, Westminster, England. Filed Sept. 30, 1904. Serial No. 226,691.



Claim.—1. In firing-gear for breech-loading guns, the combination with the spring-controlled striker, of means for imparting additional compression to the striker-spring beyond that which it receives by the retraction of the striker during cocking, means for enabling said additional compression to react after firing and retract said striker into its safety position, and means for temporarily locking said striker in this position during the traveling of the gun substantially as described.

2. In firing-gear for breech-loading guns, the combination with the spring-controlled striker, of a hinged slip-block thereon, an

actuating-shaft situated transversely with respect to the axis of said striker, a projection on said shaft coöperating with the slip-block for cocking and releasing the striker, a movable spring-case at the rear of the striker, a cam on said shaft coöperating with said spring-case for imparting additional compression to the striker-spring during retraction of the striker, and means for enabling said additional compression to react after firing and retract said striker into its safety position substantially as described.

3. In firing-gear for breech-loading guns, the combination with the spring-controlled striker, of a rearward extension thereon, a spring-controlled hinged slip-block on said extension, means for limiting the downward movement of said slip-block, an actuating-shaft situated transversely with respect to the axis of said striker, a projection on said shaft coöperating with the slip-block for cocking and releasing the striker, a movable spring-case at the rear of the striker, a cam on said shaft coöperating with said spring-case for imparting additional compression to the striker-spring during retraction of the striker, a loose block adjacent to said rearward extension of the striker, a pin thereon engaging with a slot in said rearward extension, and a cam-surface on said loose block with which when the actuating-shaft is released the cam on the actuating-shaft engages by the reaction of the compressed striker-spring and thereby shifts the loose block rearwardly and retracts the striker into its safety position, substantially as described.

4. In firing-gear for breech-loading guns, the combination with the spring-controlled striker, its slip-block and the actuating-shaft; of a firing-lever for operating said shaft, a firing-handle pivoted to the guard-plate of the gun-carriage and adapted to move in a plane parallel to the plane of movement of the striker for operating said firing-lever, and a spring for normally keeping said firing-handle in its inoperative position substantially as described.

5. In firing-gear for breech-loading guns, the combination with the spring-controlled striker, its slip-block and the actuating-shaft; of a firing-lever engaging with an arm on the actuating-shaft under the influence of a spring, a shaft situated parallel to the actuating-shaft and carrying said firing-lever and means for operating said firing-lever substantially as described.

6. In firing-gear for breech-loading guns, the combination with the spring-controlled striker, its slip-block and the actuating-shaft; of a firing-lever engaging with an arm on the actuating-shaft under the influence of a spring a shaft situated parallel to the actuating-shaft and carrying said firing-lever, a firing-handle pivoted to the guard-plate of the gun-carriage and adapted to move in a plane parallel to the plane of movement of the striker for operating said firing-lever, a spring for keeping said firing-handle in its inoperative position, and stops for limiting the extent of the movement of said firing-handle in either direction substantially as described.

7. In firing-gear for breech-loading guns, the combination with the spring-controlled striker and means for retracting the same; of a hinged catch angularly displaceable in a plane at right angles to the plane of movement of the striker, an eccentric projection on said catch adapted to be set into a position of engagement with or disengagement from a recess in the striker, and means for restraining said catch in either of its extreme positions substantially as and for the purpose specified.

812,644. **LUBRICATOR.** HENRY H. DOBBS, Buffalo, N. Y. Filed May 29, 1905. Serial No. 262,763.

Claim.—1. In a lubricating device, the combination of a plug having an oil-passage adapted to be connected at one end with a steam-chest and at its other end with an oil-supply pipe which is under boiler-pressure, and a check-valve in said passage arranged to open toward the steam-chest and incapable of closing in that direction, whereby oil is permitted to flow into the chest when the pressure is cut off from the same, said valve being constructed to completely cut off communication between said passage and the oil-supply pipe, when closed, substantially as set forth.

2. In a lubricating device, the combination of a plug having an oil-passage adapted to be connected at one end with a steam-chest and at its other end with an oil-supply pipe which is under boiler-pressure, a valve-case arranged in said passage and having a lateral port connecting the passage with the oil-pipe and a bottom port communicating with said passage, and a check-valve in said case arranged to close said lateral port under the back pressure in the steam-chest, said valve being incapable of closing toward the steam-chest and constructed to positively prevent the passage of steam from the chest to said supply-pipe, when closed, substantially as set forth.

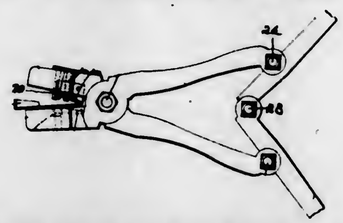
3. In a lubricating device, the combination of a plug having an oil-passage adapted to be connected at one end with a steam-chest and at its other end with an oil-supply pipe which is under boiler-pressure, a valve-case arranged in said passage and having a lateral port connecting the passage with the oil-pipe and lateral guide-slots, and a check-valve in said case controlling said port and having a tailpiece which engages said slots and is exposed to the pressure in said passage, the valve being incapable of closing toward the chest and constructed to completely cut off communication between the chest and the oil-pipe, when closed, substantially as set forth.

4. A device of the character described, comprising a plug having an oil-passage adapted to be connected with an oil-supply conduit, a tube arranged in said passage, and a check-valve applied to the lower end of said tube and arranged to close toward the same, said valve being constructed to completely cut of communication between the lubricated part and said supply-conduit, when closed, substantially as set forth.

5. A device of the character described, comprising a plug having an oil-passage adapted to be connected with an oil-supply conduit, a combining-tube arranged in said passage and having a downwardly-tapering bore, and a check-valve applied to the lower end of said combining-tube and arranged to close toward the same, said valve being constructed to completely cut off communication between the lubricated part and said supply-conduit, when closed, substantially as set forth.

6. A device of the character described, comprising a plug having an oil-passage adapted to be connected with an oil-supply conduit, a combining-tube arranged in an enlargement of said passage and having a downwardly-tapering bore, a valve-case depending from said tube and provided adjacent thereto with a lateral port or ports connecting said tube with said passage, and a check-valve arranged in said case and controlling said ports and having its lower end exposed to the steam-pressure in said passage, said valve being constructed to completely cut off communication between the lubricated part and said supply-conduit, when closed, substantially as set forth.

812,645. **COMBINED PUNCH AND SHEARS.** EDMUND E. GARDNER, Hamler, Ohio. Filed June 13, 1905. Serial No. 265,061.

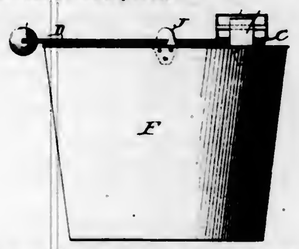


Claim.—In an implement of the class described, a jaw member having a die with a shear-face leading therefrom and continuing the same, an opposing jaw member having a punch for operating in said die and with a shear member for operating over said shear-face, pins operating loosely through said opposing jaw, a spring-plate attached to said opposing jaw and bearing upon said pins, and means for operating said jaws.

812,646. **CHEMICAL FIRE-PAIL.** CHARLES C. GILLESPIE, Chicago, Ill. Filed May 23, 1904. Serial No. 209,634.

Claim.—1. A device of the character described, comprising a primary receptacle provided with grooved means, an auxiliary receptacle provided with tenons engaging the grooved means of said primary receptacle, a weighted handle carried by said primary receptacle and provided with a rearward extension, said auxiliary receptacle provided with a hinged bottom, the extension of said handle adapted to engage said bottom and hold the same in a closed position.

2. A device of the character described, comprising a primary receptacle, a weighted handle provided with a rearward extension pivotally mounted upon said receptacle, a removable, auxiliary receptacle provided with a hinged bottom, carried by said primary receptacle, the rearward extension of said handle adapted to engage the horizontal bottom of said auxiliary receptacle for normally retaining the same in a closed position.



3. A device of the character described, comprising a primary receptacle, vertical, segmental members carried by said primary receptacle, each of said segmental members provided with a groove, a handle pivotally mounted upon said primary receptacle, a weight, constituting a grip, carried by said handle, said handle provided with a rearward extension, an auxiliary receptacle provided with a hinged top and bottom, tongues carried by the ends of said auxiliary receptacle, the tongues adapted to be positioned within the grooves of said segmental members for securing said auxiliary receptacle upon the primary receptacle, and the rearward extension of said handle adapted to normally hold the hinged bottom of said auxiliary receptacle in a closed position.

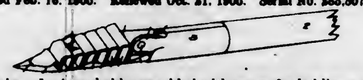
4. A device of the character described, comprising a primary receptacle, an auxiliary receptacle carried by said primary receptacle, said auxiliary receptacle provided with a hinged portion, and a handle carried by said primary receptacle adapted to engage said hinged portion for normally securing it in a closed position, said handle comprising a main body provided with integral, substantially parallel extensions, and a weight constituting a grip carried by said body.

5. A device of the character described, comprising a primary receptacle, a handle secured to said receptacle and by which the same is adapted to be handled, said handle provided with a rearward extension, an auxiliary receptacle supported upon said primary receptacle, and a hinged member carried by said auxiliary receptacle, the rearward extension of said handle adapted to normally hold said hinged member in a fixed position.

6. A device of the character described, comprising a primary receptacle, a handle secured to opposite sides of said receptacle, said handle provided with an extension, an auxiliary receptacle provided with a movable bottom carried by said auxiliary receptacle, said bottom adapted to be normally retained in its closed position by means of said extension of the handle.

7. A device of the character described, comprising a primary receptacle, a bail-handle provided with an extension carried by said primary receptacle, an auxiliary receptacle carried by said primary receptacle, and a movable closing member carried by said auxiliary receptacle, the extension of said handle adapted to engage said movable, closing member and normally hold the same in a closed position.

812,647. **RESERVOIR-PEN.** ROBERT T. GILLESPIE, Lisbon, Ohio. Filed Feb. 16, 1905. Renewed Oct. 21, 1905. Serial No. 283,807.



Claim.—1. A penholder provided with means for holding a pen-point, a pivoted lid provided on its under side with a series of cross doubled walls, intervening spaces adapted to hold the ink by capillary attraction and to form with the pen an ink-holding cavity, and a spring mounted in the interior of the holder adapted to exert pressure against the rear portion of the lid to hold it in a raised or lowered position, substantially as set forth.

2. A penholder provided with means for holding a pen-point, a pivoted lid provided on its under side with a series of cross doubled walls, intervening spaces adapted to hold the ink by capillary attraction and to form with the pen an ink-holding cavity, with a terminal tip having a feeding-groove on its under side, and a spring mounted in the interior of the holder adapted to exert pressure against the rear portion of the lid to hold it in a raised or lowered position, substantially as set forth.

3. A penholder provided with means for holding a pen-point, a pivoted lid provided on its under side with a series of cross doubled walls, a longitudinal channel formed by cutting through said walls transversely, intervening spaces adapted to hold the ink by capillary attraction and to form with the pen an ink-holding cavity, and a spring mounted in the interior of the holder adapted to exert pressure against the rear portion of the lid to hold it in a raised or lowered position, substantially as set forth.

4. The combination with a ferrule, of a pivoted lid formed of a sheet-metal blank doubled to provide a series of cross-walls and intervening apertures, substantially as set forth.

5. The combination with a ferrule, of a pivoted lid formed of a sheet-metal blank doubled to provide a series of cross-walls and intervening apertures, with a terminal grooved tip, substantially as set forth.

6. The combination with a ferrule, of a pivoted lid formed of a sheet-metal blank doubled to provide a series of cross-walls and intervening apertures, a longitudinal channel formed by cutting through said cross-walls, with a terminal grooved tip, substantially as set forth.

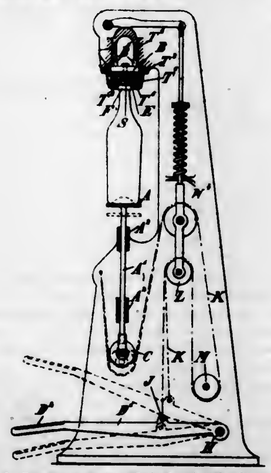
7. The combination with a ferrule, of a pivoted lid formed of a sheet-metal blank doubled to provide a series of cross-walls and intervening apertures, a longitudinal channel formed by cutting through said cross-walls, and a terminal grooved tip, with a spring mounted in the ferrule adapted to bear against the rear end of the lid to hold it in a raised or lowered position, substantially as set forth.

8. The combination with a ferrule, of a pivoted lid formed of a sheet-metal blank doubled to provide a series of cross-walls and intervening apertures, a longitudinal channel formed by cutting through said cross-walls, and a terminal grooved tip, and provided with a projecting lifting finger-piece, substantially as set forth.

9. A ferrule consisting of a sheet-metal blank bent into cylindrical form, provided with lateral inwardly-turned wings at its front portion adapted to form an interior ferrule with an intervening pen-holding space, and doubled lid-pivoting cheeks projecting from said front portion, substantially as set forth.

10. A ferrule consisting of a sheet-metal blank bent into cylindrical form, provided with lateral inwardly-turned wings at its front portion providing an interior ferrule with an intervening pen-holding space, and providing inner and outer extremities, one of which projects beyond the other, with doubled lid-pivoting cheeks, substantially as set forth.

812,648. **APPARATUS FOR CLOSING BOTTLES BY MEANS OF METAL CAPSULES.** EWALD GOLDSTEIN, Cologne, Germany. Filed May 23, 1904. Serial No. 209,404.



Claim.—1. In an apparatus of closing bottles by means of metal capsules and washers, the combination of a vertically-movable bottle-holding means, a fixed stamp or abutment against which the capsule and washer are placed, a compressible elastic element disposed

around the lower portion of the fixed stamp or abutment, a displaceable crosch movable over and around the stamp or abutment and compressing said elastic element, substantially as described.

2. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, substantially as described.

3. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, substantially as described.

4. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, substantially as described.

5. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, the hanger having a loop at its upper end, substantially as described.

6. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, the hanger having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, substantially as described.

7. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, the hanger having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, the hanger-bracket having a loop at its upper end, substantially as described.

8. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, the hanger having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, the hanger-bracket having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, substantially as described.

9. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, the hanger having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, the hanger-bracket having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, the hanger-bracket having a loop at its upper end, substantially as described.

10. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails and corner-pieces having inwardly-projecting flanges, and a wire-cloth panel secured between said flanges, the top flange having a centrally-located opening, and a hook-shaped hanger secured to the top rail and projecting through said opening, the hanger having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, the hanger-bracket having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, the hanger-bracket having a loop at its upper end, and a hook-shaped hanger-bracket secured to the top rail and projecting through said opening, substantially as described.

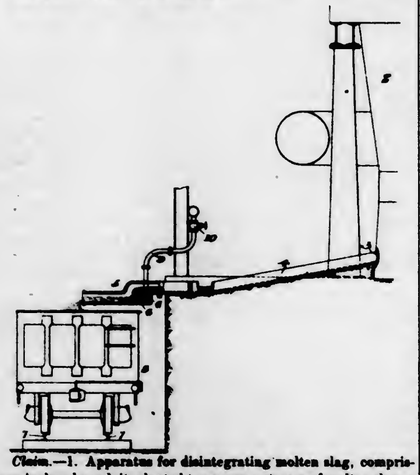
around the lower portion of the fixed stamp or abutment, a displaceable punch movable over and around the stamp or abutment and engaging the compressible element, a lever for operating both the bottle-holding means and the displaceable punch, a flexible connection and pulleys interposed between the lever and the bottle-holding means and punch, and means for preventing a premature operation of the punch.

2. In an apparatus for closing bottles by means of metal capsules and disks, the combination of a vertically-movable bottle-holding means, a fixed stamp or abutment against which the capsule and washer are placed, a compressible elastic element having a portion thereof below the stamp or abutment and exerting an inward pressure when operated against the capsule-rim, a displaceable punch movable over the stamp and abutment and in engagement with the compressible element, and mechanism for operating the bottle-holding means and displaceable punch in timed relation.

812,649. **HAME-FASTENER.** GLENN G. GREENE, Warren, Pa. Filed Sept. 20, 1905. Serial No. 279,055.

Claim.—A hame-fastener comprising a lever formed with spaced sides, a link pivoted at one end to one end of said lever and foldable between the spaced sides of the same, an arm formed with spaced sides and pivoted at one end to the spaced sides of said lever, and a flexible element and a hook movably coupled respectively to said link and to said arm, and a hook adjustably connected to said flexible element.

812,650. **APPARATUS FOR MAKING ARTIFICIAL SAND.** GEORGE K. HANFELDT, Munhall, and DAVID CURRAGH, Swissvale, Pa. Filed Nov. 11, 1904. Serial No. 232,311.



Claim.—1. Apparatus for disintegrating molten slag, comprising an inclosed conduit adapted to convey a stream of molten slag, a water-supply, and means for directing a stream of water into contact with the slag within said conduit, the walls of the conduit being arranged to receive the impact of the slag when thrown laterally outward; substantially as described.

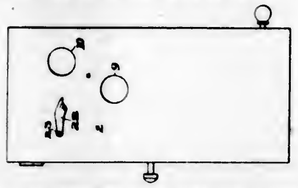
2. Apparatus for disintegrating molten slag, comprising an inclosed conduit adapted to convey a stream of molten slag, a water-supply, and means for directing a stream of water toward the outlet of said conduit and into contact with the slag within said conduit, the walls of the conduit being arranged to receive the impact of the slag when thrown laterally outward; substantially as described.

3. Apparatus for disintegrating molten slag, comprising an inclosed conduit for the slag, a water-supply, and means for directing an annular stream of water into contact with the slag within said conduit, the walls of the conduit being arranged to receive the impact of the slag when thrown laterally outward; substantially as described.

4. Apparatus for disintegrating molten slag, comprising an inclosed conduit adapted to convey a stream of molten slag, a water-supply, and means carried by the walls for directing a stream of water into contact with the slag within said conduit, the walls of the conduit being arranged to receive the impact of the slag when thrown laterally outward; substantially as described.

5. Apparatus for disintegrating molten slag, comprising an inclosed conduit for the slag, a water-supply, and means for directing a stream of water into contact with the slag within said conduit, the walls of the conduit being arranged to receive the impact of the slag when thrown laterally outward, the end of the conduit being arranged to discharge the disintegrated slag into a car, substantially as described.

812,651. **TOY OR DISPLAY DEVICE.** ROBERT H. HARTLEY, Pittsburg, Pa. Filed Jan. 21, 1905. Serial No. 242,080.



Claim.—1. An amusement device, comprising a casing having a question-opening and an answer-opening, a shutter closing at least one of said openings, a coin-receiver connected to the shutter device and arranged to tilt it to a lower position when the coin is inserted, and means coöperating with the receiver in its lower position to hold the coin; substantially as described.

2. An amusement device comprising a casing for a question-opening and an answer-opening, a web of flexible material having suitable questions and answers thereon arranged to register with said openings, a shutter device arranged to alternately open said apertures, means for holding the shutter device in one position, and means for tilting it in another position when a coin or weight is inserted; substantially as described.

3. In an amusement device a casing for question and answer openings, a pair of shutters arranged to alternately close said openings, a weight arranged to normally hold the shutters in one position, and a coin or weight receiver arranged to tilt the shutters to another position when the coin or weight is inserted; substantially as described.

4. In an amusement device a casing for question and answer openings, a pair of shutters arranged to alternately close said openings, a weight arranged to normally hold the shutters in one position, a coin or weight receiver arranged to tilt the shutters to a lower position when the coin or weight is inserted, and a hand-operated device arranged to coact with the receiver when in lower tilted position to hold the coin; substantially as described.

5. An amusement device comprising a casing having question and answer openings, means for alternately opening and closing said openings, and a pointer or hand device arranged to automatically tilt toward the opening which is opened; substantially as described.

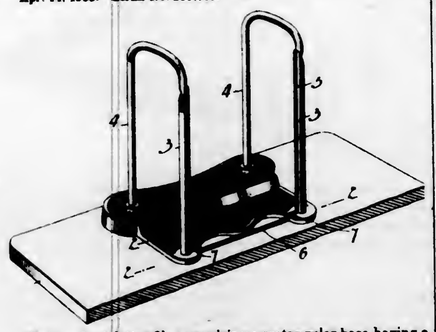
6. An amusement device comprising a casing having question and answer openings, a tilting shutter device having doors arranged to close said apertures alternately, a weight or its equivalent arranged to normally hold the shutter device in one position, and a coin-receiver connected to the shutter device and arranged to tilt it when the coin or weight is inserted.

7. An amusement device comprising a casing having question and answer openings, a tilting shutter device having doors arranged to close one aperture when the other is open, a weight or its equivalent arranged to normally hold the shutter device in one position, a coin-receiver connected to the shutter device and arranged to tilt it to a lower position when the coin or weight is inserted, and a yieldingly-pressed hand-operated holder arranged to coöperate with the coin-receiver for retaining the coin in its lower position; substantially as described.

812,652. **SPOUT FOR GATHERING TURPENTINE.** JAMES I. HATFIELD, Douglas, Ga. Filed Nov. 10, 1905. Serial No. 286,707.

Claim.—A spout for gathering turpentine made up from a single piece of sheet metal, which is shaped to provide a top kerf-flange and converging side flanges, the top flange having a centrally-located dividing-slit which extends into the upper portion of the front of the spout, whereby the blank may be bent to provide an angularly-disposed kerf-flange and a curved part below the flange which terminates in an outward-extending discharge portion, substantially as shown.

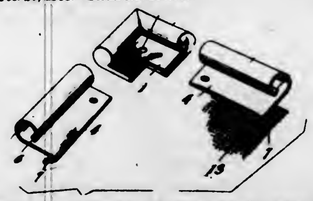
812,653. **LETTER-FILE.** CLARA C. HEID, Juneau, Alaska. Filed Apr. 14, 1905. Serial No. 255,668.



Claim.—1. A letter-file comprising a rectangular base having a transverse slot extending through the same, a plate fastened on the base at the one end thereof and having circular openings and slots extending from said openings in vertical alinement with the base-slot, and vertical tubular pins secured in said openings and each having in its inner side a vertical slot in alinement with the base and plate-slots.

2. A letter-file comprising a rectangular base having a transverse slot extending through the same, a plate fastened on the base at one end thereof and having circular openings and slots extending from said openings in vertical alinement with the base-slot, vertical tubular pins secured in said openings and each having in its inner side a vertical slot in alinement with the base and plate slots, and transfer-wires coöperating with said pins.

812,654. **WINDOW-SCREEN.** CHARLES C. HIRSCH, Tripp, S. D. Filed Oct. 27, 1905. Serial No. 284,660.



Claim.—1. In combination, sheet-metal rails, means securing the meeting ends of the rails together, each rail having a netting-securing flange bent down to secure the netting, a sheet of netting having its edges bent under and gripped to the rails by said flanges, and a cross-bar between opposite rails having its ends bent to fit said flanges and bent down with the same.

2. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails formed of overlapping sections provided along their inner edges with longitudinal netting-securing flanges, netting extending over the outer faces of said flanges and having inturned edges extending along the inner faces of said flanges, said flanges being bent down tightly to the rails to grip said edges of the netting between the faces of the rails and the flanges and thereby tightly secure and stretch the netting across the opening of the completed frame, the flanges of the sections of each rail longitudinally overlapping, whereby the sections of a rail are rigidly locked together by closing down said flanges to stretch and fasten the netting substantially as described.

3. In combination, in a metal-frame screen, corner-pieces, metal rails overlapping and secured to the corner-pieces, said rails comprising longitudinally-overlapping sections provided along their inner edges with means for securing the netting thereto, and a cross-bar between opposite rails and secured to the inner edges thereof and formed of longitudinally-overlapping sections, substantially as described.

4. In combination, in a metal-frame screen, sheet-metal rails, means securing the same together at the corners of the frame, each rail along its inner edge having throughout the length thereof a longitudinal netting-securing flange extending back over the side face of the rail, and the netting having its edges doubled or bent back to form flanges to engage the inner surfaces of said netting-securing flanges, the netting extending over the outer faces of said flanges with said edges extending across the inner faces of said flanges, said flanges then being closed down to the side faces of the rails to stretch the netting and tightly grip said edges thereof between the rail-faces and said flanges, substantially as described.

5. As a new article of manufacture, a metal frame for screens adapted to be adjusted to the required dimensions before the netting is applied and fastened thereto, comprising rails each consisting of sheet-metal sections longitudinally and slidably overlapping, each section having a longitudinal bead or roll along the outer edge and a longitudinal netting-securing flange along the inner edge, said flange extending back at an angle over the side face of the section, said flanges of the sections of a rail overlapping and adapted to be closed down tightly over the faces of the sections to tightly lock the sections together and grip the edges of the netting between the flanges and the said faces of the sections, substantially as described.

6. A screen comprising a metal frame comprising longitudinally overlapping and telescoping sections having flanges along the inner edges thereof and pressed down to the faces thereof, and a netting stretched over the flanges and having its edges gripped beneath said flanges, said flanges locking said frame-sections rigidly together in the desired adjustment.

7. An adjustable metal frame for window-screens and the like, comprising similar telescoping sections along their inner edges having overlapping netting-gripping flanges adapted to be closed down on the body portion of the sections for clamping the netting to the frame and locking the sections together, substantially as described.

8. As a new article of manufacture, a metal frame for screens comprising rails formed of longitudinally and slidably overlapping sections, each section formed of sheet metal with a flat body portion along the inner edge having a netting-securing flange and along the outer edge having a hollow roll longitudinally open along the side face of the body portion, whereby the rolls of the sections longitudinally telescope and the body portions and flanges longitudinally overlap, substantially as described.

9. A metal frame for screens comprising corner-pieces each consisting of a plate having a bead along its outer edges, sheet-metal longitudinally overlapping and slidable sections each having a flat body portion with a netting-securing flange and a hollow roll, said sections longitudinally overlapping along their body portions with their rolls telescoping one within the other, the body portions of the end sections overlapping said corner-plates with the beads thereof extending longitudinally into the rolls of said sections, substantially as described.

812,655. **ROLLER-CHAIN FOR CONVEYERS.** ADOLPH JOHNSON, Battlecreek, Mich. Filed July 3, 1903. Renewed Dec. 22, 1905. Serial No. 293,967.

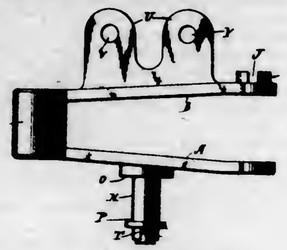
Claim.—In a roller-chain, the combination of a series of links each comprising two legs joined together at one end by an end piece provided with a transverse bore, the said legs being arranged side by side, the remaining ends of the legs having orifices and being separated and adapted to receive between them the end piece of another link, a pin passing through the said orifices in the legs of one link and

through the end piece of the next link disposed between those legs as

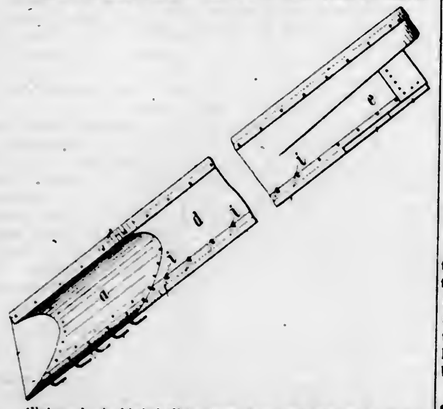
812,660. **ADJUSTABLE MIRROR-SUPPORT.** THOMAS G. LOVE-

ally mounted in said box and operating by gravity to close said slot

through the end piece of the next link disposed between those legs as described, means for securing the pin, one leg of each link having projecting lugs, and the other leg having a projecting spindle, and rollers revolubly upon the said spindles, each link having one of said rollers, as set forth.



812,656. CONSTRUCTION OF SHIP'S HULLS. JEAN B. I. A. JULHE, St. Mandé, France. Filed Feb. 7, 1905. Serial No. 244,607.

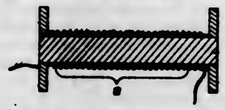


Claim.—1. A ship's hull having a bow in the form of a double moldboard of a width corresponding to that of the hull.

2. A ship's hull having a flat bottom provided with a plurality of keels, a platform extending across the front of said keels, and air-injectors carried by said platform.

3. A ship's hull having a flat bottom provided with a plurality of keels, a platform extending across the front ends of said keels, and rearwardly-disposed air-injecting tubes extending downwardly from said platform below said keels and directed rearwardly in line with the spaces or compartments between the latter.

812,657. ELECTRIC COIL. ISIDOR KITSEE, Philadelphia, Pa. Filed Sept. 10, 1904. Serial No. 224,008.



Claim.—1. The method of forming a coil useful for electric purposes which consists in forming out of uninsulated or bare wire a series of layers, each consisting of a series of convolutions, spacing the convolutions in a manner so as to prevent contact between the same, and insulating the different layers from each other through the interposition of layers of unvulcanized rubber or caoutchouc provided with the necessary vulcanizing material and then uniting the different layers through the process of vulcanization.

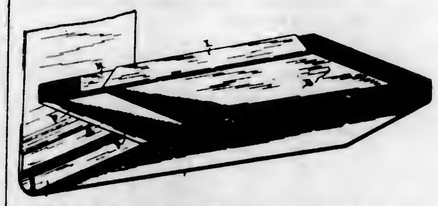
2. In the manufacture of coils useful for electric purposes, the process which consists in separating the different layers of wire, as they are produced, by layers of unvulcanized rubber containing its vulcanizing material, and then subjecting said layers of rubber and wire to the process of vulcanization, thereby uniting the rubber and wire to the process of vulcanization, thereby uniting the rubber and embedding therein the wire.

3. In the manufacture of electric coils wherein bare wire is employed to form said coil, the following steps, to wit: first, providing a support out of a layer of unvulcanized rubber; second, winding thereon uninsulated wire so as to produce a layer, the individual convolutions of which are separated by a space; third, covering said layer of wire with a layer of unvulcanized rubber, and multiplying said steps so as to produce a coil of required size, and finally subjecting the whole to a vulcanizing process whereby the different layers of unvulcanized rubber are united and form a substantial covering for the bare wire and whereby the former soft and unvulcanized rubber is converted into a hard rubber.

4. As a new article of manufacture, a block of vulcanized rubber provided with a series of spiral-like channels and a series of layers of metallic wires, each consisting of a series of convolutions incased in said channels.

5. As a new article of manufacture, a block of hard rubber having incased therein a series of layers of wire, each consisting of a series of convolutions, the layers and convolutions insulated from each other by parts of said hard rubber.

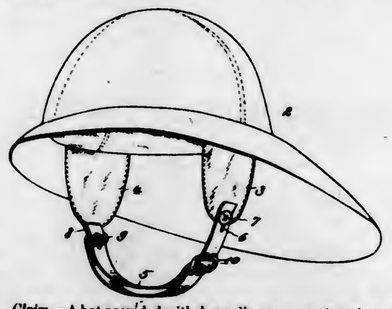
812,658. HOLDER FOR SALES-PADS. ASA E. LANDON, Canton, Pa., assignor to American Sales Book Company, Elmira, N. Y. Filed Nov. 8, 1905. Serial No. 286,415.



Claim.—1. The combination, with a pad of leaves having a fastening-strip at the back attached thereto in proximity to one edge of the pad, of a holder therefor comprising a back leaf having a turned-up portion along one edge, and a second leaf hinged to said back leaf and adapted to fold down upon it with one edge spaced from the turned-up portion, whereby, when the fastening-strip of the pad is hooked over said edge, the corresponding edge of the pad will be brought into engagement with said turned-up portion.

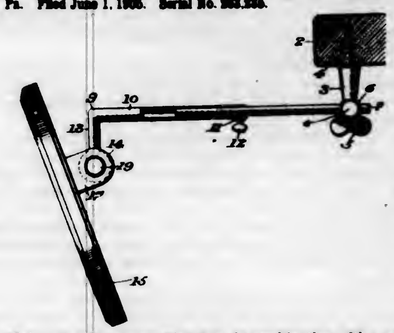
2. The combination, with a pad of leaves and a fastening-strip stapled together in proximity to one edge of the pad, of a holder therefor comprising a back leaf having a turned-up portion along one edge, and a second leaf hinged to said back leaf at right angles to the turned-up portion, the edge of the second leaf adjacent the turned-up portion being spaced therefrom for the purpose set forth.

812,659. HAT. GIDEON D. LORSCH, New York, N. Y., assignor to Standard Oiled Clothing Company. Filed Aug. 5, 1905. Serial No. 272,894.



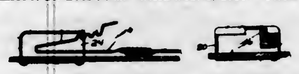
Claim.—A hat provided with depending ear-covering pieces, one of which has a button, the other being doubled on itself to produce a loop, a metallic loop connected with the other loop, a chin-strip having a buttonhole at one end to receive said button, and extended through said metallic loop, a slide provided with a cross-bar to which that end of the strip opposite the one having the buttonhole is permanently connected, the strip being extended between its ends through said slide

812,660. ADJUSTABLE MIRROR-SUPPORT. THOMAS O. LOVEGROVE, Philadelphia, Pa., assignor to Marshall A. Wood, Philadelphia, Pa. Filed June 1, 1905. Serial No. 263,286.



Claim.—A mirror-supporting arm, in combination with a post formed with a screw-stem, a boss, and a thumb-piece, said boss being provided with an opening therethrough, and a binding-screw at a right angle to said opening.

812,661. CARRIAGE-CURTAIN FASTENER. LAWRENCE J. LUCKHAUPT, St. Louis, Mo. Filed Feb. 6, 1905. Serial No. 244,483.



Claim.—In an improved carriage-curtain fastener, the combination with a curtain-frame member comprising a housing having an elongated opening in one end, and a lip extending downwardly from the top of the housing over said opening, of a narrow spring-tongue bent double and secured at one end to the curtain, and the free end of which tongue is provided with a series of transverse bends to form teeth for engaging the lip of the housing; substantially as specified.

812,662. MAIL-BOX. EDWIN T. MARSH, Rochester, N. Y. Filed Sept. 21, 1905. Serial No. 279,497.

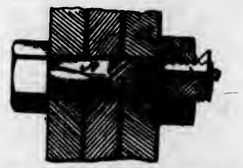
Claim.—1. A mail-box having a semicylindrical top in which is formed a normally closed mail-receiving slot, a combined segmental mail-receptacle and slot-closing device pivotally mounted in said top, said receptacle having formed therein a receiving-opening, hand-knobs connected to said receptacle whereby the same may be operated by hand to open said slot, and an operating-rod connected to said receptacle and extending downwardly in position to be engaged by the knee to open said slot, substantially as described.

2. A mail-box having a normally closed mail-receiving slot, a combined segmental mail-receptacle and slot-closing device pivotally mounted in said box and operating by gravity to close said slot, said receptacle having formed therein, a mail-receiving opening, hand-knobs secured to the pivots of said receptacle whereby the same may be operated, an operating-rod connected thereto and extending through the bottom of the box and a knob or head formed on the lower projecting end of said operating-rod, substantially as described.

3. A mail-box having a normally closed mail-receiving slot, a combined segmental mail-receptacle and slot-closing device pivotally mounted in said box and operating by gravity to close said slot, said receptacle having formed therein a mail-receiving opening, an inwardly-projecting stop-flange formed on the lower edge of said slot to limit the movement of said receptacle, means arranged on the top of the receptacle to receive the flanged lower edge of said slot, thereby forming, a water-tight closure for the same when the receptacle is in a lowered position, means whereby said receptacle is operated by hand, and means whereby the same is operated by the knee, substantially as described.

4. A mail-box having a normally closed mail-receiving slot, a combined segmental mail-receptacle and slot-closing device pivotally mounted in said box and operating by gravity to close said slot, said receptacle having formed therein a mail-receiving opening, an inwardly-projecting stop-flange or lip formed on the lower edge of said slot to limit the movement of said receptacle, protecting-strips arranged at the ends of said slot to cover the space between the ends of said receptacle and the ends of the box, a segmental plate secured to and at its outer edge spaced from the segmental top of said receptacle, a laterally-projecting strip arranged between the spaced edge of said plate and the segmental top of the receptacle, thereby forming a channel to receive the lower flanged edge of the mail-receiving slot in said box, hand-operating knobs connected with said receptacle, an operating-rod connected thereto and projecting through the bottom of the box, whereby the same may be operated by the knee, and a door to remove the mail from said box, substantially as described.

812,663. KEY-LOCK. ALFRED N. MASSIE, Belleville, Ill. Filed Mar. 3, 1905. Serial No. 248,126.



Claim.—1. In a nut-lock the combination with a bolt having a slot in the threaded end thereof, and a nut operating upon the bolt, of a locking member arranged within the slot and engaging the nut, and a split key having an angle portion that engages the inner end of the locking member.

2. In a nut-lock, the combination with a bolt having a slot in its threaded end, and a nut operating thereon, of a locking member arranged within the slot and having one face corrugated to fit the threads of the nut, said locking member having a head at one end which engages the face of the nut, and a split key which holds the locking member into engagement with the nut, said key having one end that engages the inner end of the locking member, for the purpose specified.

3. In a nut-lock, the combination with a bolt having a slot in its threaded end, and a nut operating upon said end, of a locking member adapted to be arranged within the slot and having a corrugated surface to fit the threads of the nut, one end of the said locking member having a head, and its opposite end beveled, and a split key having one end extending past its opposite end, and at an angle to the body portion for engagement with the bevel end of the locking member, for the purpose specified.

4. In a nut-lock, the combination with a bolt having a slot in the threaded end thereof, and a nut operating upon the bolt, of a locking member arranged within the slot and engaging the bolt, and a split key having an angle portion at one end that engages the inner end of the locking member, and an eye at its opposite end that engages the outer end of the said locking member.

812,664. TRANSMISSION-GEAR FOR MOTOR-VEHICLES. THEODORE P. MEINHARD, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Aug. 7, 1903. Serial No. 273,189.

Claim.—1. In a transmission-gear, the combination of a shaft, a gear member slidably mounted upon said shaft, a slide-rod extending through said shaft and having engagement with said gear member, and a rock-shaft having connection with said slide-rod, substantially as set forth.

2. In a transmission-gear, the combination of a shaft, a gear member slidably mounted upon said shaft, a slide-rod extending through said shaft and having engagement with said gear member,

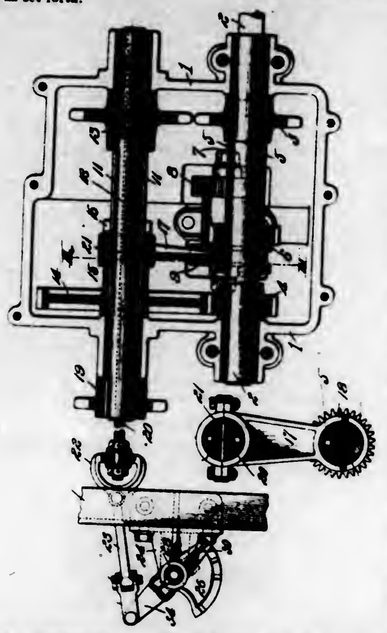
a rock-shaft having connection with said slide-rod, and means carried by said rock-shaft for holding it in adjusted positions, substantially as set forth.

4. A feeding device comprising a trough, a horizontally-hinged panel associated with the trough and flexible members connecting

Claim.—1. A building-block comprising two approximate parallel members having mortar-grooves formed on the inside of the end

6. The combination with a combustion-chamber having a closed top, of a fuel-chute leading through the top and arranged to discharge fuel to the central portion of the combustion-chamber, a

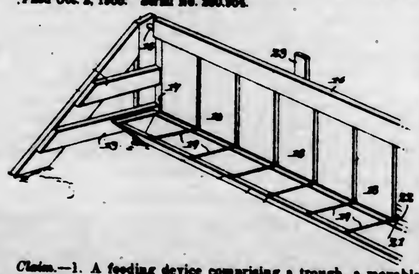
a rock-shaft having connection with said slide-rod, and means carried by said rock-shaft for holding it in adjusted positions, substantially as set forth.



3. In a transmission-gear, the combination of a shaft, a gear member slidably mounted upon said shaft, a slide-rod extending through said shaft and having connection with said gear member, a rock-shaft connected to said slide-rod, an arm carried by said rock-shaft for restraining it from rotation, and a spring for yieldingly holding said rock-shaft from longitudinal movement, substantially as set forth.

4. In a transmission-gear, the combination of a shaft, a gear member slidably mounted upon said shaft and a slide extending through said shaft and having connection with said gear member, a bracket, a rock-shaft connected to said slide-rod and mounted in said bracket, and an arm carried by said rock-shaft; said bracket being provided with a notched head to receive said arm and restrain said rock-shaft from rotation, substantially as set forth.

812,665. **FEEDING DEVICE.** JACOB C. MILLER, Greenwood, Ind. Filed Oct. 2, 1905. Serial No. 280,954.



Claim.—1. A feeding device comprising a trough, a movable panel associated with the trough and flexible members connecting the trough and panel.

2. A feeding device comprising a trough, a panel movable transversely of the trough and flexible members connecting the trough and panel.

3. A feeding device comprising a trough, a hinged panel associated with the trough and flexible members connecting the trough and panel.

4. A feeding device comprising a trough, a horizontally-hinged panel associated with the trough and flexible members connecting the trough and panel.

5. A feeding device comprising a trough, a horizontally-hinged panel movable transversely of the trough and flexible members connecting the trough and panel.

6. A feeding device comprising a fixed trough, a movable panel associated with the trough and flexible members connecting the trough and panel and arranged to limit the movement of the latter and to divide the trough into feeding-sections.

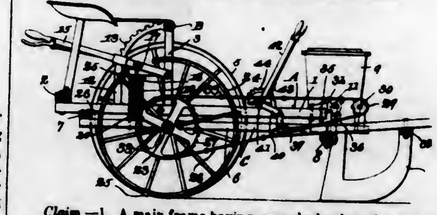
7. A feeding device comprising a fixed trough, a hinged panel movable transversely of the trough and flexible members connecting the trough and panel and extending transversely across and to divide the trough into feeding-sections and to limit the movement of the panel.

8. A feeding device comprising a fixed trough, a panel hinged above and movable transversely of the trough, and flexible members extending transversely across the trough and connecting the trough and panel.

9. A feeding device comprising a trough, a panel movable transversely of the trough, flexible members connecting the trough and panel, and means to secure the panel from inward movement over the trough.

10. A feeding device comprising a fixed trough, a panel hinged above and movable transversely of the trough, flexible members connecting the trough and panel, and a latch carried by the panel and movable into engagement with either side of the trough to prevent the panel swinging inward.

812,666. **CHECK-ROW CORN-PLANTER.** JOHN L. MILLER, Wood River, Nebr. Filed Dec. 4, 1905. Serial No. 290,267.



Claim.—1. A main frame having an arched axle and transporting-wheels upon the latter, uprights supported upon the side members of the frame and having rack-segments connected with the axle, levers pivoted upon the side members of the axle-arch and having stop members engaging the rack-segments, an auxiliary frame having an earth-engaging operating-wheel, and means including links connecting said auxiliary frame with the levers.

2. In a corn-planter, a main-wheel frame having an arched axle, an auxiliary frame, an axle supported for rotation in the auxiliary frame and having a ground-engaging operating-wheel, uprights supported in the side members of the main frame and having terminal segment-racks connected with the axle-arch, levers pivoted upon the side members of the latter and having stop members engaging the racks, links pivoted upon the levers and having plates at their free ends, springs coiled upon said levers and supported upon said plates, and means connected with the side members of the auxiliary frame and supported upon said springs.

3. In a corn-planter, a main frame having supporting-wheels, an auxiliary frame, an axle journaled in the auxiliary frame and having a ground-engaging wheel, hoppers and runners supported at the front end of the auxiliary frame, brackets connected with the main frame, an operating-shaft journaled in said brackets and extended into the hoppers, brackets connected with the auxiliary frame and having bearings for the operating-shaft, a tongue connected with the auxiliary frame, a rock-shaft supported upon the main frame and having an operating-lever and an arm, a link connecting said arm with the rear end of the tongue, means for securing the rock-shaft at various adjustments, independent means for effecting vertical adjustment of the rear end of the auxiliary frame including spring means for pressing the free end of said frame in a downward direction, and means for transmitting motion from the axle of the auxiliary frame to the operating-shaft.

812,667. **BUILDING-BLOCK.** WILLIAM D. MOORE, Creston, Iowa. Filed Dec. 9, 1904. Serial No. 236,903.

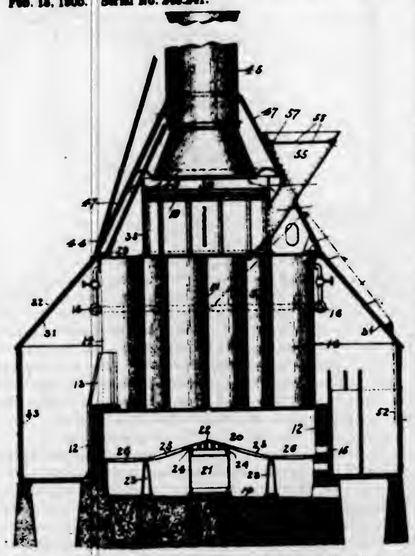
Claim.—1. A building-block comprising two approximate parallel members having mortar-grooves formed on the inside of the end portions thereof, and an oblique member connecting said parallel members.

2. An N-shaped building-block, having the notches thereof extending more than one-half the length of the block and being formed interiorly with undercut mortar-grooves.

3. A wall constructed of N-shaped blocks and corner-blocks, having notches adapted to register with the notches of the adjacent N-shaped blocks.

4. An N-shaped building-block having the extremities thereof decreasing in width toward their ends.

812,668. **POWER PLANT.** ROBERT MORAN, Seattle, Wash. Filed Feb. 18, 1905. Serial No. 246,241.



Claim.—1. The combination with a combustion-chamber, of a battery of boilers arranged closely together and forming an inclosing wall therefor, and a continuous fuel-supporting surface under all of the boilers.

2. The combination with a combustion-chamber, of a grate forming the bottom of the combustion-chamber, a battery of boilers arranged closely together and forming an inclosing wall for said chamber, and means for supporting the boilers above the level of the outer portion of the grate.

3. The combination with a combustion-chamber, of a grate forming the lower wall of the combustion-chamber, and inclining downward from a central point to the outer edge, a battery of boilers arranged closely together and forming the vertical wall of the combustion-chamber, and means for supporting the boilers above the grate.

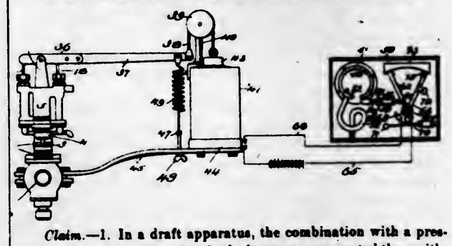
4. The combination with a combustion-chamber having a closed top, of a grate forming the bottom of the combustion-chamber, a battery of upright tubular boilers having their lower ends supported above the grate, an annular casing having a closed top forming a closure for the top of the combustion-chamber, and a stack with which the upper ends of said boilers communicate.

5. The combination with a combustion-chamber having a closed top, of a chute for discharging fuel to the central portion of the chamber, a grate forming the bottom of the combustion-chamber and having a raised central portion onto which the fuel falls and from whence it is deflected outward, and a battery of boilers arranged closely together and forming the outer wall of the combustion-chamber.

6. The combination with a combustion-chamber having a closed top, of a fuel-chute leading through the top and arranged to discharge fuel to the central portion of the combustion-chamber, a grate having a raised central portion on which the fuel falls, a battery of tubular boilers having their lower ends above the grate-surfaces, a closure for the top of the central portion of the combustion-chamber, and a stack with which the upper ends of the boilers communicate.

7. In a boiler plant, a vertical wall surrounding the ash-pit and lower portion of the combustion-chamber, a grate, a battery of boilers supported by said wall and forming the upper part of the wall of the combustion-chamber, a connected series of plates secured to the tops of the boilers, a vertical partition extended upward from the inner edges of the series of plates, a water-tank carried by said vertical partition, inclined struts extending upward from the outer line of the boilers, a stack supported by the struts at a point above the tank, and a casing, including a deflecting-hood, for directing the products of combustion over the edge of the tank, substantially as specified.

812,669. **FURNACE DRAFT-CONTROLLER.** WILLIAM MCCLAVE, Scranton, Pa., assignor to McClave-Brooks Company, a Corporation of Pennsylvania. Filed Nov. 3, 1904. Serial No. 231,261.



Claim.—1. In a draft apparatus, the combination with a pressure-gage and an electric circuit-closing means connected therewith, of an electric circuit including a magnet and a source of electrical energy, a lever adapted to be actuated by said magnet, a draft-controlling valve, a piston connected therewith for operating the same, a cylinder inclosing said piston, admission and exhaust valves for said cylinder and yieldable connections between said lever and said admission and exhaust valves.

2. In a draft apparatus, the combination with a draft-controlling valve, a piston connected therewith, a cylinder inclosing said piston, intake and exhaust valves for said cylinder, a lever for actuating said intake and exhaust valves, an electromagnet adapted to operate said lever, an electrical circuit including a source of electrical energy and said magnet, pivotally-mounted arms interposed in said circuit and adapted to be brought into contact for closing the circuit, one of said arms being formed with a segment at its lower end below the point of its pivot, a flat spring fixed in a substantially horizontal plane in position for having its flat face engage the periphery of said segment, and a pressure-gage adapted to swing the other arm into contact with the arm provided with a segment.

3. In a draft-controlling apparatus, the combination with means for governing the draft and electrical means for actuating said governing means, of a pivotally-mounted arm interposed in the circuit of said electrical means, a gage, and cushioning means connecting the gage with said arm for imparting movement from the gage to the arm for effecting a closure of said circuit upon a given movement of the arm.

4. In a draft-controlling apparatus, the combination with means for governing the draft and electrical means for actuating said governing means, of a pivotally-mounted arm interposed in the circuit of said electrical means, a gage spaced from said arm, a bar connected with said arm a bar engaging said gage, a sleeve inclosing the ends of said bars, a spring within said sleeve interposed between said bars for receiving the pressure from one of the bars for actuating the other for moving said arm in position for closing said circuit.

5. In a draft-controlling apparatus, the combination with means for governing the draft and electrical means for actuating said governing means, of a pivotally-mounted arm interposed in the circuit of said electrical means, a gage spaced from said arm, a bar pivotally connected with said gage, a bar pivotally connected with said arm, a sleeve surrounding the free ends of said bars, a plunger carried by one of said bars, an insulating-block carried by the other of said bars, said sleeve being slotted longitudinally, a pin extending from said plunger through said slot, and a spring interposed between said

plunger and insulating-block, whereby movement may be imparted from said gage to said arm for swinging the same into position for closing the said circuit.

6. In a draft-controlling apparatus, the combination with means for governing the draft and electrical means for actuating the same, of a pair of pivotally-mounted arms interposed in said circuit, a segment carried by one of said arms, a spring engaging the said segment for frictionally supporting the arm carrying the segment in any given adjusted position, a gage, and means connecting the same with the other of said arms for swinging the last-mentioned arm into contact with the segment-carrying arm for closing said circuit.

7. In a draft apparatus, the combination with a pressure-gage and an electric circuit-closing means connected therewith, of an electric circuit, adapted to be closed by said gage, including an electromagnet and a source of electrical energy, a draft-controlling valve, a piston connected therewith, a cylinder inclosing said piston, intake and exhaust valves for said cylinder, spring-arms connected with said valves, and means adapted to be actuated by said electromagnet for moving said arms for operating said intake and exhaust valves.

8. In a draft apparatus, the combination with a gage and an electric circuit-closing means connected therewith, of an electric circuit connected with said closing means, including a source of electrical energy and an electromagnet, a draft-controlling valve, a piston connected with said valve, a cylinder inclosing said piston, intake and exhaust valves for said cylinder and yielding operating means for said intake and exhaust valves adapted to be actuated by said magnet.

9. In a draft apparatus, the combination with a pressure-gage and an electric circuit-closing means, of an electric circuit connected with said closing means including an electromagnet and a source of electrical energy, a pivoted lever adapted to be actuated by said magnet and bifurcated at the point of its pivot, a draft-controlling valve, a piston connected therewith for operating the same, a cylinder inclosing said piston, intake and exhaust valves for said cylinder, and spring-arms carried within the bifurcation of said lever and connected to the lever and to said intake and exhaust valves for transmitting a cushioned movement from the lever to the valves.

10. In a draft apparatus, the combination with a draft-controlling valve, pressure-actuating means for operating the same, admission and exhaust valves for said pressure-actuating means, a lever for operating said admission and exhaust valves, an electromagnet adapted to operate said lever and an electrical circuit including said magnet and a source of electrical energy, a pair of arms pivotally mounted and interposed in said circuit, means frictionally resisting pivotal movement of one of said arms and a pressure-gage connected with the other of said arms for swinging the same into contact with the first-mentioned arm.

11. In a draft apparatus, the combination with a draft-controlling valve, a piston connected therewith, a cylinder inclosing said piston, intake and exhaust valves for said cylinder, a lever for actuating said intake and exhaust valves, an electromagnet adapted to actuate said lever, an electrical circuit including a source of electrical energy and said magnet, pivotally-mounted arms interposed in said circuit and adapted to be brought into contact for closing the circuit, one of said arms being formed with a segment, a spring-drag engaging the periphery of said segment for frictionally resisting pivotal movements of said arm and a pressure-gage adapted to swing the other arm into contact with the first-mentioned arm

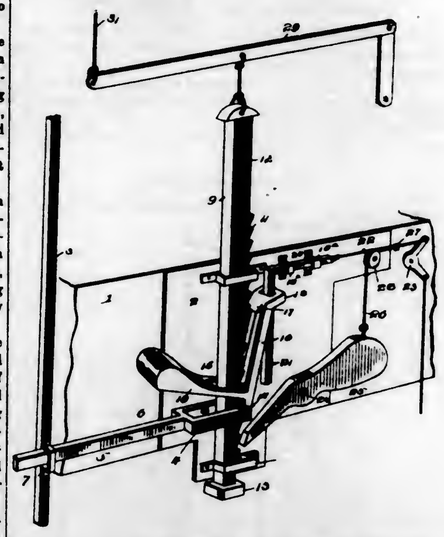
---

812,670. SPOOL-HOLDER. LEMUEL W. NEAR, Muskegon, Mich. Filed Apr. 14, 1905. Serial No. 255,574.

Claim.—1. An attachment to a spool-holder for sewing-machines, the same consisting of a hollow post adapted to be inserted over the spool-spindle, a vertical guard adapted to close the side opening of the spool and means for carrying the guard upon the post and for adjusting the guard to proper relation to the spool.

2. An attachment to a spool-holder for sewing-machines, the same consisting of a hollow post adapted to be inserted over the spool-spindle, a horizontal arm upon the hollow post and a depending guard carrying the thread-guide, and means for laterally adjusting the depending guard upon the horizontal arm.

812,671. WINDMILL-REGULATING MECHANISM. MELCHOR S. NEWCOMER, Polo, Ill. Filed July 6, 1904. Serial No. 215,544.



Claim.—1. A mechanism of the class described, comprising a lever, gripping means carried by said lever, a bar carrying a stop coacting with said gripping means, said bar being provided with a toothed portion extending approximately the entire length thereof, said toothed portion tapering from one end uniformly to its opposite end, locking means assembled with said lever and ratchet-bar, and means for controlling movement of said locking means.

2. A mechanism of the class described, comprising a support, a bifurcated lever pivoted to said support, a slotted pawl pivotally mounted upon said lever, a ratchet-bar movably mounted within said slotted pawl and bifurcated portion of said lever, locking means mounted upon said support and normally engaging said ratchet-bar, and means for causing movement of said locking means and pawl.

3. A mechanism of the class described, comprising a support, a lever pivotally mounted upon said support, a weighted pawl pivotally mounted upon said lever, a tapered ratchet-bar movably mounted upon said support and normally in engagement with said pawl, a lower weighted locking-pawl mounted upon said support, and means for synchronously causing movement of said pawls.

4. In a device of the character described, the combination with a support, of a plate secured thereto, an oscillatory lever secured to said plate, a weighted pawl pivotally mounted upon said lever, a ratchet-bar provided with a portion having teeth, mounted upon said support and normally in engagement with said lever and pawl, said toothed portion tapered throughout its length, locking means for said ratchet-bar, and means for controlling movement of said locking means and pawl.

5. A device of the character described, comprising a bifurcated oscillatory lever, a weighted pawl pivotally mounted upon said lever, a ratchet-bar provided with a reduced portion mounted upon said support within the bifurcated end of said lever, a weighted pawl pivotally mounted upon said support, guiding means secured to said support and normally in engagement with said pawl carried by the lever, and means connecting said guiding means with said pawl pivotally mounted upon said support.

6. In a device of the character described, the combination with a support, of an oscillatory lever pivotally mounted upon said support, said lever provided with a bifurcated end, a pawl pivotally mounted upon said bifurcated end, comprising a slotted body portion having a weighted extension and an apertured angular extension formed thereon, a ratchet-bar movably mounted within said slotted body portion of said pawl and within the bifurcated end of said lever, said ratchet-bar comprising a body portion provided with upper, flattened sides, a pivoted locking-pawl journaled upon said support and coacting with said ratchet-bar, movable guiding means mounted upon said support and engaging the apertured portion of said pawl mounted upon the lever, and means for moving said guiding means and locking-pawl.

7. In a device of the character described, the combination with a suitable support, of a lever pivotally mounted upon said support, said lever connected with a plunger, a weighted pawl mounted upon said lever, said pawl provided with an apertured extension formed at an angle to the body portion thereof, a ratchet-bar mounted upon said support and normally in engagement with said pawl, said ratchet-bar provided with a ratchet-surface formed upon one side thereof and with a smooth surface upon the upper portion of said bar, the lower portion of said bar reduced throughout its length, a slidable member provided with a right-angled extension projecting through said apertured portion of the pawl, a locking-pawl mounted upon said support and normally in engagement with said ratchet-bar, and means for causing movement of said locking-pawl and slidable member.

8. In a device of the character described, the combination with a support, of a bifurcated oscillatory lever mounted upon said support, a primary pawl pivotally mounted on the bifurcated portion of said lever, said primary pawl comprising a slotted portion having a right-angled weighted, slotted extension and an angular apertured extension, a guiding member movably mounted upon said support and normally engaging the apertured portion of said primary pawl, a ratchet-bar movably mounted upon said support and normally engaging said primary pawl and bifurcated lever, vane-connecting means secured to said ratchet-bar, and locking means for said ratchet-bar movably mounted upon said support.

9. In a device of the character described, the combination with a support, of a lever pivotally mounted upon said support, a pawl pivotally mounted upon said lever, weighted means secured to said pawl, tapered ratchet means movably mounted upon said support normally engaging the lever and pivoted pawl, a weighted pawl pivotally mounted upon said support near the lower reduced portion of the ratchet means, and means connected to said pawls and with a float for causing movement thereof.

10. A mechanism of the class described, comprising a support, a lever provided with a bifurcated end portion pivotally mounted upon said support, vane-connecting means secured to said support, gripping means pivotally mounted upon the bifurcated end of said lever and inclosing a portion of said vane-connecting means, guiding means coacting with said gripping means, locking means positioned upon said support for retaining said vane-connecting means in a fixed position, and means for controlling movement of said guiding and locking means.

11. A mechanism of the class described, comprising a support, a lever mounted upon said support, said lever comprising an approximately straight body portion provided at one end with parallel, integral extensions forming a bifurcated portion upon the lever, gripping means pivotally mounted upon the parallel extensions of said lever, vane-connecting means movably positioned within said gripping means, and locking means coacting with said gripping and vane-connecting means.

12. A mechanism of the class described, comprising a lever, a pawl pivotally mounted upon said lever, longitudinal movable guiding means connected with said pawl, vane-connecting means coacting with said pawl, locking means assembled with said lever and coacting with said vane-connecting means and pawl, and means for controlling movement of said guiding means, pawl, and locking means.

13. A mechanism of the class described, comprising a support, a lever mounted upon said support, said lever comprising a body portion provided with parallel, integral extensions, gripping means pivotally mounted upon the parallel extensions of the lever, vane-connecting means comprising a body, said body tapered uniformly throughout its length, said vane-connecting means removably positioned within said gripping means, and means for securing said vane-connecting means in an adjusted position.

14. A regulating mechanism of the class described, comprising an oscillatory member, a pawl movably mounted upon said member, movable guiding means connected with said pawl, vane-connecting means coacting with said pawl, locking means assembled with said member and coacting with said vane-connecting means for securing the same in an adjusted position, and means for governing movement of said guiding means, pawl, and locking means.

812,672. MACHINE FOR MEASURING AND CUTTING OFF LENGTHS OF FABRIC. JOSEPH B. O'BRYAN, Jr., and OTTO H. RUDOLPH, Nashville, Tenn. Filed Oct. 16, 1905. Serial No. 282,976.

Claim.—1. In a machine of the character described, the combination with an adjustable feed and guide, of a vertically-reciprocating rotary knife, and means for operating the same, substantially as described.

2. In a machine of the character described, the combination with an adjustable feed and guide, and an ejector therefor, of a vertically-reciprocating rotary knife and means for operating the same, substantially as described.

3. In a machine of the character described, the combination with an adjustable feed and guide, an ejector therefor, and an oscillating frame, of a vertically-reciprocating rotary knife, and means for operating the same, substantially as described.

4. In a machine of the character described, the combination with the feed-guideway, the feed-wheels operating therein, and an ejector, of an oscillating frame carrying a vertically-reciprocating rotary knife provided with means for giving the same a quick upward motion, and a downward slow motion, and means for operating the same, substantially as described.

5. In a machine of the character described, the combination with the feed mechanism, comprising a guideway having a flaring open mouth at each end, one or more feed-wheels slightly projecting above th bottom of said guideway, and an oscillating ejector adapted to project into the guideway, of a vertically-reciprocating rotary knife journaled in the open head of an oscillating frame, and means for operating said feed mechanism and the rotary knife, substantially as described.

6. In a machine of the character described, the combination with the feed mechanism, of an oscillating ejector having one end provided with a curved picker-finger, and the opposite end with a crank communicating with a similar crank on the end of the feed-mechanism shaft, by means of a connecting-rod, and means for operating said feed-mechanism shaft, substantially as described.

7. In a machine of the character described, an oscillating counterbalanced frame, having a centrally-located shaft provided with a pulley near its rear end, and with a bevel-gear at its opposite end adapted to mesh with a similar gear upon a shaft journaled in the head of the oscillating frame; said shaft carrying a vertically-reciprocating rotary knife upon its outer end, and said oscillating frame having an extension upon its forward end adapted to move in a slotted guideway, in combination with means for operating said oscillating frame and its rotary knife, substantially as described.

8. In a machine of the character described, the combination with the feed mechanism, the oscillating ejector and the vertically-reciprocating frame carrying the rotary knife, of the shafts arranged in line horizontally beneath the feed mechanism, and means for operating said shafts, substantially as described.

9. A machine of the character described, comprising a feed mechanism, a guideway and ejector operating in connection therewith, and a vertically-reciprocating rotary knife adapted to operate

---

in unison with the feed mechanism and ejector, and means for operating the several parts, substantially as described.

frame and arranged in direct longitudinal alinement with said rod.

slides mounted in said guide-brackets, links connecting said slides and said levers, springs for actuating said movable jaws in one di-

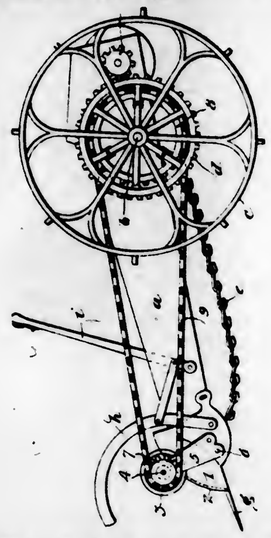
812,679. SURGICAL APPLIANCE. MATHIAS REHMANN, Valkenburg, Netherlands. Filed Feb. 5, 1904. Serial No. 192,944.

in unison with the feed mechanism and ejector, and means for operating the several parts, substantially as described.

812,673. POTATO-DIGGER. THOMAS N. OTUM, Lisbon, N. D. Filed June 20, 1905. Serial No. 265,638.

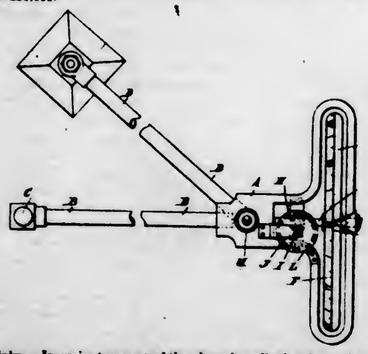


Claim.—1. A potato-digging-machine plow, having guard and cutter plates on opposite sides thereof, revolving colters coacting with said guard and cutter plates, and means to revolve the colters.

2. In combination with the plow of a potato-digging machine, fixed guard and cutter plates at the side thereof, brackets secured to the sides of the plow, a shaft having its bearings in said brackets, colters on said shaft, coacting with the fixed guard and cutter plates, and means to revolve said shaft and colters.

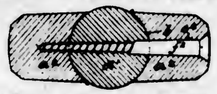
3. In combination with a potato-digging-machine plow, guard and cutting plates on opposite sides thereof, each provided with a sharpened front cutting edge extending upwardly from the plow and with a lateral flange extending under and bolted to the plow, brackets secured to the sides of the plow and extending above the guard and cutting plates, and revolving colters, coacting with the guard and cutting plates and mounted on said brackets.

812,674. MEASURING INSTRUMENT. VIVIAN OSBORNE, London, England, assignor of two-thirds to John Joseph Connolly and Samuel Frederick Connolly, London, England. Filed Oct. 31, 1904. Serial No. 230,906.



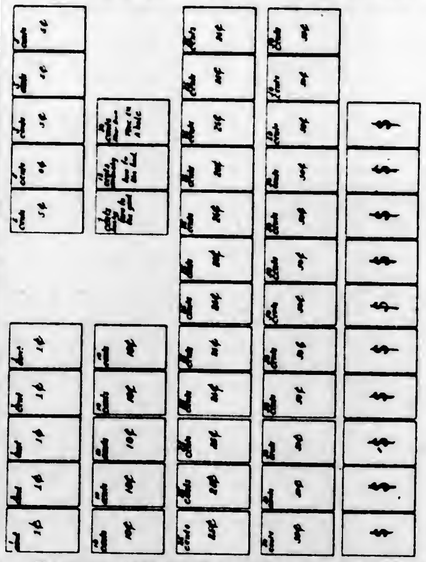
Claim.—In an instrument of the class described, a frame having pointers, a rod fixedly secured to said frame, a tracer connected to the free end of said rod, a worm-threaded axle mounted within the frame and arranged in direct longitudinal alinement with said rod, a graduated wheel fixed to said axle, a graduated disk actuated by said worm-thread for recording the rotation of the wheel, a weight, and a rod pivotally connected to the latter, and to the frame at a point intermediate the graduated wheel and the tracer.

812,675. SPADE AND SIMILAR HANDLE. FRANK PARKES, Birmingham, England. Filed Aug. 26, 1905. Serial No. 275,205.



Claim.—A handle for spades and similar tools and implements comprising an integral structure having a bifurcation forming contractible side sections, a circular shaft on the upper end of which the handle is applied, said side sections provided with recesses conforming to the shape of the shaft and adapted to surround a greater portion of the shaft when in position to prevent lateral displacement, and screw fastenings for securing the side sections to the shaft.

812,676. CARD GAME. IRVING C. PAUL, Cincinnati, Ohio, assignor, by mesne assignments, to The Paul Pattern Company, Cincinnati, Ohio, a Corporation of Ohio. Filed Sept. 26, 1904. Serial No. 226,360.

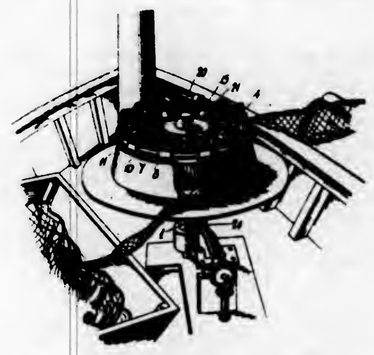


Claim.—An arithmetic card game consisting of regular playing-cards divided into groups of increasing value, the cards of each group having a common numerical value and the numerals of the higher values being divisible by each of the lower values, and two irregular cards whose values differ from the regular cards and whose total value is divisible by the cards of lower value, those irregular cards serving respectively as reward and penalty cards, the total of all the cards being an even number, so that the entire deck shall be required to build up a predetermined number of tricks, substantially as and for the purpose set forth.

812,677. FISH-NET-LIFTING MACHINE. KNUT PAULSON, Manistique, Mich. Filed July 3, 1905. Serial No. 268,096.

Claim.—1. A fish-net-lifting machine comprising a rotary head, guide-brackets thereon, levers, movable jaws carried by said levers, stationary jaws upon said head, slides mounted in said guide-brackets and adapted to actuate said levers, and a cam for operating said slides.

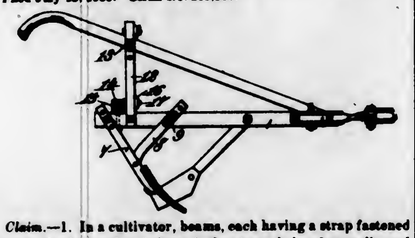
2. A fish-net-lifting machine comprising a rotary head, guide-brackets thereon, levers mounted in said brackets, movable clamping-jaws upon said levers, stationary clamping-jaws upon said head, slides mounted in said guide-brackets, links connecting said slides and said levers, springs for actuating said movable jaws in one direction, and a cam coacting with said slides to move said movable jaws in the opposite direction.



3. A fish-net-lifting machine, comprising a stationary shaft, a head rotatably mounted upon said shaft, radially-disposed guide-brackets upon said head, levers pivotally mounted in said guide-brackets, movable jaws upon said levers, stationary jaws upon said head, operating-slides in said guide-brackets, connections between said slides and said levers, and a cam upon said shaft to actuate said slides, substantially as described.

4. A fish-net-lifting machine comprising a stationary shaft, a sleeve mounted to rotate thereon, means for rotating said sleeve, a circular head secured upon said sleeve, radially-disposed guide-brackets upon said head, levers pivotally mounted in said guide-brackets, stationary clamping-jaws upon said head and formed with guide-openings, movable clamping-jaws pivotally mounted upon said levers and adapted to slide in the guide-openings in said stationary jaws, slides mounted in said guide-brackets, links connecting said slides and said levers, friction-rollers upon said slides, and a cam fixed upon said shaft and adapted to engage said friction-rollers.

812,678. CULTIVATOR. CASWELL PRESSLER, Pleasantgrove, Miss. Filed July 13, 1905. Serial No. 269,517.



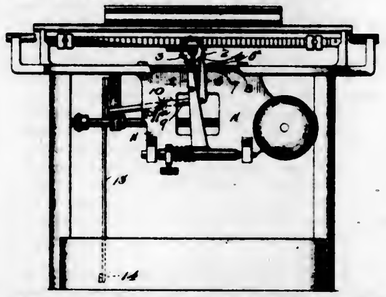
Claim.—1. In a cultivator, beams, each having a strap fastened thereto at the forward end thereof, the straps being forwardly and inwardly curved and one overlapping the other, a pivot-bolt to extend through the overlapped portions of the straps, whereby the beams can be adjusted toward and from each other, and means for maintaining the adjustment of the beams.

2. In a cultivator, the combination of two beams converging toward straps fastened to the forward ends of the beams and overlapping each other at a point beyond the forward ends of the beam, a pivot-bolt extending through the overlapped portions of the straps to provide for adjustment of the beams toward and from each other, uprights rigidly fastened to and rising from the beams, handles supported for rocking motion by the beams, bolts to connect the uprights with the respective handles, each upright having several superposed perforations to receive the bolts, a brace situated above the handles and having perforations at its opposite ends, bolts supported by the uprights and adapted to extend through the last-mentioned perforations to adjustably connect said brace with the uprights, a second brace having perforations at its opposite ends, and a second pair of bolts to extend through the last-mentioned perforations to adjustably connect the last-mentioned brace with the uprights.

812,679. SURGICAL APPLIANCE. MATHIAS REINANNS, Valkenburg, Netherlands. Filed Feb. 5, 1904. Serial No. 192,944.

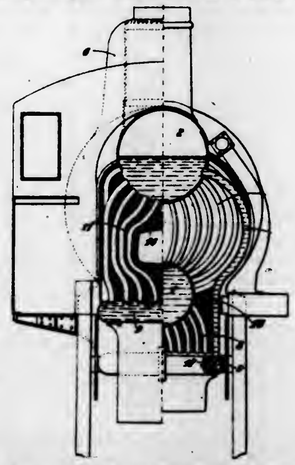
Claim.—As an improved article of manufacture, the herein-described surgical appliance, consisting of a head with rounded entering end, a relatively slender stem extending from the opposite end of said head, an enlargement at the opposite end of said stem of greater diameter than the said head, a flat shield at the base of said enlargement, and a ring attached to said shield and disposed upon the side opposite said enlargement, the whole adapted for use substantially as described.

812,680. BACK-SPACING ATTACHMENT TO TYPE-WRITING MACHINES. GEORGE A. RISE, Williamsport, Pa. Filed June 20, 1904. Serial No. 213,308.



Claim.—In a type-writing machine, the combination of a frame, the shaft of a rack-and-pinion mechanism, an escapement-wheel loose on said shaft, a disk fast on the shaft and arranged to coöperate in the ordinary manner with the escapement-wheel; said disk having ratchet-teeth, a lever fulcrumed at an intermediate point of its length in the frame, a back-space key connected with one arm of said lever, a spring-pressed pawl carried by the other arm of the lever and arranged to turn the disk through the teeth thereof, means for guiding said pawl in its vertical movements, and a spring arranged to move the last-mentioned arm of the lever downwardly subsequent to upward movement of said arm.

812,681. WATER-TUBE LOCOMOTIVE-BOILER. JACQUES ROBERT, Algiers, Algeria. Filed May 4, 1905. Serial No. 258,857.



Claim.—1. An internally-fired water-tube locomotive-boiler having an upper barrel or cylindrical body, a lower barrel or cylindrical body, vertical connection-tubes vaporizing curved tubes ar-

ranged in transverse rows, which are sufficiently spaced for allowing

the inlet into the chamber and having a face to contact with the seat-

in front of the piston in position to be forced out of the nozzle by an

ranged in transverse rows, which are sufficiently spaced for allowing of hand-sweeping, connecting said barrels or cylindrical bodies, lateral doors for the sweeping, a rectangular hollow foundation-ring forming the base of the fire-box and means for connecting by vaporizing and return water-tubes said hollow foundation-ring to the upper and lower barrels or cylindrical bodies while protecting the return water-tubes from the direct heat of the fire, substantially as described.

2. In a boiler of the character referred to having upper and lower barrels or cylindrical bodies and a hollow foundation-ring at the base of the rear thereof, return water-tubes connecting the lower barrel or cylindrical body and fore part of hollow foundation-ring, and forming the fore side of the fire-box, return water-tubes connecting the upper barrel or cylindrical body and the rear part of the hollow foundation-ring, and forming the rear side of the fire-box, lining of refractory materials protecting said tubes against the injurious action of the fire, vaporizing-tubes forming the sides of the fire-box and connecting the hollow foundation-ring and the upper barrel or cylindrical body, substantially as described.

3. A boiler having upper and lower barrels, a hollow foundation-ring forming the base of the fire-box and circular in cross-section, the ring being provided with manholes, return water-tubes between the lower barrel and fore part of the ring and between the rear of the latter and upper barrel, and other tubular means connecting the barrels.

4. A water-tube locomotive-boiler of the class specified, having upper and lower barrels with an intermediate space, inner connecting-tubes between the barrels, outer curved vaporizing-tube clusters arranged in transverse rows and also connecting the barrels, and perforated steam-pipes extending longitudinally through the space between the barrels and interiorly with relation to the tube clusters, the said perforated pipes permitting steam to be thrown outwardly therefrom for cleaning the tube clusters from the interior of the boiler.

5. A water-tube locomotive-boiler of the class specified, having upper and lower barrels with an intermediate space between them, inner connecting tubes between the barrels, outer vaporizing-tube clusters arranged in transverse rows, and upper and lower perforated steam-pipes extending longitudinally through the intermediate spaces between the said tube clusters and also between the upper and lower barrels, the one perforated pipe being arranged to have the steam therefrom sweep the tube clusters in an oblique direction, and the other perforated pipe disposed to cause the steam therefrom to sweep the tubes along the spaces between their transverse rows.

812,682. **SLACK-ADJUSTER FOR DRAW-BARS.** EDWARD RYAN, Clinton, Iowa. Filed July 17, 1905. Serial No. 270,088.

Claim.—1. A slack-adjuster of the character described, comprising a pair of levers, offset apertured lugs formed on said levers near one end thereof, a link pivotally connected at its opposite ends to said lugs, and means to yieldingly connect the opposite ends of said link to the longer ends of said lever, substantially as described.

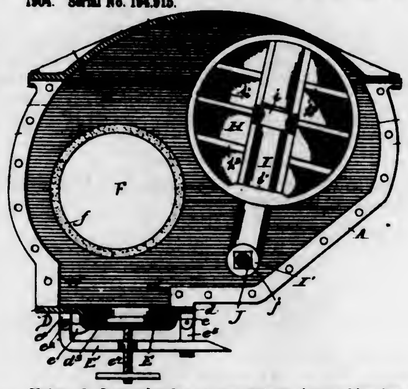
2. A slack-adjuster of the character described, comprising a pair of levers, offset apertured lugs formed on said levers near one end thereof, a link pivotally connected to said lugs, tension-rods arranged on the pivoted ends of said link, and means whereby the longer ends of said levers are yieldingly connected to said rods, substantially as described.

3. A slack-adjuster of the character described, comprising a pair of levers, offset apertured lugs formed on said levers near one end thereof, a link pivotally connected to said lugs, tension-rods arranged on the pivoted ends of said link and adapted to project through apertures in the longer end of said levers, and means whereby said ends of the levers are yieldingly and adjustably connected to said tension-rods, substantially as described.

4. A slack-adjuster of the character described, comprising a pair of levers, offset apertured lugs formed on said levers near one end thereof, a link pivotally connected to said lugs, threaded tension-rods formed on the ends of said link-bar and adapted to project through apertures in the longer ends of said levers, adjusting-nuts arranged on said rod between the link and said lugs on the levers, adjusting-nuts arranged on the outer end of said rods, and a coiled spring arranged between said latter nuts and said ends of the levers, substantially as described.

5. A slack-adjuster of the character described, comprising a pair of levers, offset apertured lugs formed on said levers near one end thereof, a link pivotally connected to said lugs, and adapted to project through apertures in the longer end of said levers, means whereby said ends of the levers are yieldingly and adjustably connected to said tension-rods, a slotted draw-bar, and connecting-rods to pivotally connect the shorter ends of said rods with said slotted draw-bar and with the draw-bar on the opposite end of the tender, substantially as described.

812,683. **VALVE FOR GAS-GENERATORS.** RUDOLPH SCHENCK, Chicago, Ill., assignor to John Williamson, Chicago, Ill. Filed Feb. 23, 1904. Serial No. 194,915.



Claim.—1. In a valve for gas-generators, the combination of a shell or casing having a chamber with an inlet thereinto and having a seating-face for a valve around the inlet, a valve-disk having a face to coact with the seating-face around the inlet, a swinging arm within the chamber of the shell or casing and on which the valve-disk is loosely suspended and carried, and swung on the arc of a circle into its closed and opened positions, and a bearing contacting the fixed end of the arm for furnishing a counter-pressure to the acting face of the valve-disk in seating the disk, substantially as described.

2. In a valve for gas-generators, the combination of a shell or casing having a chamber with an inlet thereinto and having a seating-face for a valve around the inlet, a valve-disk having a face to coact with the seating-face around the inlet, a swinging arm within the chamber of the shell or casing and on which the valve-disk is loosely suspended and carried, and swung on the arc of a circle to its closed and opened positions, a rocking support on which the swinging arm is socketed, and a stuffing-box having a bearing end entering into the shell of the casing and engaging with the socket of the arm for giving a counter-pressure on the valve-disk in seating the disk, substantially as described.

3. In a valve for gas-generators, the combination of a shell or casing having a chamber with an inlet and an outlet and having a valve-seat around the inlet into the chamber, a valve-disk controlling

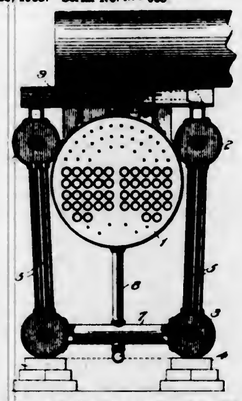
the inlet into the chamber and having a face to contact with the seating-face around the inlet, and having on its rear face in the center a socket and having near its periphery a loop and an arm entered through the loop and into the socket on which the valve-disk is loosely mounted and supported, permitting the valve-disk to be seated when swung on the arc of a circle to its closed position, substantially as described.

812,684. **GREEN ANTHRAQUINONE DYE.** ROBERT E. SCHMIDT, Elberfeld, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed Sept. 8, 1905. Serial No. 277,586.

Claim.—1. The herein-described new dyestuff sulfonic acids obtainable by sulfonating 1-4-diaryldiamido-8-oxyanthraquinone sulfonic acids containing the one sulfonic group probably in the anthraquinone nucleus and the other in the aryl nucleus, which dyestuffs are, in the shape of their alkaline salts, green powders easily soluble in water with a green color and on heating in a solution of stannous chlorid in hydrochloric acid they are decomposed under the formation of the 1-4-8-trioxyanthraquinone sulfonic acid and dyeing wool green shades, substantially as described.

2. The herein-described new dyestuff sulfonic acid, obtainable by sulfonating 1-4-diparatolyldiamido-8-oxyanthraquinone sulfonic acid containing the one sulfonic group probably in the anthraquinone nucleus and the other in the benzol nucleus of the tolyl radical, which dyestuff is in the shape of its sodium salt a green powder soluble in water with a green color; being dissolved by concentrated sulfuric acid of 66° Baumé with a bluish-green color and on heating in a solution of stannous chlorid in hydrochloric acid it is decomposed under the formation of the 1-4-8-trioxyanthraquinone sulfonic acid; and dyeing wool yellowish-green shades, substantially as described.

812,685. **STEAM-BOILER.** JOHN C. SCHNEIDER, Winona, Minn. Filed July 28, 1905. Serial No. 271,665.

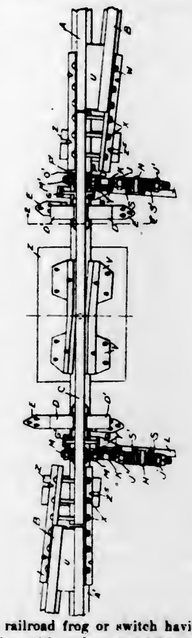


Claim.—In a steam-boiler, the combination of the boiler proper, of side walls therefor each consisting of a lower mud-drum, an upper steam-drum in substantially vertical alinement with the mud-drum, and a plurality of substantially vertically disposed tubes connecting the steam and mud drums throughout the lengths of the latter, a transversely-disposed tube connecting the steam-drums and in communication intermediately with the upper portion of the boiler, and a transversely-disposed tube connecting the mud-drums and in communication intermediately with the lower portion of the boiler.

812,686. **SYRINGE.** HENRY T. SCHORK and FREDERICK A. STAHL, New York, N. Y. Filed July 13, 1905. Serial No. 269,468.

Claim.—In a syringe, the combination with a hollow cylindrical barrel, the upper end of said barrel being open and the lower end reduced to provide a nozzle having a small opening, of a hollow cylindrical piston reciprocally located within said barrel and spaced therefrom, the upper end of said piston being open, a stopper for said open end of the piston, the lower end of said piston reduced to provide a small opening and a circumferential groove, said piston being adapted to contain a liquid medicant which upon outward reciprocation of the piston, the stopper being removed, flows into the barrel in front of the piston in position to be forced out of the nozzle by an inward reciprocation of the piston, a thin flexible resilient packing-ring seated in said groove and spacing the piston from the barrel, said ring having convex upper and lower faces and a sharp circumferential edge, one of said faces adapted to bear against the exterior surface of the piston and the other face against the interior surface of the barrel when the piston is reciprocated inwardly, substantially as described.

812,687. **CONTINUOUS-RAIL FROG AND SWITCH.** FRANKLIN H. SHAKESPEARE, East Orange, N. J. Filed Aug. 5, 1905. Serial No. 272,882.



Claim.—1. A railroad frog or switch having a movable rail, means connected therewith at the point of divergence of the rails for moving the rail so as to form a continuous line of rails at such point, said means connected to the switch-operated mechanism at one end, a sleeve attached to the other end, and a bolt passing through said sleeve and rail, in combination with means to lock said rail in alined position.

2. A railroad frog or switch having a movable rail, means connected therewith for moving said rail so as to form a continuous line of rails for the wheels of the car at the point of divergence of the rails, a sleeve on said means, a bolt passing loosely through said sleeve and movable rail, and springs on said bolt separated by said sleeve.

3. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, said means consisting of a rod, a sleeve on said rod, a bolt having parts of different diameter passing through said sleeve and through the movable rail, nuts on said bolt, and a wedge-shaped piece secured to the mov-

able rail against which one of said nuts abuts when in alined position.

section adapted to move about a central point between the terminals of the intersecting rails, and pivoted locking-braces connected with

rel, both of said end covers communicating with both inlet and outlet passages.

edge of which is formed with upwardly and obliquely extending screw-holes adapted to receive screws for securing the same to the

able rail against which one of said nuts abuts when in alined position.

4. A railroad frog or switch having a movable rail, means connected thereto for moving the rail so as to form a continuous rail-bearing for the wheels of the car at the point of divergence of the rails, a sleeve on said means, a bolt passing through said sleeve, means for securing the bolt to the rail, and means between said securing means and the rail against which one of the said nuts abuts when the rail is in alined position.

5. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, said means consisting of a rod, means for moving said rod, a plate secured to the rod, and means on said rail engaged by said plate for moving the rail from one position to another, after the plate has started to move.

6. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, a plate secured to said means, and means on the rail adapted to engage said means for moving the rail from one position to another.

7. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, said means consisting of a rod, a plate secured thereto, holes in said plate and means on the rail for engaging the holes in the plate for moving the rail after the said plate is moved.

8. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, said means consisting of a rod, a plate thereon, and means engaged thereby for moving said rail, in combination with a locking device on the movable rail for holding said rail in alined position.

9. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, said means comprising a rod, a plate thereon, and means on the rail engaged thereby for moving said rail, in combination with a locking device comprising a bracing-block secured to the ties of the track, and means connected to the movable rail for engaging the same.

10. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, in combination with a locking device for holding the rail when in alined position, said locking device comprising blocks secured to the ties of the track and pivoted braces for engaging said blocks when in alined position.

11. A railroad frog or switch comprising stationary rails of the main track and side track, a movable rail of the track at the point of divergence of the rails, means connected with said movable rail for moving the same so as to form a continuous line of rails at said point, a plate secured to said movable rail operated by said means, and a locking device on the movable rail for holding said rail when in alined position.

12. A railroad frog or switch comprising stationary rails of the main track and side track, a movable rail of the track at the point of divergence of the rails, means for moving said rail so as to form a continuous line of rails at said point, and a plate secured to said moving means, in combination with levers secured to the rail, engaged by said plate, a bar connected with said levers and locking means operated by said bar for holding the rail in alined position.

13. A railroad frog or switch comprising stationary rails of the main track and side track, a movable rail of the track at the point of divergence of the rails, means for moving said rail so as to form a continuous line of rails at such point, and a plate secured to said means in combination with a locking device, said device comprising a bar mounted in bearings secured to said movable rail, levers on said bar adapted to be engaged by said plate, brace-bars on said bar, and blocks secured to the ties of the track against which said brace-bars abut.

14. A railroad frog or switch having a movable rail at the point of divergence of the rails, means connected thereto for moving the rail so as to form a continuous line of rails at such point, in combination with means to guide and limit the movement of the rail, said means comprising ordinary fish plates extending beyond the ends of the stationary rails, and a plurality of curved bolts connecting said extending fish-plates and passing through holes in said movable rail.

15. A railroad-switch having movable rails near the point of divergence of the tracks to form a continuous line of rails at such point, in combination with a movable-rail frog consisting of a rail-section adapted to move about a central point between the terminals of the intersecting rails, and pivoted locking-braces connected with the movable rail of said frog and the movable rail of said switch for locking said rails in alined position, and means for operating said frog-rail and switch-rails simultaneously.

16. A railroad-switch having means connected to the approaching rails near the point of divergence of the tracks for moving the rails so as to form a continuous line of rail at such point, in combination with a movable-rail frog consisting of a rail-section adapted to move about a central point between the terminals of the intersecting rails so as to form a continuous line of rail at such point, said rail-section having pivoted locking-braces connected therewith for locking the same in alined position and means for operating said movable frog-rail on movement of the switch-rails.

17. A railroad-switch having means connected to the approaching rails of the main track near the point of divergence of the side track for moving the rails so as to form a continuous line of rails at such point, and means consisting of a rod passing beneath the rails, sleeves on said rod, and bolts passing through said sleeves and secured to the movable rails, in combination with a movable-rail frog and means for operating said frog simultaneously with said switch.

18. A railroad-frog comprising stationary rails and a movable rail and means for moving the latter, in combination with means for limiting the movement of said rail, comprising ordinary fish-plates extending beyond the ends of said stationary rails, a wedge-shaped filler-block between the rails, and bolts connecting said rails, which pass through said filler-block.

19. A railroad-frog having a movable rail at the point of intersection of the main trauk and side track so as to form a continuous line of rails at such point, said movable rail having a central pivot-point about which it turns, said pivot having parts of different diameter, the large part mounted in said movable rail.

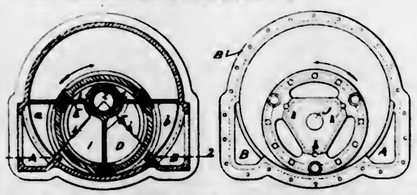
20. A railroad-frog having a movable rail at the point of intersection of the main track and side track so as to form a continuous line of rails at such point, said movable rail having a central pivot-point about which it turns, said pivot-point mounted in the base of said movable rail and having holes on each side of the web of the rail whereby said pivot may be oiled.

21. A railroad-frog having a movable rail at the point of intersection of the main track and side tracks so as to form a continuous line of rails at such point, a pivot removably mounted in the under side of said movable rail, and a plate beneath the frog having a hole therein in which said pivot bears.

22. A railroad-frog having a movable rail at the point of intersection of the main track and side track so as to form a continuous line of rails at such point, said movable rail having a pivot removably mounted in the under side thereof about which it turns, a plate beneath the frog and ordinary fish-plates for holding the pivoted rail against lateral displacement.

23. A railroad-frog having a movable rail at the point of intersection of the main track and side track so as to form a continuous line of rails at such point, said rail having means to prevent longitudinal motion and locking means to prevent lateral motion, said latter means comprising a pivoted brace-bar on each side of the rail, and a block against which said brace-bar abuts.

812,688. **ROTARY EXHAUSTER.** John Sharp, Glasgow, Scotland. Filed Mar. 10, 1905. Serial No. 249,425.

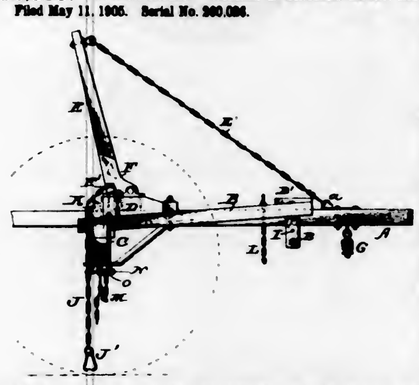


Claim.—1. A rotary exhauster, or the like, comprising an outer casing, a revolving barrel therein, blades in said barrel, and inlet and outlet passages to said casing, in combination with covers at opposite ends of said casing, both said end covers having passages therein opening to the interior of the barrel, and both inlet and outlet passages communicating with both end cover passages.

2. A rotary exhauster, or the like, comprising an outer casing, a revolving barrel with blades therein, and inlet and outlet passages to said casing, in combination with end covers for said casing, passages therein with ports, corresponding ports in the driving end of the barrel, both of said end covers communicating with both inlet and outlet passages.

3. A rotary exhauster, or the like, comprising an outer casing, a revolving barrel with blades therein and having longitudinally-slotted rollers in its circumference, said blades passing through said rollers and having recessed portions on the eyes thereof, in combination with inlet and outlet passages to said casing and revolving barrel.

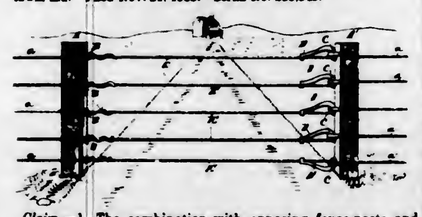
812,689. **LOG-CARRIER.** William H. Sinclair, Mobile, Ala. Filed May 11, 1905. Serial No. 260,026.



Claim.—1. In a log-carrier, the combination, with an axle and hounds provided with guides, of a slidable tongue, log-lifting chains, a pivoted lever, and a chain connecting it with the aforesaid tongue, and bearings for the tongue consisting of two antifriction-rollers arranged respectively below and above the tongue in a front attachment of the hounds, and a rear antifriction-roller arranged adjacent to the axle and beneath the tongue, substantially as described.

2. In a log-carrier, the combination of the axle, the hounds, a block connecting the front ends of the hounds, and parallel bars pendent therefrom and provided with two antifriction-rollers arranged transversely and spaced apart, one above the other, and a rear guide for the tongue, substantially as described.

812,690. **GATE FOR WIRE FENCES.** Roy H. Singer, Uniontown, Md. Filed Nov. 21, 1905. Serial No. 288,343.

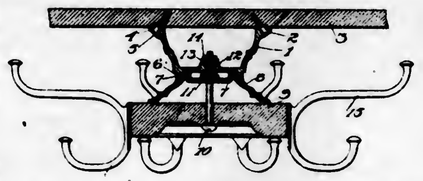


Claim.—1. The combination, with opposing fence-posts and screw-eyes set therein, of wires attached to one set of the screw-eyes and lever-clamps secured to the other ends of the wires and consisting of curved bars having their free ends provided with lateral claws for engaging the wires and their opposite ends with openings for attachment of the wires, and with a contiguous hook or notch, the same being located out of lateral alinement with the opening and claw as shown and described.

2. The improved closure for passage-ways in fences comprising a series of wires, a series of screw-eyes to which the series are permanently attached at one end, lever-clamps secured to the other ends of the wires and having a hook and an end claw which are disalined with the point of attachment of the wire as described, and another series of screw-eyes adapted for engagement with the clamps in the manner described.

812,691. **ROTARY HOOK-SUPPORT FOR GARMENTS AND THE LIKE.** James C. Smith, San Francisco, Cal. Filed May 10, 1905. Serial No. 260,660.

Claim.—1. A rotary hook-support comprising a body the upper edge of which is formed with upwardly and obliquely extending screw-holes adapted to receive screws for securing the same to the under side of a shelf or other support, a hook-carrier, a bolt passed through said hook-carrier axially thereof and also through said body centrally in respect to said flange, nuts on the end of said bolt, and hooks secured to the periphery of said carrier, substantially as described.



2. A rotary hook-carrier comprising a hollow stationary member having a flange provided with means for securing the same to a shelf or other support, a hollow revoluble member, a cylindrical hook-carrier, a bolt passed centrally through said hook-carrier and revoluble and stationary members, a nut firmly clamping the revoluble member to the hook-carrier, a nut on the bolt attaching said revoluble member and hook-carrier to the stationary member, and hooks carried by said hook-carrier, substantially as described.

812,692. **TIME-INDICATOR FOR LETTER-BOXES.** James C. Smith and John S. Davis, Montgomery, Ala. Filed Oct. 13, 1905. Serial No. 282,571.

Claim.—1. The combination with a suitable box having a hinged door constructed with a suitable window, of drums spacedly supported on the inner side of the door, an endless band on the drums having indicating characters thereon, adapted for display through said window, a ratchet-wheel on one of the drums, and a dog secured to the inner side wall of the box, the dog being adapted for engagement with the ratchet-wheel teeth, and for rotation of the adjacent drum upon closure of the box-door, substantially as described.

2. The combination with a letter-box having a hinged door, and the latter provided with a suitable window, of indicating mechanism consisting of a drum supported by brackets fixedly located on the rear side of the box-door, a similar drum supported in brackets adjustably secured to the same side of the box-door, a pawl on the latter brackets, rack-teeth on the door, the same being located for engagement by the pawl, a ratchet-wheel on one of said drums, and a dog on the inner side of the box, the same being arranged for engaging the ratchet-wheel teeth, substantially as described.

3. The combination of a letter-box door having a suitable window, of indicating mechanism employing a fixedly-located drum, an adjustable similar drum, a pawl in connection with the latter drum, and rack-teeth on the door, whereby to secure the second drum as adjusted, an endless band on said drums, the band consisting of a series of connected plates having time characters marked thereon, a ratchet-wheel on one of said drums, and a dog on the letter-box, the same being arranged for engaging the ratchet-wheel teeth upon closure of the box-door, substantially as described.

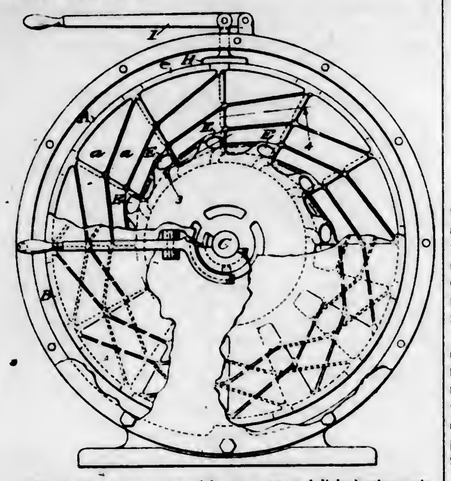
812,693. **STEAM-TURBINE.** Norman R. Smith, Seattle, Wash. Filed June 8, 1905. Serial No. 264,354.

Claim.—1. A steam-turbine comprising two opposed disks having a plurality of series of spirally-disposed cups or buckets formed in their opposed faces, and means for discharging steam into the inner cup of each series.

812,694. **CLUTCH.** Israel H. Spencer, St. Louis, Mo. Filed Feb. 20, 1904. Serial No. 194,912.

chute, a slide having connection with said rock-shaft, a driven shaft having a finger arranged for engagement with said slide, and a retractile spring connected to said rock-shaft for returning it to normal position after it has been oscillated by said slide, substantially as set parts and to the lever for rocking the aforesaid shaft to store up power by means of which said mechanism is actuated, and means also operated by the reciprocating parts for setting said power-storing device into action for actuating said mechanisms.

ing a plurality of series of spirally-disposed cups or buckets formed in their opposed faces, and means for discharging steam into the inner cup of each series.



2. A steam-turbine comprising two opposed disks having a plurality of series of spirally-disposed cups or buckets formed in their opposed faces, means for discharging steam into the inner cup of each series, and means for securing either disk to the shaft and for holding the other disk against turning.

3. A reversible steam-turbine comprising two disks mounted upon a common axis with faces in contact, said contacting faces having cups formed therein and disposed in a plurality of spirally-disposed series and means for injecting steam to the innermost of these cups, said cups being formed to deflect the steam in a direction which is a combination of a tangential and an axial direction and into a cup upon the other disk.

4. A reversible steam-turbine comprising two disks mounted upon a common axis with faces in contact, said contacting faces having cups formed therein and disposed in a plurality of layers the successive cups of any series being at an increased distance from the center and means for injecting steam to the innermost cups of each series, said cups being formed to deflect the steam in a direction which is a combination of a tangential and an axial direction and into a cup upon the other disk, and means for clamping said disks to their shaft and for holding them against turning, operated in alternate and opposite relation.

5. A steam-turbine disk having cups in the face thereof arranged in a plurality of series the cups of each series being spirally disposed.

6. A steam-turbine disk having cups in its face, said cups having a major axis and an inner surface, sloping from the surface of the disk at one end of the major axis inward to a maximum depth at or near the other end of its major axis, said major axis extending substantially in a direction which is tangential from the deeper end of the cup.

7. A steam-turbine disk having cups in its face having their major axes substantially tangential and deepest at the inner ends of said axes and sloping thence to the surface at the outer ends of said axes.

8. A steam-turbine disk having cups in its face arranged in a plurality of spirally-disposed series, said cups being deepest at their ends toward the center in the direction of the spirals.

9. A steam-turbine comprising two disks mounted to turn with their faces in contact, each disk having cups in its contact-face arranged in a plurality of spirally-disposed series, said cups being deepest at their ends toward the center in the direction of its spiral and the spirals of the two disks extending respectively in opposite directions.

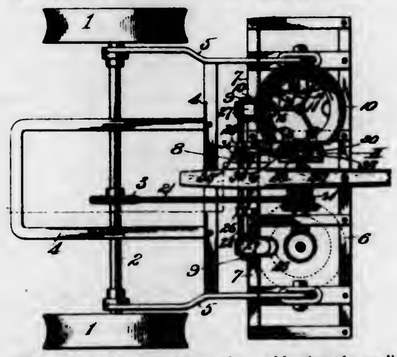
10. A steam-turbine comprising two disks mounted to turn with their faces in contact, each disk having cups in its contact-face arranged in a plurality of spirally-disposed series, said cups being deepest at their ends toward the center in the direction of the spiral, the spirals of the two disks extending respectively in opposite directions, and means for discharging jets of steam into the innermost cups of said series.

812,694. CLUTCH. ISRAEL H. SPENCER, St. Louis, Mo. Filed Feb. 20, 1904. Serial No. 196,912.

Claim.—1. In a clutch, the combination of a shaft, a hub fixed to said shaft and having tapering runways, a drive-wheel hub having a head fitting over said shaft-carried hub, clutch-balls in said runways, and means for retaining said clutch-balls at the deepest ends of said runways; said means consisting of a rocking shift-plate, pins carried by said shift-plate extending into said runways, and a throw-plate having connection with said shift-plate, substantially as set forth.

2. In a clutch, the combination of a shaft, a hub fixed to said shaft and having tapering runways, a drive-wheel hub having a head fitting over said shaft-carried hub, clutch-balls in said runways, and means for retaining said clutch-balls at the deepest ends of said runways; said means consisting of a rocking shift-plate, pins carried by said shift-plate extending into said runways, and a rocking throw-plate having connection with said shift-plate, substantially as set forth.

812,695. POTATO-PLANTER. HENRY J. SPRINGER, Edwardsville, Ill., assignor to Springer Bros. Manufacturing Company, Edwardsville, Ill., a Corporation. Filed Sept. 9, 1905. Serial No. 277,758.



Claim.—1. In a potato-planter, the combination of a seedbox, means in said seedbox for delivering seed therefrom, a chute into which the seed is delivered, a driven shaft for operating said seed-delivering means, a rock-shaft, a valve carried by said rock-shaft and arranged to operate in said chute, and means actuated by said driven shaft connected to said rock-shaft to impart oscillation thereto, substantially as set forth.

2. In a potato-planter, the combination of a seedbox, means for delivering seed therefrom, a chute into which the seed is delivered, a driven shaft provided with a finger and arranged to operate said seed-delivering means, a rock-shaft, a valve carried by said rock-shaft and arranged to operate in said chute, and a slide connected to said rock-shaft and arranged to be engaged by the finger of said driven shaft, substantially as set forth.

3. In a potato-planter, the combination of a chute, a rock-shaft, a valve carried by said rock-shaft and arranged to operate in said chute, a slide having connection with said rock-shaft, and a driven shaft having a finger arranged for engagement with said slide, substantially as set forth.

4. In a potato-planter, the combination of a chute, a rock-shaft, a valve carried by said rock-shaft and arranged to operate in said chute, a slide having connection with said rock-shaft, a driven shaft having a finger arranged for engagement with said slide, and a guide in which said slide operates, substantially as set forth.

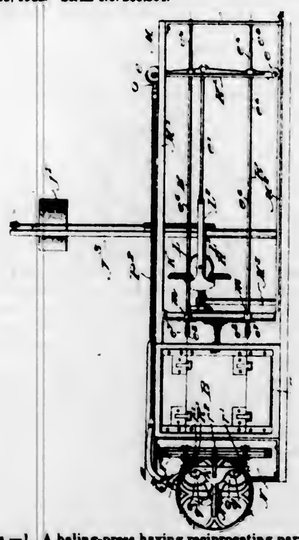
5. In a potato-planter, the combination of a chute, a rock-shaft, a valve carried by said rock-shaft and arranged to operate in said chute, a slide having connection with said rock-shaft, a driven shaft having a finger arranged for engagement with said slide, and a retractile spring connected to said rock-shaft for returning it to normal position after it has been oscillated by said slide, substantially as set forth.

6. In a potato-planter, the combination of a chute, a rock-shaft, a valve carried by said rock-shaft, and arranged to operate in said chute, a slide having connection with said rock-shaft, a driven shaft, and a finger-wheel carried by said driven shaft and arranged for engagement with said slide, substantially as set forth.

7. In a potato-planter, the combination of a seedbox having a main bottom and an apertured rotatable false bottom, swinging wings carried by said false bottom at the location of the apertures therein, and adjustable wings opposing said swinging wings, substantially as set forth.

8. In a potato-planter, the combination of a seedbox having a main bottom and an apertured false bottom, swinging wings carried by said false bottom at the location of the apertures therein, adjustable wings opposing said swinging wings, and means for securing said adjustable wings to said false bottom in fixed positions, substantially as set forth.

812,696. BALING-PRESS. DORO D. STANERO, Lamar, Mo. Filed May 13, 1905. Serial No. 260,204.



Claim.—1. A baling-press having reciprocating parts, mechanism for feeding wire to said press, mechanism for cutting the wire, mechanism for joining the ends of the cut-off portion of the wire, and means operated by said reciprocating parts for storing up power to actuate said mechanisms.

2. A baling-press having a reciprocating plunger and pitman, mechanism for feeding wire to said press, mechanism for cutting off a portion of the wire, mechanism for joining the ends of the cut-off portion of the wire, means operated by one of said reciprocating parts for storing up power to actuate said mechanisms, and a tripping device adapted to be disconnected by the movement of said plunger to render said stored power active.

3. A baling-press having a reciprocating plunger and pitman, combined with a head-block, mechanism for feeding wire to said press mechanism for cutting off a portion of the wire, mechanism for joining the ends of said cut-off portion of the wire, means operated by one of said reciprocating parts for storing up power to actuate said feeding, cutting and joining mechanisms, and a tripping device adapted to be engaged by said head-block for releasing said stored power.

4. A baling-press having reciprocating parts, combined with mechanism for feeding wire to said press mechanism for cutting off a portion of the wire, mechanism for joining the ends of said cut-off portion of wire, a rock-shaft, a lever loose on said shaft, a ratchet device between said lever and shaft, a power-storing device operated to store up power by the shaft, means connected to said reciprocating parts and to the lever for rocking the aforesaid shaft to store up power by means of which said mechanism is actuated, and means also operated by the reciprocating parts for setting said power-storing device into action for actuating said mechanisms.

5. A baling-press having reciprocating parts, mechanism for feeding wire to said press, mechanism for cutting off a portion of the wire, mechanism for joining the ends of said cut-off portions of wire, a rock-shaft, a lever loose on said shaft, a ratchet connection between said lever and shaft, a tripping device adapted to engage said ratchet connection, a power-storing device actuated to store up power by the shaft and release for the utilization of said power by the movement of said reciprocating parts, and a rope or its equivalent connected to said reciprocating parts and to the lever for rocking said shaft to operate said power-storing device to store up power for actuating said mechanisms.

6. A baling-press having reciprocating compressing parts, combined with wire feeding, cutting and joining mechanisms operated by stored power, a rock-shaft, a lever adapted to rock said shaft in one direction, means for storing power attached to said shaft, and a rope or its equivalent connected to said reciprocating parts and to the lever for rocking said shaft to store power by means of which said mechanism is actuated.

7. A baling-press having reciprocating parts including a plunger, sets of wire feeding, cutting and joining devices adapted to be operated by stored power, a rock-shaft, a lever adapted to rock said shaft in one direction, power-storing means attached to said shaft and operatively connected with said wire feeding, cutting and joining devices, a rope or its equivalent connected to said reciprocating parts and to the lever for rocking said shaft to actuate said power-storing means for storing up power, and a tripping device for holding said power-storing device inactive and adapted to be released by the action of the plunger.

8. A baling-press having bale-compressing mechanism, devices for applying and fastening wire about a compressed bale, mechanism for operating said devices, means operated by the bale-compressing mechanism for storing power, and a trip actuated by said bale-compressing mechanism to release said stored power and drive said wire-fastening devices.

9. Combined in a bale-wiring mechanism, a fixed knife and wire-clamp, a movable knife and wire-clamp, a wire-twisting head, and a shield to protect said twisting-head by partly surrounding it.

10. Combined in a bale-wiring mechanism, a wire-twisting head, a wire-holding hook adapted to slide longitudinally into and out of said twisting-head, and a wheel having cams thereon for causing the hook to slide, and also means for rotating the twisting-heads.

11. Combined in a bale-wiring mechanism, wire-twisting heads, wire-holding hooks adapted to slide into and out of said twisting-heads, an intermittently-rotatable wheel having a series of cams on one edge, and teeth on its periphery and carrying a gear-ring, means operated by the cams for sliding the hook, gearing turned by the gear-ring for rotating said twisting-head, and a rocking lever adapted to engage said peripheral teeth and turn the wheel.

12. A baling-press having reciprocating parts, wire feeding, cutting and fastening devices, a head-block moved by said reciprocating parts, means operated by said reciprocating parts for storing power to be used in driving said wire feeding, cutting and fastening devices, and a tripping device actuated by said head-block for rendering said stored power active.

13. Combined in a bale-wiring mechanism, wire cutting and clamping devices, wire-twisting devices, wire-feeding needles, a carriage carrying said needles, mechanism for reciprocating said carriage and needles, and means operated by the travel of said carriage to actuate the devices for cutting, clamping and twisting the wires.

14. Combined in a bale-wiring mechanism, tubular wire-feeding needles, a carriage carrying said needles, a supporting-frame for the carriage and needles, and hollow wire-guides attached to said frame and extending into said needles.

15. Combined in a bale-wiring mechanism having devices for feeding, cutting and clamping wires and twisting the ends thereof, a shaft, a lever thereon and connected thereto by a ratchet device, a bale-compressing mechanism adapted to move the lever and rotate the shaft in one direction, means for storing power attached to said shaft to turn it in opposite direction, a gear-wheel connected by a clutch to said shaft when turned by said stored power, and mechanism for operating said feeding, cutting, clamping and twisting devices, when said gear-wheel is turned.

16. A head-block for a baling-press or the like, composed of separable parts, connected by movable dogs and having baling wire or strand openings extending therethrough, the dogs being opera-

tive to release the parts by the bale-securing wires or strands moving outwardly from the block.

train-line, an egress-passage whereby the train-line may be charged

wound springs interposed, within said chamber, between said tread

versely thereto, and means for mechanically moving said locking

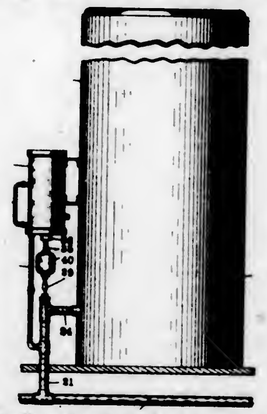
tive to release the parts by the bale-securing wires or strands moving outwardly from the block.

17. A head-block for a baling-press or the like, composed of separable sections having bale-securing wire or strand openings extending therethrough, with outlets at opposite sides of the block, and means for holding the parts of the block in assembled relation.

18. A head-block for a baling-press or the like, composed of separable parts and having openings extending therethrough from end to end for the reception of bale-securing wires or strands, the said openings having outlets at opposite sides and the walls thereof inclining outwardly toward the joints between the parts.

19. A head-block for baling-presses and the like, composed of a series of separable sections having bale-securing wire or strand openings extending therethrough from end to end, and gravitating securing devices for normally holding the sections of the block in connected relation.

812,697. **AIR-BRAKE APPARATUS.** AUGUSTUS A. ST. CLAIR, Indianapolis, Ind. Filed Aug. 13, 1905. Serial No. 273,571.



Claim.—1. The combination, with an air-brake system embodying the usual train-line and individual air-brakes for the cars of the train, of a supplemental reservoir at the rear end of the train, connections between said reservoir and said train-line, and means controlled by the train-line pressure for releasing the air in said reservoir and discharging the same into the train-line, thereby producing the usual effect of increased train-line pressure upon the brakes on the cars connected to said train-line when it is desired to release the brakes.

2. The combination, with a railway-train, of the usual air-brake apparatus, a supplemental reservoir at the rear of the train, a branch between the train-line of said apparatus and said reservoir containing a check-valve, another branch leading from said reservoir to said train-line containing a valve, and a piston-valve operated by the train-line pressure for operating said last-mentioned valve, whereby the air stored in said reservoir may be released for the purpose of releasing the brakes.

3. The combination, in an air-brake system, of the train-line, a supplemental reservoir at the rear end of the train, connections between said reservoir and said train-line, a valve in the egress connection, and a piston-valve operated by the train-line pressure for controlling the same.

4. The combination, in an air-brake system, of the train-line, a supplemental air-reservoir, valves for controlling the ingress and egress of air from said reservoir, and a piston-valve for controlling the egress-valve, the cylinder whereof is provided with a by-pass and with an air-escape orifice both of which are arranged to be controlled by the movement of the piston of said valve.

5. The combination, in an air-brake system, of the train-line, a supplemental reservoir connected to the rear portion of said train-line, air ingress and egress passages connecting said reservoir and said train-line, a valve in said passages, and means controlled by a reversal of conditions in the train-line whereby the valve in the egress-passage is actuated.

6. The combination, in an air-brake system, of the train-line, a supplemental reservoir connected to the rear portion of said train-line, an ingress-passage whereby said reservoir is charged from said train-line, an egress-passage whereby the train-line may be charged from the reservoir when the pressure in the train-line has been reduced, a valve for controlling said last-named passage, a piston-valve for controlling said last-named valve, and a supplemental reservoir connected to the opposite end of the piston-valve from said egress-passage valve.

7. The combination, in an air-brake system, of the train-line, a supplemental reservoir connected to said train-line, a valve in the egress-passage from the reservoir to the train-line, a piston-valve whereby said last-named valve may be controlled, the valve-stem of said piston-valve being provided with stops whereby its movement is limited, and the cylinder of said piston-valve being provided with a by-pass and an escape-orifice controlled by the positioning of said piston-valve.

8. The combination, in an air-brake system, of the train-line, a supplemental reservoir connected to said train-line, a valve in the egress connection between said reservoir and said train-line, and a piston-valve for controlling said last-named valve, the valve-stem of said piston-valve being weighted and the friction of said piston-valve thereby overcome in operation.

9. The combination, in an air-brake system, of the train-line, a supplemental reservoir connected to said train-line, a valve in the egress connection between said reservoir and said train-line, and a piston-valve for controlling said last-named valve the area of which is greater than that of the piston in the triple valve controlling the inlet to the auxiliary reservoir.

812,698. **ELASTIC TIRE FOR VEHICLE-WHEELS.** THEODORE STERNE, Paris, France. Filed June 23, 1905. Serial No. 266,657.

Claim.—1. The combination with a wheel, of a resilient tread member therefor, cylindrical cushioning means interposed between the felly of the wheel and said tread member, and rigid means engaging said cushioning member on opposite sides thereof at points intermediate of the felly of the wheel and said tread member, substantially as described.

2. The combination with a wheel, of a resilient tread member therefor, cylindrical cushioning means interposed between the wheel-felly and said tread member, and means for preventing the lateral expansion of said cushioning member substantially on the horizontal axis thereof, substantially as described.

3. The combination with a wheel provided with a peripheral channel having rigid side walls, of a resilient cover or tread member for said channel, and a series of spirally-wound springs interposed, within said channel, between said tread member and the felly of the wheel and tangentially engaging said side walls, substantially as described.

4. The combination with a wheel provided with an annular peripheral channel having rigid side walls, of a resilient tread member covering said channel, and a series of spirally-wound springs interposed, within said channel, between said tread member and the felly of the wheel and contacting said rigid side walls, substantially as described.

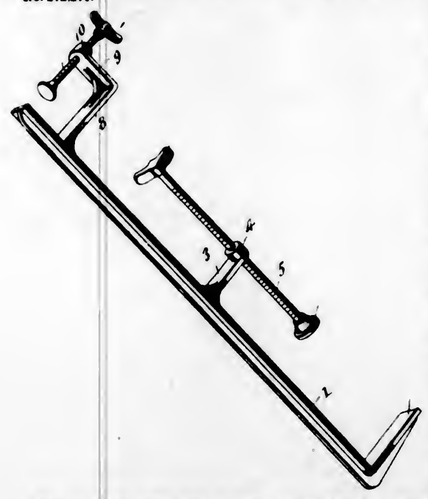
5. The combination with a wheel, of annularly-disposed rigid plates projecting peripherally of the felly of said wheel and forming an annular chamber thereabout, a resilient tread member connecting the ends of said plates, and a series of spirally-wound springs interposed, within said chamber, between said tread member and felly and contacting said rigid plates, substantially as described.

6. The combination with a wheel of peripherally-disposed rigid plates forming an annular chamber thereabout, said plates being provided with interlocking socket-flanges at their ends, a resilient tread member provided with heels adapted to fit within said socket-flanges, and a series of spirally-wound springs interposed between said plates, tread member, and the felly of the wheel and contacting said rigid plates, substantially as described.

7. The combination with a wheel, of peripherally-extending rigid plates forming an annular chamber thereabout, hooked flanged sockets extending around the outer edge of said plates, a flexible tread member provided with wheels adapted to engage said sockets, means for securing same therein, and a series of spirally-wound springs interposed, within said chamber, between said tread member and the felly of the wheel and contacting said rigid plates, substantially as described.

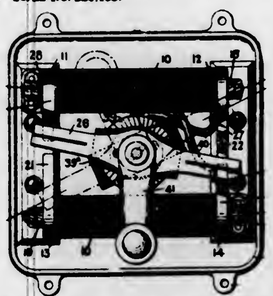
8. The combination with a wheel, of a pair of peripherally-disposed rigid plates provided with socketed ends and forming an annular chamber around said wheel, a resilient tread member having heels thereon adapted to fit within said sockets and provided with an air-chamber, means for inflating said air-chambers for interlocking said tread member with said plates, and spirally-wound springs interposed, within said annular chamber, between said tread member and wheel-felly and contacting said rigid plates, substantially as described.

812,699. **CLAMP.** JOHN J. STEVENS, Dallas, Tex., assignor of one-half to Theodore A. Lampton, Dallas, Tex. Filed Aug. 1, 1905. Serial No. 273,571.



Claim.—A clamp comprising an integral body including a main rail terminally bent to provide a foot, an arm projecting from the rail in spaced parallel relation with the foot and on the same side of the rail as the foot, a clamp-screw having threaded connection with the terminal of the arm and coöperating with the foot, a second arm projecting from the rail at the end opposite the foot, and extending from the rail in a direction opposite to that of the foot, the terminal of the arm being bent into spaced parallel relation with the rail, and a clamp-screw having threaded connection with the terminal of the second arm and coöperating with the rail.

812,700. **RHEOSTAT.** GEORGE E. STEVENS, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Oct. 12, 1904. Serial No. 228,133.



Claim.—1. A rheostat comprising a fixed resistance element, a coöperating movable contact, a spring for returning the parts to off position, a fixed locking member, a yieldingly-mounted coöperating locking member carried by the movable contact and movable transversely thereto, and means for mechanically moving said locking members into engagement.

2. A rheostat comprising a fixed resistance element, a coöperating movable contact, a spring for returning the parts to off position, a fixed locking-magnet, an armature therefor carried by the movable contact and movable transversely to the said contact, and means for moving said armature transversely into operative relation to said magnet.

3. A rheostat comprising a fixed resistance element, a coöperating movable contact, a spring for returning the parts to off position, a fixed locking-magnet, a yieldingly-mounted armature therefor carried by the movable contact and movable transversely to the said contact, and means for moving said armature transversely into operative relation to said magnet.

4. A rheostat comprising a base, a fixed resistance element secured thereto, a coöperating movable element, a spring for returning the parts to off position, an electromagnet mounted on said base, a yieldingly-mounted armature on the movable element of the rheostat normally held away from said magnet, and means for mechanically moving said armature and magnet into operative relation whereby the movable element will be held against the tension of the spring.

5. In a rheostat, the combination with a fixed resistance element and a base therefor, of a pivot-post secured to said base, a magnet located at the foot of said post, a rotary armature supported on said post and movable longitudinally thereof, a yielding laterally-extending contact secured to said armature and adapted to engage the fixed element of the rheostat and to be put under strain by the downward movement of said armature, and means for mechanically forcing said armature downward into operative engagement with said magnet.

6. A rheostat comprising a fixed resistance element, a coöperating movable contact, a fixed locking member, a coöperating movable locking member carried by said movable contact, an operating-handle, and means whereby the movement of said handle will move said contact to its limiting position and a further movement will bring said locking members into engagement.

7. A rheostat comprising a fixed resistance element, a coöperating movable contact, a fixed locking member, a coöperating movable locking member carried by said movable contact, an operating-handle, frictional connecting means between said handle and contact whereby the movement of the former is transmitted to the latter, a stop for limiting the movement of the contact, a cam connection between the locking member and the handle whereby upon a further movement of the latter the locking members will be moved into engagement.

8. In a rheostat, the combination with a fixed resistance element and a base therefor, of a pivot-post secured to said base, a magnet located at the foot of said post, a rotary armature supported on said post and movable longitudinally thereof, an operating-lever mounted on said post above said armature, a yielding laterally-extending contact secured to said armature and adapted to engage the fixed element of the rheostat and to hold the armature and operating-lever in close engagement, a stop for limiting the movement of said contact, and coöperating cam-surfaces on said armature and lever whereby the rotation of said lever is transmitted to said contact to carry it against said stop and its further movement forces the armature downward against the magnet.

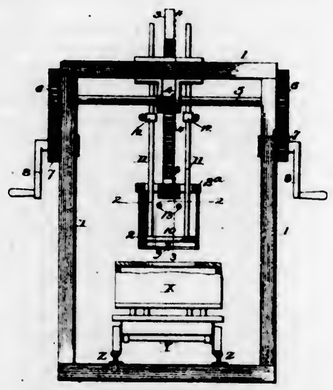
812,701. **TACK-PULLER.** JAMES H. STINER, Gowen, Pa. Filed July 11, 1905. Serial No. 269,230.

Claim.—A tool of the class described comprising a head having an angular socket formed in one end thereof and having its opposite

812,702. **PIANO-ACTION.** WILLIS S. WOOD and ELMER E. [illegible]

end reduced and provided with a V-shaped notch forming a gripping claw, said head being provided with a transverse recess communicating with the socket and having one wall thereof formed with a plurality of openings and the adjacent wall curved laterally to form a fulcrum, an arm projecting laterally from the head at said socket, an operating-handle seated in the socket, and fastening devices passing through the openings and engaging the adjacent end of the operating-handle.

812,702. **CORE-CUTTER FOR CEMENT-BLOCK MACHINES.** JAMES W. STUART, Paris, Ill. Filed Apr. 14, 1905. Serial No. 255,553.



Claim.—1. The combination, with a frame, and a core-cutter for plastic material, and means for raising and lowering it, of a cross-bar arranged transversely within the cutter and near its lower edge, and means for ejecting the core cut out and taken up by the cutter, substantially as described.

2. In a machine of the class indicated, the combination, with the core-cutter a transverse bar connecting the sides of the cutter at a point adjacent to its lower edge, of an ejector consisting of a plate arranged within the cutter and having vertical guides provided with stops, the said ejector resting normally upon the cross-bar within the cutter, and being arrested by the stops when the cutter is moved upward beyond a certain point, substantially as described.

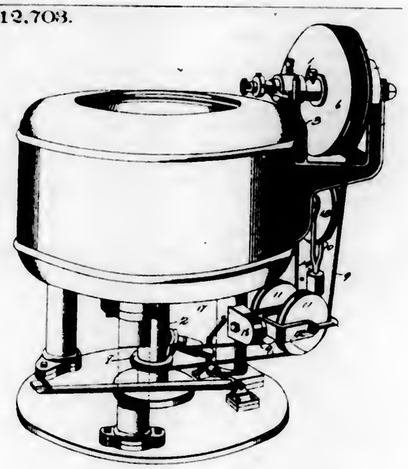
3. In a machine for the purpose specified, the combination, with a frame, a core-cutter, and means for raising and lowering it of an ejector arranged within the cutter, vertical guide-bars attached to said ejector and extending up through the top portion of the frame stops applied to said guide-bars and made adjustable thereon so that they may be set at different distances from the ejector come in contact with the latter when the cutter is raised, and a stop arranged within the cutter for supporting the ejector when the cutter is empty, substantially as described.

4. The combination, with a frame, horizontal guide-rails, a truck adapted to run thereon, and a mold-box supported upon said truck and provided with a top having an opening, of a vertically-movable core-cutter adapted to enter the mold-box, means for raising and lowering the said cutter, an ejector contained within the cutter, and adapted to arrest the core and force the same out when the cutter is raised to a sufficient height, substantially as described.

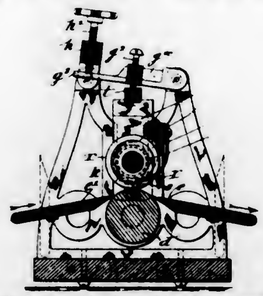
812,703. **BELT-GEARING FOR EXTRACTORS.** JOHN T. TRUITT, St. Louis, Mo. Filed Feb. 12, 1903. Serial No. 143,091.

Claim.—A belt-gearing for extractors comprising a driving-shaft, a peripheral pulley therewith, a counter-shaft, a fast and a loose pulley thereon, said shaft being also provided with a fast and a loose grooved pulley, a support having a two-part frame provided with a single shaft having thereon a pair of pulleys separately mounted in each part of the frame, a yoke pivoted to the ends of the single shaft and arranged in front of the pulleys on the single shaft, a pulley rotatably mounted in a depending weighted hanger, a driving-band mounted respectively on the pulley of the driving-shaft, the pulleys of the two-part frame, the depending pulley, and also on the grooved pulleys on the counter-shaft, substantially as specified.

812,703.



812,704. **MACHINE FOR MAKING FLAT MACARONIS.** ANGELO DE VITO, New York, N. Y. Filed May 4, 1905. Serial No. 258,905.



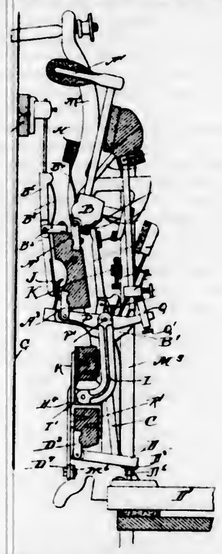
Claim.—1. In a machine for making flat macaronis, the combination, with supporting side frames, of a lower roll, an upper roll, detachable journal-blocks for supporting the upper roll, a guard-plate supported on the journal-blocks alongside of the upper roll, a pivoted locking-frame for the journal-blocks of the upper roll and a pivoted locking-bail for the locking-frame.

2. In a machine for making flat macaronis, the combination, with supporting side frames, of a lower rotating roll, detachable journal-blocks supported in guide-recesses of the side frames, an upper roll supported in bearings of said journal-blocks, fulcrumed guide-boards arranged at each side of the lower roll, a guard-plate supported alongside of the upper roll, a locking-frame pivoted to the upper end of the side frames on one side of the blocks and provided with a central heel and a locking-frame pivoted at the opposite side of the journal-blocks and provided with a central set-screw for engaging the heel of the locking-frame.

3. In a machine for making flat macaronis, the combination, with supporting side frames, of a lower roll supported in journal-bearings of the same, journal-blocks supported between guide-rails of the side frames, a cutting-roll supported in bearings of the journal-blocks, inclined guide-boards fulcrumed at each side of the lower roll, a guard-plate arranged alongside the cutting-roll on the journal-blocks and provided with recesses for the disk-shaped knives of the cutting-roll and means for locking the journal-blocks of the cutting-roll in position.

4. In a machine for making flat macaronis, the combination, with supporting side frames, of a lower rotating roll supported in journal-bearings of the same, journal-blocks supported in guide-rails of the side frames, a cutting-roll supported in bearings of the journal-blocks, inclined guide-boards fulcrumed at each side of the lower roll, a transverse spring-bar extending between the upper faces of the journal-blocks, a locking-frame applied to said spring-bar, and a locking-bail applied to the locking-frame.

812,705. **PIANO-ACTION.** WILLIAM C. VOGEL and HARRY K. SHELL, Newcastle, Ind. Filed July 11, 1904. Serial No. 216,026.



Claim.—1. In a piano-action, a vertical main action-bracket having upper and lower lugs extending laterally from its rear edge, a block carried by said upper lugs, a guide-bracket connected at its upper end to the block and at its lower end to the lower lugs, and a lever-rail adapted to move vertically between the bracket and the guide, as and for the purpose set forth.

2. A piano-action comprising a main action-bracket, a block carried by the rear edge of the bracket, lugs extending from the bracket below the block, a guide-bracket having an upper offset portion secured to the block, lugs formed on the lower end of the guide-bracket adapted to aline with and be secured to the lugs of the action-bracket, and a lever-rail adapted to move vertically between the action and the guide brackets.

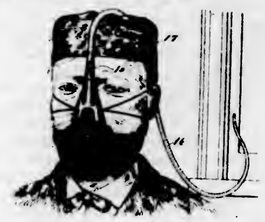
3. The combination with a lever-rail movable vertically, of a movable hammer-rest rail, a soft-pedal rod adapted to lift the hammer-rest rail upwardly and rearwardly, a depending rod pivotally connected to the hammer-rest rail, a block adjustably secured upon said rod, a main action-rail, a lost-motion lever pivotally hung from said main rail at its rear end, a block pivotally supported from the adjustable block and cut out to receive the forward end of the lost-motion lever, an elbow adjustably pivoted to the lost-motion lever intermediate its ends, a hanger secured to the lever-rail and pivotally connected to the lower end of the elbow, a lever pivotally supported at its rear end from the lever-rail, and a key in constant engagement with the forward end portion of the lever.

4. A piano-action comprising a main action-rail, a hammer, a hammer-rest rail, a vertical main action-bracket, a vertically-movable lever-rail, a lost-motion lever pivotally connected to the main action-rail, a block secured to the hammer-rest rail, a depending rod pivoted at its upper end to the said block, a block adjustably secured on said rod, a block pivotally connected to the adjustable block and cut out to receive the forward end of the lost-motion lever, the said lever being provided with a plurality of perforations, an elbow adjustably pivoted at its upper end to the lost-motion lever, and a hanger pivotally connected to the elbow and also connected to the lever-rail.

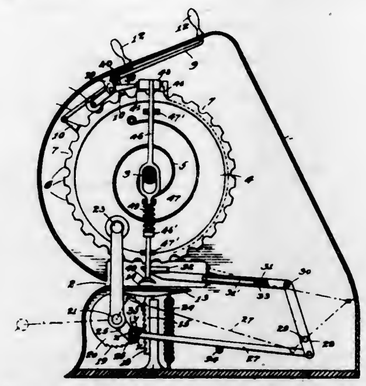
5. A piano-action comprising a vertical main action-bracket, a guide-bracket, a lever-rail movable vertically between the main action-bracket and the guide-bracket and cut away along its lower edges, a block fitted to the said lever-rail to form a rectangular edge, a buckskin covering inclosing the said lever-rail between the main action-bracket and the guide-bracket, and a strip of buckskin interposed between the said covering and the remaining cut-out edge of the lever-rail.

812,706. **RESPIRATOR.** JOSEPH WARBASSE, Newton, N. J. Filed Aug. 3, 1904. Serial No. 219,317.

Claim.—A respirator comprising a nose-mask, the inner edge of the lower wall being curved and provided with a downwardly-extended flange, the said mask having inlet and outlet openings, valves for said openings, a hood over the outlet-opening and open at the bottom the said hood being inclined downward and outward and fully inclosing the valve, a short tube communicating with the inlet, and a flexible tube extending from said short tube.



812,707. **CHECK PRINTER AND PROTECTOR.** ALFRED J. WARE and WILLIAM ZOLLER, Seattle, Wash. Filed Mar. 7, 1905. Serial No. 248,879.



Claim.—1. In apparatus of the class described, the combination with the containing-case and a plurality of wheels provided with peripherally-disposed type characters, of means to move the wheels into predetermined printing positions, means to automatically lock the wheels in such set positions, devices for supporting the article to be printed, type-inking devices, means to successively actuate said inking devices and impinge the article against the type, and spring-actuated means for automatically releasing the locking devices from the wheels during the downward movement of said supporting devices.

2. In apparatus of the class described, the combination with the containing-case, a plurality of adjustable type-wheels, and bars connected with said wheels and extending exteriorly through the case for individually setting said wheels, of inking devices for the wheels, a vertically-movable platen for holding the article to be marked, means for successively actuating the inking devices and elevating the platen to impinge articles against the type-wheels, means for locking the type-wheels in set position during the printing operation, and means for automatically releasing the wheels when the printing operation is completed.

3. In apparatus of the class described, the combination with the case, a shaft fixedly connected thereto, a plurality of type-wheels rotatively mounted on said shaft and spring connections between said wheels and shaft acting to rotate the wheels back to their initial positions, of means to adjustably move the wheels into printing positions, means to lock wheels in their adjusted positions, a platen, an inking mechanism and a common means acting to successively actuate the inking mechanism, elevate the platen to bring the article to be printed against the type and to release the locking mechanism of the type-wheels.

4. In apparatus of the class described, the combination with the containing-case the type-wheels, the means for individually setting the wheels against the action of springs, said springs, brake devices for locking the wheels in their adjusted positions, the platen, means

to raise the platen against the actions of springs, last-named springs,

on the carrier so that it will grip or release an end of metal inserted

formed therein, a valve arranged in said valve-body, a rod extending

to raise the platen against the actions of springs, last-named springs, spring-pressed means for retaining the article to be marked upon the platen, said last-named means carrying devices for disengaging the brake devices from the type-wheels to allow the latter to return to their initial positions.

5. In an apparatus of the class described, in combination, marking mechanism including type-wheels and inking devices for said type-wheels, a movable platen for supporting the article to be marked, spring-pressed devices for holding the article upon the platen, locking devices for the type-wheels, and means for successively operating the inking mechanism, and elevating the platen, and means automatically operating to release the type-wheels when the printing operation is completed, substantially as described.

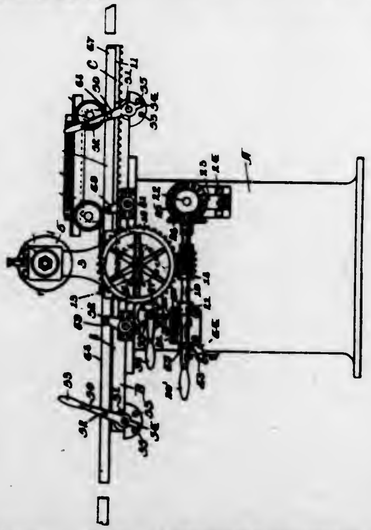
6. In apparatus of the class described, the combination of the marking mechanism, the platen, the brake devices for locking the wheels of said marking mechanism in their adjusted positions, and means for elevating the platen into marking position and devices coacting with the platen and adapted to disengage said brake devices.

7. In a check-printer, a plurality of type-wheels mounted to be rotated, and means for individually moving said wheels, inking devices for said wheels a platen on which the article to be printed is supported, means for successively actuating the inking devices and the platen, means for locking said type-wheels in the set position comprising spring-pressed brake-wheels normally held in engagement with the type-wheels, substantially as described.

8. In a check-printer, a plurality of type-wheels mounted to be rotated, and means for individually moving said wheels, inking devices for said wheels, a platen on which the article to be printed is supported, means for successively actuating the inking devices and the platen, means for locking said type-wheels in the set position comprising spring-pressed brake-wheels normally held in engagement with the type-wheels, and means operating automatically with the return movement of the platen to release said brake-wheels, substantially as described.

9. In a check-protector, a plurality of type-wheels, means for individually setting the wheels in marking position, a vertically-movable platen, means for actuating said platen to elevate the article being marked into engagement with the type-wheels, spring-pressed brake-wheels engaging the type-wheels to hold the same in the set position, means operating automatically with the return of the platen to its normal position to release said brake-wheels and means for returning the type-wheels to their normal position when the brake-wheels are released, substantially as described.

812,708. MACHINE FOR MANUFACTURING PRINTERS' LEADS. CYRUS C. WEBSTER, Minneapolis, Minn. Filed Oct. 22, 1904. Serial No. 229,583.



Claim.—1. A machine of the class set forth, consisting of a suitable bed, a carriage, a series of parallel clamps, equally spaced apart, for holding strips of material across said carriage, a gang of cutters, means for effecting relative sliding motion between said cutters and carriage, for the purpose of causing said cutters to enter between said clamps and cut said strips into pieces, and a tenon-and-mortise connection between each clamp and the carriage, to enable lifting the clamps off of the carriage.

2. A machine for cutting printers' leads, consisting of a series of parallel clamps, spaced apart, for holding strips of material, a carriage below said clamps, a gang of cutters, a suitable bed, means for permitting said carriage to move upon said bed and cause said cutters to enter between said clamps and cut said strips into pieces, and means for attaching said clamps to, and permitting them to be detached from, said carriage, for the purposes specified.

3. A machine for cutting printers' leads, consisting of a carriage, a suitable bed below said carriage, a series of clamps, for holding strips of material, mortised in said carriage and adapted to be removed vertically therefrom, a plurality of cutters by which the strips held by said clamps are cut into equal lengths, and means for permitting said cutters and carriage to pass one another.

4. A machine for cutting printers' leads, consisting of a plurality of parallel clamps, equally spaced apart, a suitable carriage for supporting said clamps, a tenon on each clamp, a mortise in said carriage for receiving each tenon, a supporting-bed, a sliding connection between said bed and carriage, and a gang of cutters adapted to enter between said clamps, for the purposes specified.

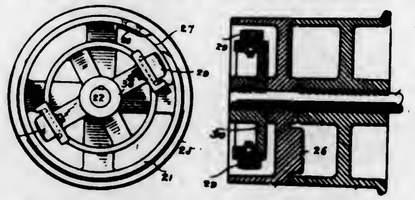
5. A machine of the class set forth, consisting of a bed having a pair of parallel guides, a sectional track, means for raising and lowering sections of said track, a gang of cutters, a carriage slidably mounted upon said guides, feed mechanism for said carriage, a truck adapted to run upon said track, means for locking said truck on said carriage when the sections of said track are lowered, and actuating mechanism for driving said parts.

6. A machine for cutting printers' leads, consisting of a bed, a carriage in sliding connection with said bed, a gang of cutters, a truck adapted to move above said bed, and means for locking said truck on said carriage.

7. A machine of the class set forth, consisting of a bed having parallel guides, a track, cutting mechanism, a carriage in sliding connection with said guides, means for moving said carriage on said guides, a truck adapted to run upon said track, means for moving said track to permit said truck to rest upon said carriage, means for locking said truck on said carriage, and actuating mechanism.

8. A machine of the class set forth, consisting of a bed, having parallel guides, a track, means for raising and lowering said track, a carriage on said guides to receive a truck off of said track, a detachable stop on said carriage against which said truck is adapted to impinge, a lock on said carriage for holding said truck against said stop, feed mechanism for moving said carriage on said guides, and actuating mechanism.

812,709. DRUM FOR COILING METAL. WILLIAM R. WEBSTER, Bridgeport, Conn. Filed Apr. 27, 1905. Serial No. 257,060.



Claim.—1. A coiling-drum comprising a loose drum having a peripheral opening and a locking-surface and a rotating carrier within the drum, said parts being so constructed that the insertion of the end of a piece of metal between them will connect them together and the drum will be rotated by the carrier and the metal coiled thereon.

2. A coiling-drum consisting of a loose drum having a peripheral opening and forward of said opening a locking-surface, and a rotating carrier having a coacting locking-block adapted to grip an end of metal between itself and the locking-surface on the drum so that said end of metal will serve as a connection between the carrier and the drum and the drum will be carried forward by the carrier and the metal coiled thereon.

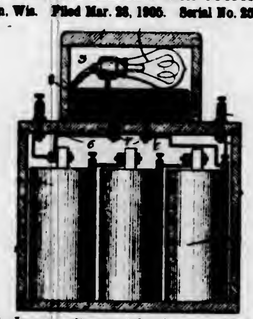
3. A coiling-drum comprising a loose drum having a peripheral opening and a locking-surface, a rotatable carrier having a pivoted coacting locking-block and means for oscillating the locking-block on the carrier so that it will grip or release an end of metal inserted in the opening.

4. A coiling-drum comprising a loose drum having a peripheral opening and a locking-surface, a rotatable carrier having a pivoted coacting locking-block, an arm extending therefrom, an oscillatory sleeve having an arm extending therefrom, and a link connecting the arm extending from the sleeve with the arm extending from the locking-block on the carrier, substantially as described, for the purpose specified.

5. In a device of the character described the combination with a hollow shaft having a longitudinal slot, a carrier rigidly secured thereto and a sleeve loose thereon and having extending arms and a spiral slot, of a drum loosely mounted on the sleeve and having a peripheral opening and a locking-surface, locking-blocks pivoted on the carrier and having arms extending therefrom, links connecting said arms with the arms extending from the sleeve, and a rod within the shaft having a pin engaging the slot therein and the spiral slot in the sleeve so that longitudinal movement of the rod will oscillate the sleeve and the locking-blocks upon the carrier and cause them to grip or release an end of metal passed through the opening in the drum.

6. The combination with a shaft, a drum fixed thereto and a drum loose thereon and having a peripheral opening and a locking-surface, of a rotating carrier fixed to the shaft and lying within the loose drum and a locking-block on the carrier adapted to grip an end of metal between itself and the locking-surface on the loose drum, said end of metal serving as a connection between the loose drum and the carrier, shaft and fixed drum, so that all of the parts will rotate together.

812,710. PORTABLE ELECTRIC-LAMP OUTFIT. ARTHUR WILSON, Berlin, Wis. Filed Mar. 28, 1905. Serial No. 253,582.



Claim.—1. In an appliance of the character described, the combination with a portable receptacle, of batteries therein, a second receptacle, of less width than said first receptacle, superposed upon the first receptacle, an electric lamp, flexible electric connections between said batteries and lamp extending through the upper receptacle and adapted to be stowed, together with said lamp, in said upper receptacle, and means of electric connection with said batteries arranged without said upper receptacle.

2. In an appliance of the character described, the combination with a portable receptacle, of batteries therein, said receptacle provided with openings in its top at each side to receive binding-posts having electric connections with said batteries, a second receptacle, of less width than the first receptacle, superposed upon said first receptacle intermediate of said openings, an electric lamp, and flexible electric connections between said batteries and lamp extending through the upper receptacle and adapted to be stowed, together with said lamp, in said upper receptacle.

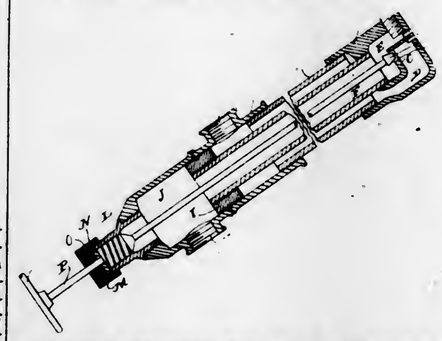
812,711. DEVICE FOR OIL-WELLS. HENRY WILSON, Emlenton, Pa. Filed Feb. 21, 1905. Serial No. 246,776.

Claim.—1. In a device for oil-wells, the combination with a working barrel and a standing valve, of a working valve, a rod passing through the standing valve and connected to the working valve and agitating means carried by said rod, said working barrel being perforated above said agitating means.

2. In a device for oil-wells, the combination with a working barrel constructed in three sections, the intermediate section being perforated, of a plurality of working valves, a standing valve located below the lower of said working valves, a standing-valve body located between said working valves, said valve-body having a seat formed therein, a valve arranged in said valve-body, a rod extending through said valve-body and through the valve arranged therein and connected to said working valves and agitating means carried by said rod between the lowermost working valve and the said valve-body, and adjacent to the perforated section of the working barrel.

3. In a device for oil-wells, the combination with working barrels and working valves arranged in said barrels, of a section of perforated pipe interposed between said barrels, a valve-body mounted between said working valves, a rod extending through said valve-body and connecting with said working valves, a valve carried by said rod and adapted to seat in said valve-body, and agitating means carried by said rod, substantially as described.

812,712. HYDROCARBON-BURNER. FRED J. WOODHEAD, Bakersfield, Cal. Filed Oct. 23, 1903. Serial No. 178,274.



Claim.—1. A hydrocarbon-burner comprising a steam-chamber; a burner-tip on the outer end thereof, said burner-tip having two chambers therein separated by a partition; ports in the chambers of said burner-tip one directly above and the other directly below the front end of the partition; an oil-chamber within said steam-chamber and communicating with the upper chamber of the burner-tip; a port in the partition between the chambers of the burner-tip disposed therein opposite the center of the oil-supply chamber; a valve-stopper adapted to control the port in said partition, said valve-stopper having a stem extending rearwardly through the oil-chamber and having means to give said stem a longitudinal movement in said chamber.

2. A hydrocarbon-burner comprising an oil and a steam chamber each having an independent outlet-port, said chambers being in communication with each other near the outlet-ports; means to control said communication, means to create a back pressure by steam in the oil-chamber near the outlet thereof.

3. An atomizing oil-burner, having walls forming passages respectively for the oil and atomizing fluid, said passages having separate outlets, and one of the walls having an orifice therein leading from the fluid-passage to the oil-passage to communicate the pressure of the fluid to the oil-passage, whereby automatically to regulate the oil-discharge.

4. An atomizing oil-burner, having walls forming passages re-

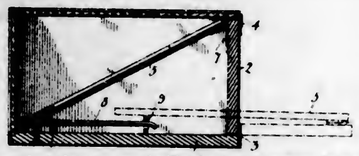
provided with a fixed jaw located at one side of the central aperture;

coils, a transmitter and a common vibratory diaphragm, a trans-

spectively for the oil and atomizing fluid, said passages having separate outlets, and one of the walls having an orifice therein leading from the fluid-passage to the oil-passage to communicate the pressure of the fluid to the oil-passage, whereby automatically to regulate the oil-discharge, and means for regulating the area of the oil discharge or outlet

---

812,713. SHOW-CASE. ANDREW W. ZEIGLER, Ellwood City, Pa. Filed Oct. 16, 1905. Serial No. 283,966.



Claim.—1. A show-case or the like, having a downwardly-opening swinging door, a false bottom or goods-support mounted to slide on the bottom of the case and loosely connected to the door at an elevated point to cause said false bottom to be moved into the case and disposed in an inclined position by the closing of the door, and to be moved outwardly from the case and disposed in a horizontal position by the opening of the door.

2. The combination with a show-case or the like having a swinging door, of a false bottom or goods-support, a hinged connection between said door and said bottom or support, guide-rods upon the bottom of said case, and antifriction devices upon said bottom or support and engaged with said guide-rods, substantially as described.

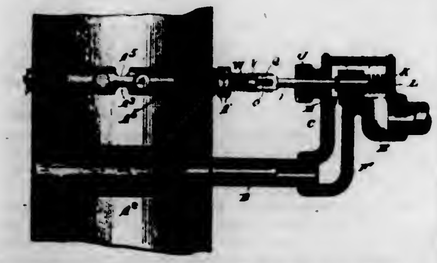
812,714. MATCH-BOX. WILLIAM ALPERT, Richardton, N. D. Filed Sept. 30, 1905. Serial No. 280,906.

Claim.—1. In a device of the class described, a box having a hinged cover, a delivery member journaled at the front of the box and provided with a match-receiving recess, and a tension element terminally engaged respectively with the cover and delivery member.

2. In a device of the class described, a box including rear and end walls, a cover hinged to the box, a delivery member rotatively journaled at the front of the latter and provided with a match-receiving recess, and an elastic element terminally engaged with the cover and delivery member, said element being confined between its ends at a point adjacent the juncture of the rear wall and bottom of the box.

3. In a device of the class described, a box including rear and end walls, a cover having laterally-extending portions, a pintle extended through the box and engaged with said portions for hinging the cover to the box, a delivery member rotatively journaled at the front of the latter and provided with a match-receiving recess, and an elastic element engaged between its ends with a pivoting-rod and terminally engaged with the cover and delivery member.

812,715. CUT-OFF VALVE FOR GAS OR OIL BURNERS. ALONZO ASHCRAFT, Fort Smith, Ark. Filed July 7, 1905. Serial No. 268,669.



Claim.—1. The combination with a fluid-fuel burner, of a reciprocating valve, a tubular thermal member, means connecting the thermal member with the valve, and means whereby the thermal member and valve connecting means may be secured, said securing means being adapted to release the valve upon expansive action of the thermal member, substantially as described.

2. The combination with a fluid-fuel burner, of a reciprocating valve, a tubular thermal member, means connecting the valve with the thermal member, means whereby the valve is released, means whereby the valve is adjusted to cutting-off position, and means adapted to be set gaging operative action of the expansive member, substantially as described.

3. The combination with a fluid-fuel burner, of a tubular thermal member, a casing having a chamber and passage-ways leading to the burner, a reciprocating valve in the casing-chamber, having adjustment to open and cutting-off position, a stem extending from the valve, means extending from the valve-stem to the thermal member, means whereby the valve may be secured to open adjustment, the valve-securing means being adapted to be automatically released, upon expansive action of the thermal member, and means operating to adjust the valve to cutting-off position upon release of its securing means, substantially as described.

4. The combination with a fluid-fuel burner, of a thermal member, a casing having a chamber and passage-ways leading to the burner, a valve in said chamber, having a projecting stem, a spring adapted for forcing the valve to cutting-off position, a lever having suitable pivotal support at one end, and attachment to the valve-stem, a rod having connection with the lever, at a point between its pivotal support and the point of the valve-stem connection, the rod being extended suitable for operative connection with the thermal member, and an arm supported on the free end of the lever, having an upturned hooked end, with the latter adapted for connection with a fixed device on the valve-casing, whereby the valve may be secured at open adjustment, and the hooked end of the arm be automatically disengaged, upon expansive action of the thermal member and operation of the intermediate devices, substantially as described.

5. The combination with a fluid-fuel burner, and a cut-off valve in its fluid-fuel-supply passage-way, having a suitable stem, the valve being yieldingly retained at cutting-off position, of a tubular thermal member supported to receive heat from the burner, a lever having pivotal support at one end, and near the other end, attachment with the valve-stem, a reciprocal rod having one end attached to the lever, between the points of its pivotal support and connection therewith of said valve-stem, and a collar on the reciprocal rod, the free end of said rod being extended into the adjacent open end of the tubular thermal member, substantially as described.

6. The combination with a fluid-fuel burner, and a cut-off valve in its fluid-fuel-supply passage-way, having a suitable stem, the valve being yieldingly retained at cutting-off position, of a tubular thermal member supported adapted for receiving heat from the burner, and having its body suitably perforated, a lever having pivotal support at one end, and near the other end, attachment with the valve-stem, a reciprocal rod having one end attached to the lever, between the points of its pivotal support and connection therewith of said valve-stem, and jam-nuts on the reciprocal rod, the free end of said rod being extended into the adjacent open end of the tubular thermal member, substantially as described.

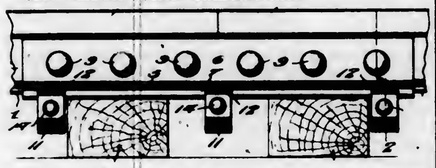
7. The combination with a fluid-fuel burner and a yielding valve in the fuel-supply passage-way, of a thermal member, consisting of a tubular body, means connecting the thermal member with the valve, means for holding the valve open, adapted for automatic release thereof, and an adjustable device interposed between the thermal member and valve devices, whereby to time and gage action of the valve, substantially as described.

812,716. PUMP SPRING ATTACHMENT. JAMES O. BAIN, Wasca, Minn. Filed June 30, 1905. Serial No. 267,837.

Claim.—1. In pump spring attachments, a base-plate having a central aperture and a series of spring-receiving apertures around it; a top plate having a central aperture and spring-receiving apertures to correspond with those of the base-plate: the said top plate being provided with a fixed jaw located at one side of the central aperture; the said fixed jaw having the described rectangular-cornered notch in its face and a plane surface at each side of the notch; the said fixed jaw further having shouldered recesses to hold bolts by their heads; a movable jaw having a plane face and a rectangular notch therein at one side and a curved notch at the other side, and having bolt-holes, one at each side of the said notches, and screw-bolts fitted to engage the said recesses and to draw the movable jaw toward the fixed jaw.

2. In pump spring attachments, a lower plate having a central aperture, and holes around it to receive springs; an upper plate having a central aperture and holes around it to receive springs, and further having a fixed jaw with a rectangular-cornered notch in one face, also having shouldered recesses for bolt-heads; and a movable jaw having a rectangular-cornered notch in one side and a curved notch at the other side, also having bolt-holes through it; the two plates and the movable jaw each having the sides of its apertures substantially parallel, as and for the purpose specified.

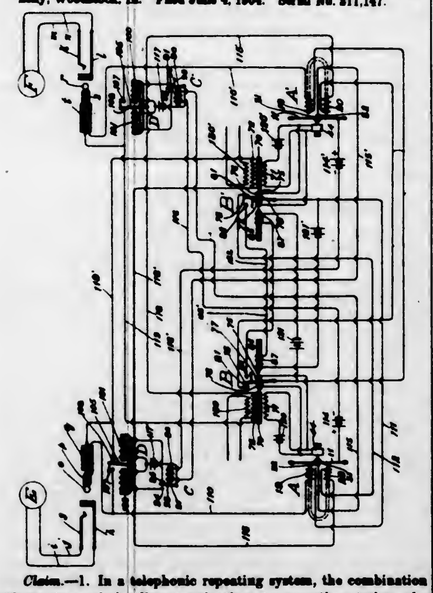
812,717. RAILWAY-RAIL JOINT. HOMER F. BARBER, Salem, Ohio. Filed Oct. 10, 1905. Serial No. 282,511.



Claim.—1. In a device of the character described, the combination of the meeting ends of two railway-rails, joint members, and a clamp comprising members, each having its inner opposing end inclined upwardly in a reverse direction.

2. In a device of the character described, the combination of the meeting ends of two railway-rails, joint members having their vertically-disposed portions bowed, and clamps comprising members, each having its inner opposing end inclined upwardly in a reverse direction, substantially as shown and described.

812,718. TELEPHONIC REPEATING SYSTEM. ADOLPH J. P. BERTSCHY, Woodstock, Ill., assignor of one-fourth to Charles H. Donnelly, Woodstock, Ill. Filed June 4, 1904. Serial No. 211,147.



Claim.—1. In a telephonic repeating system, the combination with two transmission-lines terminating at a repeating-station, of a repeating-relay for each line, each comprising suitable receiving-coils, a transmitter and a common vibratory diaphragm, a transformer associated with each repeating-relay, the primary circuit of each transformer being controlled by the transmitter of the associated repeating-relay, an electromagnetic switching device for each repeating-relay, each having an actuating-winding connected in shunt of the transmitter thereof, each of said switching devices serving normally to maintain the closure of a break in the circuit of the receiving-coils of the other repeating-relay but when actuated due to the actuation of the associated transmitter to open the break in said receiver-circuit, each of said switching devices serving also when actuated to close a local circuit through an electromagnetic safety device associated with the other switching device, thereby insuring the maintenance of its normal circuit connections, and an auxiliary switching device associated with the diaphragm of each repeating-relay and each maintaining normally a closed circuit through associated electromagnetic switching mechanism, said electromagnetic switching mechanism serving normally to maintain an electrical connection between the receiving-coils of the other repeating-relay and its transmission-line and to maintain a break in an otherwise completed circuit containing this other transmission-line and the secondary coil of the transformer associated with that relay which controls the given switching mechanism, but serving when deënergized due to the opening of the circuit at said auxiliary switching mechanism upon the vibration of the associated relay-diaphragm to close the circuit connection between said transmission-line and the secondary coil of said transformer and to open the circuit connection between the same transmission-line and the receiving-coils of its repeating-relay.

2. In a telephone repeating system, the combination with an electromagnet connected in a receiving-circuit, of a transmitter for controlling currents in the sending-circuit, a vibratory diaphragm common to said electromagnet and said transmitter, and an auxiliary switching device controlled by said diaphragm to cause the closure of a break in the sending-circuit.

3. In a telephonic repeating system, the combination with an electromagnet connected in a receiving-circuit, of a transmitter for controlling currents in the sending-circuit, a vibratory diaphragm common to said electromagnet and said transmitter, normally closed switch-contacts associated with said diaphragm, an electromagnetic switching device controlled by said switch-contacts, and means whereby the vibration of said diaphragm causes a break in the connection between said switch-contacts to deënergize said electromagnetic switching device, said switching device serving normally to maintain a break in the sending-circuit but upon deënergization to cause the closure of said break in the sending-circuit.

4. In a telephone repeating system, the combination with electromagnetic receiving-coils connected in a receiving-circuit, of a transmitter for controlling currents in the sending-circuit, a vibratory diaphragm common to said electromagnetic receiving-coils and said transmitter, a relay having one electromagnet adapted upon energization to cause the associated armature to assume one of its alternative positions, and a second electromagnet adapted upon energization to cause the armature to assume the other of its alternative positions, the armature remaining in the position which it has assumed due to the energization of either electromagnet until the other electromagnet is energized, a second relay adapted upon energization to cause a closure of the circuit through the first electromagnet of the first said relay, and upon deënergization to cause the closure of a local circuit through the second electromagnet of the first said relay, and auxiliary switch-contacts associated with said diaphragm, said switch-contacts serving normally to maintain the closure of a circuit through the second said relay, but upon the vibration of said diaphragm to interrupt the circuit through said relay, the energization of the second electromagnet of the first said relay serving to close a break in the continuity of the sending-circuit.

5. In a telephone repeating system, the combination with electromagnetic receiving-coils connected in a receiving-circuit, of a transmitter for controlling currents in the sending-circuit, a vibratory diaphragm common to said electromagnetic receiving-coils and said transmitter, a relay having one electromagnet adapted upon energization to cause the associated armature to assume one of its alternative positions, and a second electromagnet adapted upon energization to cause the armature to assume the other of its alternative positions, a second relay adapted upon energization to cause a closure of the circuit through the first electromagnet of the first said relay and upon deënergization to cause the closure of a local circuit through the second electromagnet of the first said relay, and auxiliary switch-contacts associated with said diaphragm, said switch-contacts serving normally to maintain the closure of a circuit through the second said relay but upon the vibration of said diaphragm to in-

terrupt the circuit through said relay, the energization of the second electromagnet of the first said relay serving to close a break in the continuity of the sending-circuit.

by the receiving and transmitting parts whereby the actuation of one of said relays serves to open a circuit through the receiver-coils of the other relay

operating the parts in synchronism and in timed relation with each other.

terrupt the circuit through said relay, the energization of the second electromagnet of the first said relay serving to close a break in the continuity of the sending-circuit.

6. In a telephonic repeating system, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay having its receiving-coils normally connected with one line and its transmitter adapted for the control of voice-currents in the other line, and electromagnetic switching mechanism controlled by said repeating-relays, whereby the actuation of one of said relays serves to open the circuit through the receiving-coils of the other relay.

7. In a telephonic repeating-station, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay having its receiving-coils normally connected with one line and its transmitter adapted for the control of voice-currents in the other line, and electromagnetic switching mechanism controlled by said repeating-relays, whereby the actuation of one of said relays serves to open the circuit through the receiving-coils of the other relay and to close the transmitting-circuit of the first-named relay.

8. In a telephonic repeating system, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay having its receiving-coils normally connected with its line and its transmitter adapted for the control of voice-currents in the other line, and switching mechanism controlled by said repeating-relays, whereby the actuation of one of said relays serves to cause a plurality of breaks in the circuit through the receiving-coils of the other relay.

9. In a telephonic repeating system, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay having its receiving-coils normally connected with its line and its transmitter adapted for the control of voice-currents in the other line, and switching mechanism controlled by said repeating-relays, whereby the actuation of one of said relays serves to cause a plurality of breaks in the circuit through the receiving-coils of the other relay and to close the transmitting-circuit of the first-named relay.

10. In a telephonic repeating system, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay having its receiving-coils connected with its line and its transmitter adapted to control inductively the currents in the other line, and an electromagnetic switching device connected in shunt of said transmitter and serving upon partial deënergization due to a decrease in resistance in the transmitter to break the circuit through the receiving-coils of the other relay.

11. In a telephonic repeating system, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay having its receiving-coils connected with its line and its transmitter adapted to control inductively the currents in the other line, an electromagnetic switching device connected in shunt of said transmitter and serving upon partial deënergization due to a decrease in resistance in the transmitter to break the circuit through the receiving-coils of the other relay, and auxiliary switch-contacts controlled by the vibration of the diaphragm of each repeating-relay, said switch-contacts serving to control the transmitting-circuit of the first-named relay.

12. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, an induction-coil for each repeating-relay, the circuit for the primary coil of each induction-coil being controlled by the transmitter of one of said repeating-relays and the secondary coil of each induction-coil being adapted for connection with one of said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from one line to its repeating-relay causes a connection of the secondary coil of the associated induction-coil with the other transmission-line.

13. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, an induction-coil for each repeating-relay, the circuit for the primary coil of each induction-coil being controlled by the transmitter of one of said repeating-relays, the secondary coil of each induction-coil being adapted for connection with one of said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from one line to its repeating-relay causes a connection of the secondary coil of the associated induction-coil with the other transmission-line and causes a break in the connection between this other transmission-line and the receiving-coils of its repeating-relay.

14. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, an induction-coil for each repeating-relay, the circuit for the primary coil of each induction-coil being controlled by the transmitter of one of said repeating-relays, the secondary coil of each induction-coil being adapted for connection with one of said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from one line to its repeating-relay causes a connection of the secondary coil of the associated induction-coil with the other transmission-line, and causes a double break in the circuit of the receiving-coils associated with this other transmission-line.

15. In a telephonic repeating system, the combination with a pair of repeating-relays each consisting of a receiver and a transmitter part, of means jointly controlled by said receiver and transmitter part for causing the actuation of one relay to render the other relay inoperative.

16. In a telephonic repeating system, the combination with a pair of repeating-relays, each comprising a transmitter portion and a receiver portion and a vibratory member common to both, of switching means associated with said vibratory member, and an electrical circuit controlled by said switching means, whereby the vibration of the vibratory member of one repeating-relay renders the other relay inoperative.

17. In a telephonic repeating system, the combination with a pair of repeating-relays, each comprising a transmitter portion and a receiver portion and a vibratory member common to both, of normally closed switch-contacts associated with said vibratory member, and means whereby the vibration of said vibratory member due to voice-currents traversing the associated receiver portion causes the actuation of said switch-contacts to cause a break in the receiver-circuit of the other repeating-relay.

18. In a telephonic repeating system, the combination with a pair of repeating-relays, each comprising a transmitter portion and a receiver portion and a vibratory member common to both, of normally closed switch-contacts associated with said vibratory members and means whereby the vibration of said vibratory member due to currents traversing the associated receiver portion causes an actuation of said switch-contacts to close the transmission-circuit for the associated transmitter.

19. In a telephonic repeating system, the combination with a pair of repeating-relays, each comprising a transmitter portion and a receiver portion and a vibratory member common to both, of normally closed switch-contacts associated with said vibratory member, and means whereby the vibration of said vibratory member due to currents traversing the associated receiver portion causes an actuation of said switch-contacts to close the transmission-circuit for the associated transmitter and to cause a break in the receiver-circuit of the other repeating-relay.

20. In a telephonic repeating system, the combination with two telephone transmission-circuits, of a repeating-relay for each circuit adapted to repeat into the other circuit, each relay consisting of a receiver and a transmitter part, and electromagnetic means jointly controlled by the receiver and transmitter parts whereby the actuation of one repeater destroys the connection between the other repeater and its transmission-circuit.

21. In a telephone repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line consisting of a receiver and a transmitter part and having its receiving-coils normally connected in circuit with its line, and electromagnetic means jointly controlled by the receiving and transmitting parts whereby the passage of voice-currents through the receiving-coils of one repeating-relay causes a disconnection of the receiving-coils of the other repeating-relay from its transmission-line.

22. In a telephone repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line consisting of a receiver and a transmitter part and having its receiving-coils normally connected in circuit with its line, and electromagnetic means jointly controlled by the receiving and transmitting parts whereby the passage of voice-currents through the receiving-coils of one repeating-relay causes a disconnection of the receiving-coils of the other repeating-relay from its transmission-line and causes a connection of the transmitting-circuit of the first said relay with the transmission-line from which the receiving-coils of the other relay are disconnected.

23. In a telephonic repeating system, the combination with two transmission-lines leading to a repeating-station, of a repeating-relay for each line, each relay consisting of a receiving and a transmitting part and having its receiver-coils normally connected with its line, and electromagnetic switching mechanism jointly controlled by the receiving and transmitting parts whereby the actuation of one of said relays serves to open a circuit through the receiver-coils of the other relay.

24. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, transformer means for inductively transferring telephonic voice-currents from one line to the other, the primary currents through said transformer means being controlled by said repeating-relays, the secondary windings of said transformer means being adapted for connection with said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from one line to its repeating-relay causes the closure of a telephonic circuit including said transformer means from the transmitter portion of said repeating-relay to the other transmission-line.

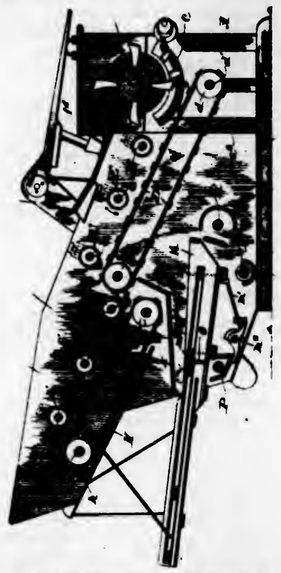
25. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, transformer means for inductively transferring telephonic voice-currents from one line to the other, the primary currents through said transformer means being controlled by said repeating-relays, the secondary windings of said transformer means being adapted for connection with said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from one line to its repeating-relay causes the closure of a telephonic circuit including said transformer means from the transmitter portion of said repeating-relay to the other transmission-line and causes a break in the connection between this other transmission-line and the receiving-coils of its repeating-relay.

26. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, transformer means for inductively transmitting telephonic voice-currents from one line to the other, the primary currents through said transformer means being controlled by said repeating-relays, the secondary windings of said transformer means being adapted for connection with said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from either line to its repeating-relay causes the closure of a circuit from the secondary windings of said transformer means to the other transmission-line.

27. In a telephonic repeating system, the combination with a pair of transmission-lines terminating at a repeating-station, of a repeating-relay for each line, transformer means for inductively transmitting telephonic voice-currents from one line to the other, the primary currents through said transformer means being controlled by said repeating-relays, the secondary windings of said transformer means being adapted for connection with said transmission-lines but normally disconnected therefrom, and means whereby the passage of telephonic voice-currents from either line to its repeating-relay causes the closure of a circuit from the secondary windings of said transformer means to the other transmission-line and causes a break in the connection between this other transmission-line and the receiving-coils of its repeating-relay.

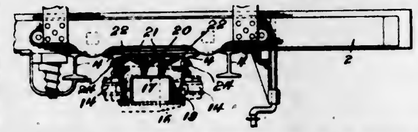
812,719. THRESHING-MACHINE. WILEY BRENTON, Carlisle, Ind. Filed June 20, 1905. Serial No. 266,101.

Claim.—1. In a threshing-machine, the combination of a frame, a cylinder journaled in the frame, a concave supported below the cylinder, an endless apron supported behind and beneath the cylinder and inclined upwardly with respect thereto, means for moving the apron, a plurality of toothed cylinders journaled in the frame above the apron and coöperating with the upper run thereof, means for adjusting the cylinders to and from the apron, means for rotating the cylinders in the same direction at the upper run of the apron and at a higher rate of speed, a second endless apron supported beneath the first apron, and spaced apart longitudinally therefrom, a grain-board beneath the apron, means for moving the apron, a toothed cylinder journaled above the second apron and coöperating with the upper run thereof, means for adjusting the cylinder to and from the apron, means for rotating the cylinder in a direction opposite to the movement of the upper run of the apron, and at a higher rate of speed, a plurality of toothed cylinders journaled behind the first cylinder and coöperating with the upper run of the apron, means for rotating the cylinders in the same direction as the upper run of the apron, and at a higher rate of speed, means for adjusting the cylinders to and from the apron, a riddle beneath the adjacent ends of the aprons, a grain-board secured to the forward end of the riddle, a shoe beneath the riddle, means for vibrating the shoe, and means for operating the parts in synchronism and in timed relation with each other.



2. In a threshing-machine, the combination of a frame, a cylinder journaled in the frame, an endless apron supported below the cylinder and inclined with respect thereto, means for moving the apron, a plurality of toothed cylinders coöperating with the upper run of the apron, means for rotating the cylinders in the same direction as the movement of the upper run of the apron and at a higher rate of speed, a second endless apron supported beneath the first apron and spaced apart longitudinally therefrom, a grain-board beneath the apron, means for moving the second apron, a toothed cylinder supported above the second apron and coöperating with the upper run thereof, means for rotating the cylinder in a direction opposite to the movement of the upper run of the apron, and at a higher rate of speed, a second cylinder behind the first cylinder and coöperating with the upper run of the apron, means for rotating the second cylinder in the direction of movement of the upper run of the apron, and at a higher rate of speed, a vibrating shoe below the apron, means for vibrating the shoe, and means for actuating the parts in timed relation with respect to each other.

812,720. CENTER-STEM GUIDE FOR CAR-BODIES. BENJAMIN S. BROWN, Altoona, Pa. Filed July 20, 1905. Serial No. 270,480.



Claim.—1. In a car-body, the combination with the base-frame and the platform-extension beams, of a center-stem guide consisting of a single casting supporting the carrier-iron and provided with an integral top-fastening piece secured to the platform-sill, and with flat end bracket extensions secured to the sides of adjacent platform-extension beams.

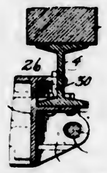
2. In a car-body, the combination with the base-frame and the platform extension having I-beams, and the center stem, of a center-stem guide consisting of a single casting fastened to the platform-sill and also to the adjacent I-beams.

3. In a car-body, the combination with the base-frame and platform extension having I girders or beams, and the center stem, of a center-stem guide consisting of a single casting supporting the carry-iron and provided with a top-fastening base secured to the platform-sill and with end bracket extensions secured to adjacent I girders or beams.

4. In a car-body, the combination with the base-frame and platform extension having I-girders, and the center stem, of a center-stem guide consisting of a single casting supporting the carry-iron and provided with a top-fastening base secured to the platform-sill, and with tapering end bracket projections having vertical flat attaching-bases, said bracket extensions registering in and secured to the sides of adjacent I-girders.

5. In a car-body, the combination with the base-frame and platform extension having I-girders, and the center stem, of a center-stem guide consisting of a single casting supporting at the bottom the carry-iron for the center stem, said center-stem guide consisting of flanged and webbed casting provided at the top with a fastening-base secured to the platform-sill, with end tapering bracket projections registering in and secured to adjacent I-girders, and terminal flanged hanger-legs for the carry-iron.

812,721. **DRAFT-RIGGING MECHANISM FOR CARS.** BENJAMIN S. BROWN, Altoona, Pa. Filed Nov. 14, 1905. Serial No. 287,305.



Claim.—1. In a car-body, a base-frame having girders, a center stem carrying a pivotal coupling-head, side centering-stems connected with the coupling-head, and a side-stem-centering bracket associated with each stem and having integral therewith a hanger-saddle embracing a girder of the frame, and a perforated abutment-lug for the stem and the spring thereof.

2. In a car-body, the base-frame having I-girders, the center stem carrying a pivotal coupling-head, the side centering-stems connected with the coupling-head, and a side-stem-centering bracket associated with each stem and consisting of a single casting having a socketed hanger-saddle fitting and secured to an I-girder, and a perforated abutment-lug for the stem and the spring thereof.

3. In a car-body, the combination with the base-frame having I-girders, a center stem carrying the pivotal coupling-head, and the side centering-stems connected with the coupling-head, of a side-stem-centering bracket associated with each stem consisting of a single casting having a perforated abutment-lug for the stem and its spring, said casting being also provided with a web-attaching flange to be secured to the web of an I-girder, and a horizontal fastening-base secured to the base-flange of the same girder.

4. In a car-body, the combination with the base-frame having I-girders, the center stem carrying the coupling-head, and the side stems connected with said head, of a side-stem-centering bracket associated with each stem and consisting of a single casting having a vertically-arranged body-plate provided at one side with a plurality of integrated reinforcing-webs, and at the top with a socketed hanger-saddle fitting over and fastened to an I-girder, said body-flange being further provided with a perforated abutment-lug for the stem and its spring.

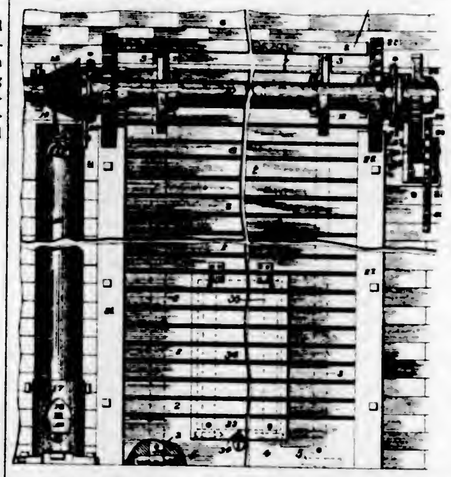
812,722. **ROLLING DOOR OR SHUTTER AND MEANS FOR OPERATING THE SAME.** JOHN CAHILL, Norfolk, Va. Filed May 29, 1905. Serial No. 262,236.

Claim.—1. A vertically-disposed flexible door or shutter consisting of a series of horizontal wooden slats and interposed heavy metallic slats loosely threaded on tapes, whereby a tight joint between the slats below the metallic slats will be at all times maintained.

2. A vertically-disposed flexible shutter or door consisting of a series of wooden slats, a heavy metallic slat mounted on top of said wooden slats, a smaller series of wooden slats mounted on top of the aforesaid metallic slat, another heavy metallic slat surmounting the last-mentioned metallic slat, and a top bar, all threaded on tapes, the wooden and metallic slats being loosely threaded thereon and the said top bar and tapes adapted to be secured to a rotary shaft.

3. In a device of the class described, a flexible door or shutter adapted to close an opening in a wall, a shaft to which said door or shutter is secured, supports for said shaft, and means for causing the shaft to move transversely toward the wall as the door or shutter uncoils, and away from the wall as it is coiled.

4. In a device of the class described, a flexible door or shutter adapted to close an opening in a wall, a shaft to which the upper end of the door or shutter is secured, supports for said shaft, means for causing the shaft to move transversely toward the wall with respect to its supports as the door or shutter is uncoiled, and away from the wall as it is coiled and means attached to one end of the shaft for causing rotation of the same.



5. In a device of the class described, a flexible door or shutter adapted to close an opening in a wall, a shaft to which said door or shutter is secured, supports for said shaft, cams mounted on said shaft adjacent to its supports, and coöperating means on said support for engaging said cams to cause the shaft to move transversely with respect to its supports, away from the wall when the flexible door is coiled and toward the wall as it is uncoiled.

6. In a device of the class described, a flexible door or shutter adapted to close an opening in a wall, a shaft to which said door or shutter is secured, supports for said shaft, spiral cams rigidly secured to said shaft adjacent to its supports, and projections on said supports engaging the spiral cams and coöperating therewith to cause the shaft to move transversely with respect to its supports, away from the wall as the door or shutter is coiled and toward the wall as it is uncoiled.

7. In a device of the class described, a flexible door or shutter adapted to close an opening in a wall, a shaft to which said door or shutter is secured, supports for said shaft, a spirally-grooved cone-pulley secured to one end of said shaft, an expansion-spring anchored at one end and a flexible connection between the cone-pulley and the free end of the expansion-spring, the shaft to revolve and move transversely on its supports toward the wall as the door or shutter uncoils, and away from the wall as it is coiled.

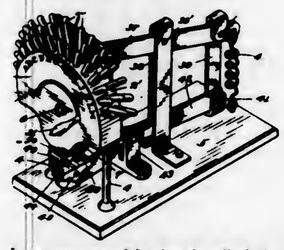
8. In a device of the class described, a flexible door or shutter, a shaft to which said door or shutter is secured, supports or brackets for said shaft, a spirally-grooved cone-pulley secured to one end of said shaft, an expansion-spring suitably anchored at one end, a flexible connection between the cone-pulley and the free end of the expansion-spring, and means for regulating the tension of the spring.

9. In a device of the class described, a flexible door or shutter adapted to close an opening in a wall, a shaft rotatably mounted in suitable supports, drums rigidly secured to said shaft, said door or shutter rigidly secured at its upper end to said drums, and means for causing the shaft to rotate and move transversely on its supports, away from the wall as said door or shutter is coiled and toward the wall as it is uncoiled.

10. In a device of the class described, a flexible door or shutter consisting of a series of slats threaded on tapes, and a top bar secured to the upper ends of the tapes, leaving a space between the main body of the door or shutter and its top bar, a shaft to which said top bar is rigidly secured, supports or brackets for said shaft, said shaft being rotatably mounted in said supports, and adapted to move transversely in said supports when the door or shutter is coiled and uncoiled.

11. In a device of the class described, a flexible door or shutter, a shaft, supports or brackets for said shaft, drums rigidly secured to said shaft, said door or shutter rigidly secured at its upper end to the said drums, spiral-groove cams secured to said shaft adjacent to said supports or brackets, projections on said supports or brackets engaging the spiral-groove cams, a spirally-threaded cone-pulley secured to one end of said shaft, an expansion-spring vertically disposed and suitably anchored at its lower end, a flexible connection secured at one end to the upper end of the expansion-spring and at its other end to the spirally-grooved cone-pulley, and means for rotating said shaft, whereby the said shaft will be caused to rotate and move transversely in its supports or brackets, when the door or shutter is coiled and uncoiled.

812,723. **CLOTHES-MARKING APPARATUS.** JOHN D. CALDWELL and NELS A. SORENSON, Seattle, Wash., assignors to Caldwell-Sorenson Linnograph Co., Seattle, Wash., a Corporation of Washington. Filed June 27, 1904. Serial No. 214,267.



Claim.—1. In an apparatus of the class described, the combination with movable marking mechanism, of a platen, means for simultaneously moving the platen and marking mechanism in the same direction but at different rates of speed, whereby they will ultimately come into contact.

2. In apparatus of the class described, the combination with marking mechanism, of a platen movable simultaneously with the marking mechanism and in the same direction but at a slower rate of speed and coöperating therewith against the action of a retracting-spring tending to separate them.

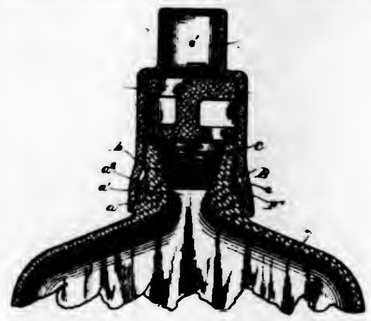
3. In an apparatus of the class described, the combination with movable marking mechanism and the inking mechanism therefor, of a platen, a pivoted lever on which said platen is mounted, a pivoted lever connected to the marking mechanism and adapted to move the same, and connections between said two levers, the said levers being so constructed and fulcrumed that the movement of the platen will impart movement in the same direction but at a greater rate of speed to the marking mechanism,

4. In apparatus of the class described, the combination with rotatable disks provided with peripheral type, means for revolubly moving said type individually and predeterminately into printing positions, and a platen, of mechanical connections between the disks and the platen whereby a downward movement of the platen will impart an accelerated printing movement in the same direction to the disks.

5. In apparatus of the class described, the combination of type-disks rotatably mounted in a movable head, a toothed wheel integral with each disk, a segmental gear severally provided with an arm for each toothed wheel, an arc member for each said arm and carrying hook devices for engaging and retaining the respective arms against the action of springs, said springs, a series of keys for each disk said keys being provided with means coacting with the arc members for disengaging the respective said arms from said hook devices, said arms also being adapted when depressed to limit the setting movement of and engage the arms whereby the type corresponding with a depressed key will be stopped in its revolution and retained in printing position, and means for disengaging the arms from the engaged keys.

812,724. **NON-REFILLABLE BOTTLE.** CHARLES E. CARROLL, Newport, Ark. Filed Jan. 23, 1905. Serial No. 242,413.

Claim.—1. In combination, a bottle having a conical neck provided with an inverted cone-shaped longitudinal opening therethrough and a circumferential rectangular groove, a cone-shaped valve resting in the opening and provided with a longitudinal perforation, a coil-spring resting on the valve, a cylinder resting upon the spring and the free edges of the neck, and provided with a spirally-arranged opening connecting its upper and lower surfaces, a cylindrical casing encircling the cylinder and neck, and having an internal circumferential groove registering with the groove of the neck, and a spring-keeper within the registering grooves, and provided with teeth, the alternate teeth bent inwardly and comprising three similar series each composed of teeth gradually decreasing in length.



2. In combination, a bottle having a conical neck provided with a circumferential groove, means within the neck for permitting the outward passage and preventing the inward passage of liquid, a cylinder resting upon the free edge of the neck and provided with a spiral groove connecting its upper and lower surfaces, a casing encircling the cylinder and neck and provided with a circumferential groove registering with the groove in the neck, and a spring-keeper engaging the registering grooves, the said keeper provided with teeth for engaging the registering grooves, the alternate teeth bent inward and comprising three similar series of teeth gradually decreasing in length.

3. In combination a bottle having a neck provided with a circumferential groove, means within the neck for permitting the outward passage and for preventing the inward passage of liquid, a casing inclosing said means and encircling the neck and provided with a groove registering with the groove of the neck, a spring-keeper within the registering grooves, and comprising a ring with depending teeth, the alternate teeth bent inward, and comprising a plurality of similar series of teeth of gradually-decreasing length.

4. In combination a bottle having a neck provided with a circumferential groove, means within the neck for permitting the outward passage and for preventing the inward passage of liquid, a casing inclosing said means and encircling the neck and provided with a groove registering with the groove of the neck, and means within the registering grooves for securing the casing to the neck, comprising a ring, and means connected with the ring for engaging the groove in the casing at different elevations with respect to the groove of the neck.

5. In combination, a bottle having a neck, means within the neck for permitting the outward passage and for preventing the inward passage of liquid, a casing inclosing the said means and encircling the neck, and means between the neck and the casing, for securing the latter to the former, comprising a ring engaging the neck, and means whereby said ring may engage the casing at different elevations with respect to the neck.

6. In combination a bottle having a neck, means within the neck for permitting the outward passage and for preventing the inward passage of liquid, means for retaining said means within the neck, comprising a casing inclosing the neck, means between the casing and the neck for retaining the former upon the latter, comprising a means engaging the neck and means connected therewith for engaging the casing at different elevations with respect to the neck.

812,725. **SURFACE-CONTACT SYSTEM.** FRANK H. CASE, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 22, 1904. Serial No. 217,600.

Claim.—1. In an electric-railway system, a feeder, a pick-up switch, a dynamo-electric machine for closing said switch, and means operative upon the closing of said switch to stop said machine.

2. In an electric-railway system, a feeder, a pick-up switch, a current-generator for closing said switch, means for driving said generator, and means operable upon the closing of the switch to stop the generator.

3. In an electric-railway system, a feeder, a generator, two circuits therefrom, a pick-up switch operated by current in one of said circuits, means operable upon the closing of said switch to stop the

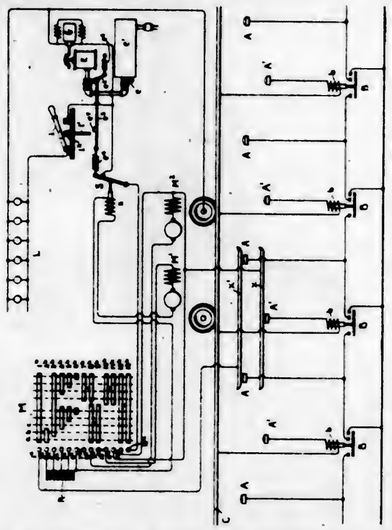
generator, and means for rendering said latter means inoperative

stop the generator and to again start it when the first circuit is in-

tor-circuit to start the generator provided the motor-controller is in

812,728. **KILN-DOOR.** NELSON R. DEPPE, Deppe, N. C. Filed

generator, and means for rendering said latter means inoperative while the second circuit remains closed.



4. In an electric-railway system, a feeder, a generator, a circuit therefrom, a pick-up switch closed by current in said circuit, means for driving said generator, and means operable upon the closing of said switch to interrupt the circuit and to stop the generator.

5. In combination, a generator, an engine for driving it, a valve for controlling the admission of compressed fluid to said engine, a generator-circuit, a switch in said circuit, and means controlled by said switch for locking said valve in its open position.

6. In an electric system, a motor, a source of current-supply, a generator, means for driving said generator, a switch for connecting said motor to said source of supply and operated by current from the generator, together with means operable upon the closing of the motor-circuit to stop the generator.

7. In an electric system, a motor and a source of current-supply therefor, a dynamo-electric machine, a switch for connecting said motor to said source of supply and operated by current from the machine, together with means operable upon the closing of the motor-circuit to stop the machine.

8. In an electric-railway system, a feeder, a pick-up contact, a dynamo-electric generator for supplying current to operate said contact, an automatically-operated switch for interrupting the current, and means operatively related to said switch for stopping the generator.

9. In an electric-railway system, a feeder, a pick-up contact, a generator for supplying current to operate said contact, a switch for interrupting the current, a second circuit from the generator having a second switch, and means operatively related to the first switch for stopping the generator when the second switch is open.

10. In combination, an electric circuit including a source of current-supply, a generator, means for driving said generator, means operated by current from said generator for completing said electric circuit, and means operable upon the completion of said circuit to stop the generator.

11. In combination, an electric circuit including a source of current-supply, a dynamo-electric generator, means operated by current from said generator for completing said electric circuit, and means operable upon the completion of said circuit to stop the generator.

12. In combination, an electric circuit including a source of current-supply, a dynamo-electric generator, means operated by current from said generator for completing said electric circuit, and means operable upon the completion of said circuit to break the generator-circuit and to stop the generator.

13. In combination, an electric circuit including a source of current-supply, a generator, means for driving said generator, means operated by current from said generator for completing said electric circuit, and means operable upon the completion of said circuit to stop the generator and to again start it when the first circuit is interrupted.

14. In combination, an electric circuit including a source of current-supply, a dynamo-electric generator, means operated by current from said generator for completing said electric circuit, and means operable upon the completion of said circuit to stop the generator until said circuit is again interrupted.

15. In combination, an electric circuit including a source of current-supply, a dynamo-electric generator, means operated by current from said generator for completing said electric circuit, and means operable upon the completion of said circuit to interrupt the generator-circuit and stop the generator while said first circuit remains closed.

16. In combination, an electric circuit including a source of current-supply, a generator, means operated by current from said generator for completing said electric circuit and means operable upon the completion of said circuit to interrupt the generator-circuit and also to stop the generator, an auxiliary circuit from said generator, and means for preventing the stopping of the generator while said auxiliary circuit remains closed.

17. In combination, an electric generator and its engine, a valve for controlling the admission of compressed fluid to the engine, a generator-circuit and a switch therein, an operative connection between said valve and said switch, an auxiliary generator-circuit provided with a circuit-closing device, and interlocking means between the valve and said circuit-closing device for holding the valve against movement in one of its positions.

18. In combination, an electric generator and its engine, a valve for controlling the admission of compressed fluid to the engine, a generator-circuit and a switch therein, an operative connection between said valve and said switch, an auxiliary generator-circuit provided with a switch, and interlocking means between the latter switch and the valve whereby the valve is at times held against movement during the operation of the first switch.

19. In combination, an electric generator and its engine, a valve for controlling the admission of compressed fluid to the engine, a generator-circuit and a switch therein, an operative connection between the valve and the switch whereby the opening of the switch causes the valve to be opened, a second generator-circuit provided with a switch, and interlocking means between said latter switch and said valve, whereby the valve is prevented from being opened upon the opening of the first switch while second switch remains closed.

20. In an electric system, an electric generator, two circuits therefor, a switch in each circuit, means connected with one of said switches for stopping the generator when the switch is opened, and an interlock which prevents such stopping of the generator while the other switch remains closed.

21. In an electric system, an electric generator and its engine, a valve for controlling the admission of compressed fluid to said engine, a generator-circuit and a switch therein, a yielding connection between the valve and switch whereby the opening of the switch closes the valve, and means for locking the valve against being closed by the switch.

22. In an electric system, an electric generator and its engine, a valve for controlling the admission of compressed fluid to the engine, two generator-circuits, a switch in each circuit, an operative connection between one of said switches and said valve whereby the switch and valve may move in unison, and means controlled by the other switch for rendering said connection inoperative.

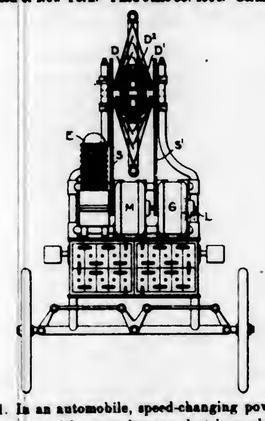
23. In an electric system, an electric generator and its engine, a valve for controlling the admission of compressed fluid to the engine, two generator-circuits, a switch in each circuit, an operative connection between one of the switches and the valve, and interlocking means between the valve and the other switch.

24. In an electric system, an electric generator and its engine, a valve for controlling the admission of compressed fluid to the engine, two generator-circuits, a resilient connection between one of said switches and the valve, and interlocking means between the valve and the other switch.

25. In an electric system, an electric circuit including a source of current-supply, a generator, means operated by current from the generator to close said circuit, and means operable upon the closing of the current to stop the generator and upon the interruption of the circuit for starting the generator.

26. In a control system, a motor-circuit including a source of current-supply, a generator, means operated by current from the generator for closing the motor-circuit, a motor-controller in the generator-circuit, and means operable upon the closing of the motor-circuit to stop the generator and upon the interruption of the motor-circuit to start the generator provided the motor-controller is in one of its running positions.

812,726. LOCKING DEVICE FOR AUTOMOBILES. ALEXANDER CHURCHWARD, New York, N. Y., assignor to General Electric Company, a Corporation of New York. Filed June 30, 1904. Serial No. 214,713.



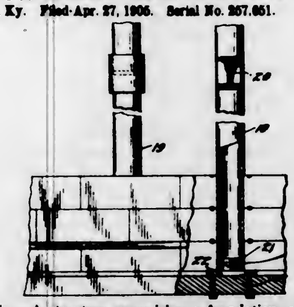
Claim.—1. In an automobile, speed-changing power-transmitting mechanism comprising two dynamo-electric machines electrically and mechanically connected, and means for locking the field and armature of one of said machines together.

2. In an automobile, speed-changing power-transmitting mechanism comprising two mechanically-connected dynamo-electric machines, one of said machines being arranged to act as a slipping clutch and to supply current generated by said slipping to the second machine, and means for locking the field and armature of the first machine together.

3. In an automobile, a prime mover, a differential gear having one member connected to said prime mover and a second to the load, a dynamo-electric machine connected to the third member of said gear, and means for locking the field and armature of said machine together.

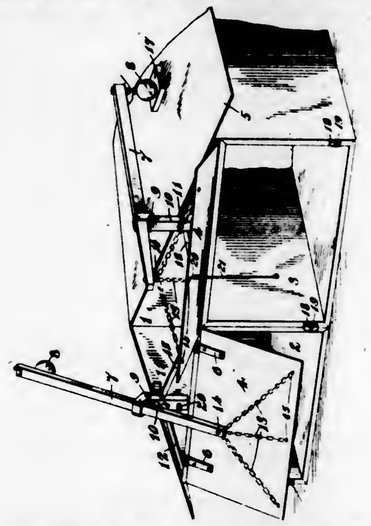
4. In an automobile, a prime mover, a differential gear having one member connected to said prime mover and a second member to the load, a dynamo-electric machine connected to one of said members, a second dynamo-electric machine connected to the third member of said gear, and means for locking the field and armature of the latter machine together.

812,727. BUILDING CONSTRUCTION. JOHN S. CULLEY, Louisville, Ky. Filed Apr. 27, 1905. Serial No. 257,651.



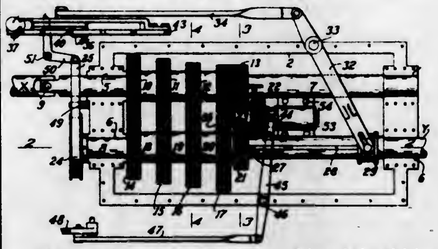
Claim.—A structure comprising a foundation, a plate bolted thereto and having an upwardly-extending stud, a wall on said foundation composed of inner and outer courses of blocks recessed on their inner sides to form a vertical passage coincident with and extending above said plate, and a tubular stud or frame-piece in and filling said passage and bearing on the said plate, the stud of the latter entering the lower end of said tubular frame-piece, said blocks having communicating grooves in their opposing sides extending around the said tubular stud or frame-piece and mortar in said grooves forming the bonds which connect the said blocks together.

812,728. KILN-DOOR. NELSON R. DEPPE, Deppe, N. C. Filed July 28, 1904. Renewed Jan. 15, 1906. Serial No. 296,734.



Claim.—A kiln or the like having a door-opening and a vertically-disposed post above said opening, a door for said opening hingedly mounted upon said structure to swing upwardly and outwardly, at the bottom, a lever fulcrumed intermediate its ends upon said post, chain connections between one end of said lever and said door, a counterbalance-weight upon the other end of said lever, a protecting-block upon said kiln for said weight, and a fastening device for securing said door in its closed position, substantially as described.

812,729. VARIABLE-SPEED DEVICE. JOHN A. DE VITO, Roxbury, Mass. Filed May 3, 1905. Serial No. 258,671.



Claim.—1. In a variable-speed device, a driven shaft; a driving-shaft; a plurality of gears rigidly mounted upon one of said shafts; and an equal number of gears rotatably mounted on the other of said shafts, each of said rotatable gears meshing with a rigid gear; in combination with means for successively causing each pair of meshing gears to rotate the driven shaft, and a brake mechanism coöperative with said means, substantially as set forth.

2. In a variable-speed device, a driven shaft; a driving-shaft; a plurality of gears rigidly mounted upon one of said shafts, one of said gears having an extra wide face; an equal number of gears rotatably mounted upon the other of said shafts, each of said rotatable gears being in mesh with a different rigid gear; a single gear rigidly mounted upon the shaft containing the rotatable gears; an auxiliary shaft, an auxiliary idler-gear slidably and rotatably mounted upon the auxiliary shaft in position to readily engage the rigid gear upon the shaft containing the rotatable gears and the rigid gear with the extra wide face simultaneously; in combination with means for causing each pair of meshing gears, and an auxiliary gear with its two rigid gears to successively impart motion to the driven shaft, substantially as set forth.

3. In a variable-speed device, a rotatable shaft; a plurality of gears rotatably mounted upon said shaft; a key member slidably

mounted upon said shaft and adapted to successively lock each of

back and to said housing, a second clamping-section hingedly mount-

mounted upon said shaft and adapted to successively lock each of said gears upon said shaft; a brake mechanism for controlling the motion of the latter and means for causing the key to engage successively the different gears, and for actuating the brake mechanism, substantially as set forth.

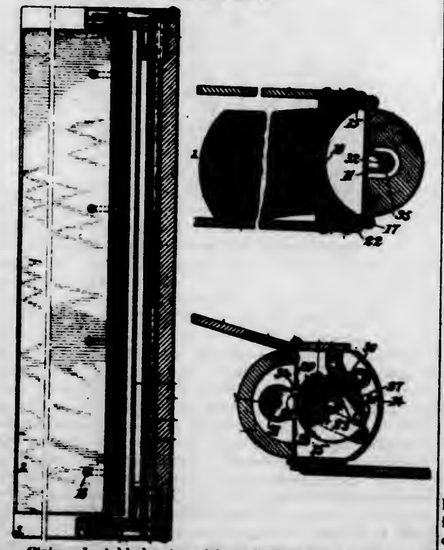
4. In a variable-speed device, a rotatable shaft, having a longitudinal keyway; a plurality of gears rotatably mounted upon said shaft and each provided with a keyway; a shift-collar slidably mounted upon said shaft; a spring-pressed, jointed key rigidly attached to said collar and adapted to move in the keyway upon said shaft and successively engage the keyways in each of said gears; in combination with means for causing the successive engagement of said key with said keyways in the gears, and mechanism coöperative with said means, for controlling the motion of the rotatable shaft, substantially as set forth.

5. In a variable-speed device, a rotatable shaft provided with a longitudinal keyway; a plurality of gears rotatably mounted upon said shaft, each provided with a keyway; a shift-collar slidably mounted upon said shaft; a spring-pressed, jointed key rigidly attached to said collar and adapted to slide in the keyway on said shaft and successively engage the keyways in said gears; in combination with a shift-lever; and a brake mechanism on said shaft adapted for operation by said shift-lever, substantially as set forth.

812,730. **GAS-CONTROLLING DEVICE.** WILLIAM T. DONNELLY, New York, N. Y., assignor to General Gas Appliance Company, New York, N. Y., a Corporation of New Jersey. Filed Dec. 20, 1904. Serial No. 237,233.

Claim.—As an article of manufacture, a gas-controlling device comprising among its members, a hollow body provided with a gas-inlet, a gas-outlet and opposite bearing-apertures of different diameters, a longitudinally-movable needle-valve mounted within said hollow body, and adapted to engage the gas-outlet to regulate and close the same, a tapered plug fitting said bearing-apertures gas-tight and extending through said hollow body, said hollow body and tapered plug being constructed to provide a space to permit the passage of gas past said plug, said plug having a hand-operating device outside of said hollow body, and operative connections between said plug and the needle-valve, for operating said valve, substantially as described.

812,731. **BINDER.** CHARLES L. DONOHOE, Santa Barbara, Cal. Filed Dec. 31, 1904. Serial No. 239,133.



Claim.—1. A binder comprising a back, a housing at one end thereof, a stationary clamping-section secured to one edge of the back and to said housing, a second clamping-section hingedly mounted on the other edge of the back, and means in said housing for locking the hinged clamping-section.

2. A binder comprising a back, a housing at one end thereof, a stationary clamping-section secured to one edge of the back and to said housing, a second clamping-section hingedly mounted on the other edge of the back, means in said housing for locking the hinged clamping-section, and a filling-pin attached to said hinged clamping-section.

3. A binder comprising a back, a housing at each end thereof, a clamping-section movably mounted at one edge of the back, a device in each housing, having connection with said clamping-section to lock the same, and an operating-shaft extending longitudinally through the back and connected with the said devices.

4. A binder comprising a back or main portion, a clamping-section movable thereon, a rocker, a connection between the rocker and clamping-section, a spring, a dog carried by the spring and coacting with the rocker, and a movably-mounted member carried by the back for flexing the spring to retract the dog.

5. A binder comprising a back or main portion, a movable clamping-section, a rocker, a connection between the rocker and clamping-section, a forked spring, means for securing the ends of the fork of the spring, a dog carried by the free portion of the spring and adapted to engage the rocker, and means coacting with the free portion of the spring to retract the dog.

6. A binder comprising a back or main portion, a movable clamping-section, a rocker, a connection between the clamping-section and rocker, a dog coacting with the rocker, a spring carrying the dog, and a cam coacting with the spring.

7. A binder comprising a back, a housing at each end thereof, a clamping-section movably mounted at one edge of the back, a device in each housing having connection with the clamping-section to lock the same, and an operating member extended longitudinally of the back and connected with both of said devices.

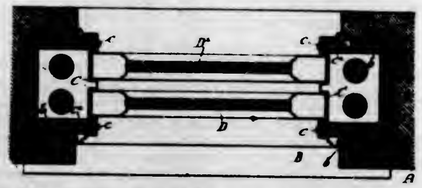
8. A binder comprising a back or main portion, a movable clamping-section, a rocker, a connection between the clamping-section and rocker, a dog coacting with the rocker, and a cam adapted to move the dog into inactive position.

9. A binder comprising a back or main portion, a movable clamping-section, a rocking disk, a connection between the rocking disk and the clamping-section, said disk having shoulders on its periphery, a stop lying between the shoulders to limit the rocking movement of the disk, and means for releasably locking the disk against movement.

10. A binder comprising a back or main portion, a movable clamping-section, a rocking disk, a connection between the rocking disk and the clamping-section, said disk having shoulders on its periphery, a stop lying between the shoulders to limit the rocking movement of the disk, means for releasably locking the disk against movement, said means comprising a dog adapted to engage the disk, a spring carrying the dog, and means coacting with the spring to move the dog into inactive position.

11. A binder comprising a back, a housing at one end thereof, a movable clamping-section carried by the back, a rocker mounted within the housing, a connection between the movable clamping-section and the rocker, means for releasably holding the rocker against movement, said means comprising a dog adapted to engage the rocker, a spring carrying the dog, and means coacting with the spring to move the dog into inactive position.

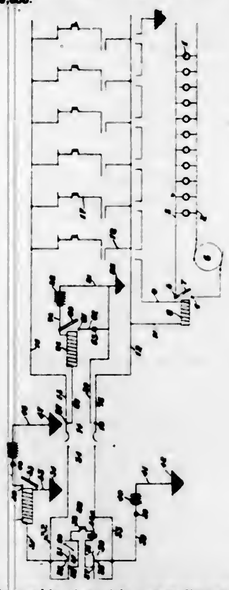
812,732. **FIREPROOF SASH STRUCTURE.** FRANK DUTCHER, Philadelphia, Pa. Filed July 14, 1905. Serial No. 269,701.



Claim.—1. The combination with a wall, of a window-frame having a body portion of non-metallic, fireproof material embedded in said wall, the side members of said body portion being hollow and open along their inner or opposing faces, a metallic jamb portion for the frame removably attached to said body portion and closing the open faces of the side members thereof, sashes for the frame, and weights for said sashes operative in said hollow body portions, substantially as described.

2. A frame consisting of top and bottom sills, and box-like side members open on their inner or opposing faces, said parts all made of fireproof, non-metallic material, with a removable metallic covering for said inner or opposing faces of said non-metallic parts, a metallic sash or sashes for the frame, and counterbalance-weights for said sash or sashes, operative in the box-like side members, substantially as described.

812,733. **POLICE SIGNALING APPARATUS.** CHARLES L. FOSTER and PETER K. HIGGINS, Los Angeles, Cal. Filed July 14, 1904. Serial No. 216,605.



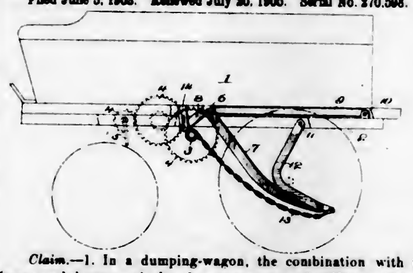
Claim.—1. In combination with a normally open signal-circuit having signals therein: a controlling-circuit patrol-boxes through which said controlling-circuit passes; a central station; a relay in said controlling-circuit having one side thereof connected in series through each patrol-box to ground and the other side connected to line leading into said central station; an armature for said relay, said armature being connected in said signal-circuit and adapted to close said circuit when said relay is energized; and means at said central station to energize said relay, whereby said signals are rendered operative.

2. In combination a normally open signal-circuit having signals therein; a central station; a normally open telephone-circuit extending from said central station; a controlling-circuit patrol-boxes through which said telephone and controlling circuits pass; a relay in said controlling-circuit having one side thereof connected in series through each patrol to ground and the other side connected to said telephone-circuit; an armature for said relay, said armature being connected in said signal-circuit and adapted to close said signal-circuit when said relay is energized; and means at said central station to energize said relay, whereby said signals are rendered operative.

3. In a signal apparatus, the combination of a central station and outlying substations at distant points; an electric controlling-circuit passing through said stations, a signal-circuit having signals therein; a complete central energy telephone-circuit passing through said substations; an automatic controlling-switch at each substation adapted to close one of the circuits passing therethrough and open the other; a relay in said controlling-circuit having one side thereof connected in series through each substation to ground and the other side connected to said telephone-circuit; an armature for said relay, said armature being connected in said signal-circuit and adapted to close said circuit when said relay is energized; and means at said central station to energize said relay whereby said signals are rendered operative.

4. In a signal system, the combination of an electric circuit having signals therein, and a central energy telephone system, comprising controlling and telephone circuits, patrol-boxes through which said circuits pass, means in said boxes to open the circuits having the signals therein, and to close the circuits of the telephone system when the door of the patrol-box is opened, an auxiliary circuit having a relay therein connected to said telephone-circuit, a battery in said auxiliary circuit, a pivoted armature for said relay, said armature being connected in said auxiliary circuit at one side of said battery, a contact connected by a branch line having a signal therein on the other side of said battery, whereby when said relay in said circuit is energized its armature engages said contact and operates said signal.

812,734. **DUMPING-WAGON.** HARRY J. FRANK, Philadelphia, Pa. Filed June 5, 1903. Renewed July 20, 1905. Serial No. 270,588.



Claim.—1. In a dumping-wagon, the combination with the frame, and the wagon-body, of a common means for lifting said body from said frame and for simultaneously tilting said body to a predetermined angle of inclination during its upward movement.

2. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of levers for lifting said body having a fixed point of connection therewith and also a variable point of connection therewith, whereby the ultimate angle of inclination of said body may be varied.

3. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of bell-crank levers for lifting said body having a fixed point of connection therewith at the intersection of the two arms composing the same, and means for variably connecting one pair of arms of said bell-crank levers with said body, whereby the ultimate angle of inclination of said body may be determined.

4. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of bell-crank levers for lifting said body and pivoted thereto at the intersection of the two arms comprising the same, said pivot-points being to the rear of the longitudinal center of said body, one arm of each of said levers extending rearward of said pivot-point and adapted to have the lifting power applied thereto, the other arm extending forwardly and adapted to be variably connected to said body forward of the longitudinal center of the same, whereby said body, when lifted, will assume a predetermined but variable angle of inclination to the rear.

5. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of bell-crank levers for lifting said body and pivoted thereto at the intersection of the two arms comprising the same, said pivot-points being to the rear of the longitudinal center of said body, one arm of each of said levers extending rearward of said pivot-point and adapted to have the lifting power applied thereto while the other arm extends forwardly therefrom, and an arm or arms extending downwardly from said body in proximity to the free end of one or both of said forwardly-extending arms and adapted to be variably connected therewith, whereby said body, when lifted, will assume a predetermined but variable angle of inclination to the rear.

6. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of bell-crank levers pivoted to said body for lifting the same, means for causing said body to assume a predetermined angle to the rear when lifted, and levers pivoted to said frame to the rear and to said body at the pivot-points of said bell-crank levers for guiding said body with respect to said frame during its lifting and returning movement.

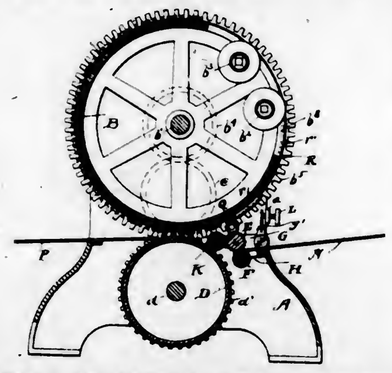
7. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of bell-crank levers pivoted to the body for lifting the same, each having a downwardly-extending arm to which the lifting power is applied, and an arm for each lever pivoted at one end to the frame and at its other end to the end of said bell-crank-lever arm for guiding the latter in its movement.

8. In a dumping-wagon, the combination with the frame, and

a pair of pivoted arms in which the ends of said feed-rollers are jour-

8. In a dumping-wagon, the combination with the frame, and the wagon-body, of a pair of bell-crank levers pivoted to the body for lifting the same, each having a downwardly and rearwardly extending arm to which the lifting power is applied, said arm being curved upwardly at its lower end, and a curved arm for each lever pivoted at one end to the frame and at its other end to the end of its said bell-crank-lever arm, whereby the latter is guided in its movement to the inactive position to a position wherein its lower curved end is substantially horizontal and raised from the ground.

812,735. **FEEDING MECHANISM FOR PRINTING-MACHINES.** HARRY C. GARNETSR, Cleveland, Ohio, assignor to The American Multigraph Company, Cleveland, Ohio, a Corporation of Ohio. Original application filed Mar. 7, 1903. Serial No. 146,051. Divided and this application filed Mar. 3, 1904. Serial No. 196,388.



Claim.—1. The combination of a printing-drum, an impression-platen therefor, a feed-initiating device adjustably mounted on the drum, feeding mechanism including a roller mounted on pivoted arms and adapted to be controlled by said device, and a spring constraining one of said arms, substantially as described.

2. The combination of a printing-drum, an impression-platen therefor, a segment carried by the drum, feeding mechanism including a roller mounted on pivoted arms, a spring constraining said arms, and a pinion carried by one of the arms and geared with said roller and adapted to be engaged by said segment, substantially as described.

3. The combination of a printing-drum, an impression-platen therefor, rollers for feeding paper between the printing-drum and platen, a band passing around the periphery of said drum, a member carried by said band for initiating the operation of the feed, and means for adjusting said band throughout a greater distance than the length of the member carried by it, whereby the time of beginning the feed may be regulated within a wide range.

4. In a printing-machine, the combination of a printing-drum, an impression-platen, feed-rollers adapted to convey paper thereto, arms carrying said feed-rollers, a spring tending to swing said arms to cause one of the feed-rollers to bear on the impression-platen, means for adjusting said spring, a gear connected with one of said rollers, and a rack adjustably carried by the printing-drum for engaging said gear, substantially as described.

5. In a printing-machine, the combination of a printing-drum, an impression-platen, a pair of arms pivoted to the frame of the machine, springs carried by said arms, screws carried by the frame and adjustably bearing against said springs, a roller carried by said arms and forced by said springs against the impression-platen, and other rollers carried by said arms for feeding the paper to the space between the roller first mentioned and the impression-platen, substantially as described.

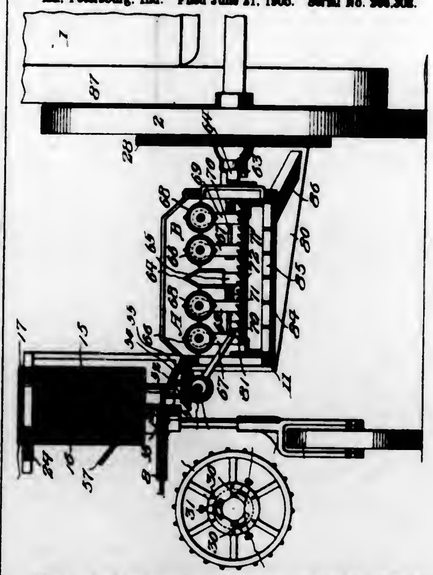
6. In a printing-machine, the combination of a printing-drum, an impression-platen, a feed-roller cooperating with the platen, a pair of arms carrying said feed-roller, another feed-roller journaled in said arms, a gear on said last-mentioned feed-roller, a rack on the printing-drum adapted to drive said gear, and the third feed-roller carried by said arms and spring-pressed toward the feed-roller which carries the gear, substantially as described.

7. In a printing-machine, the combination of a printing-drum, an impression-platen, a feed-roller adapted to bear upon said platen, a pair of pivoted arms in which the ends of said feed-rollers are journaled, a second feed-roller journaled in said arms, slotted extensions carried by said arms adjacent to the second feed-roller, a third feed-roller having gudgeons taking into such slots, springs bearing on said gudgeons to force the said third feed-roller toward the second feed-roller, and springs bearing on said arms to force the first feed-roller toward the platen, substantially as described.

8. In a printing-machine, the combination of a printing-drum, an impression-platen, a feed-roller adapted to bear upon said platen, a pair of arms in which the ends of said feed-roller are journaled, a second feed-roller journaled in said arms, slotted extensions carried by said arms adjacent to the second feed-roller, a third feed-roller taking into such slots, and a rack adjustably carried by the printing-drum and adapted to engage gearing connected with said second feed-roller, substantially as described.

9. In a printing-machine, the combination of a printing-drum, an impression-platen, a feed-roller cooperating with the impression-platen, a pair of feed-rollers in advance thereof, means for driving one of the feed-rollers of this pair, and a table adjacent to this pair and having the plane of its upper surface substantially passing between the rollers of this pair and striking the impression-platen adjacent to the roller first mentioned, substantially as described.

812,736. **CORN HARVESTER AND HUSKER.** THEODORE GLADDEN, Petersburg, Ind. Filed June 21, 1905. Serial No. 266,308.



Claim.—1. A combined corn harvester and husker comprising a frame, husking-rolls carried by the frame, snapping-rolls also carried by the frame and arranged at one side and above the plane of the husking-rolls, gathering mechanism including a gathering-chain provided with fingers for conducting the stalks to the snapping-rolls, means for operating the rolls and chain, and a delivery-board comprising stationary and yielding sections adapted to convey the ears of corn from the gathering-chain on which they fall from the snapping rolls to the husking-rolls, said yielding section being adapted to support the fingers of the chain, substantially as described.

2. A combined corn harvester and husker comprising a supporting-frame, husking-rolls carried by said frame, snapping-rolls also carried by the frame and arranged at one side and above the plane of the husking-rolls, gathering mechanism for conveying the stalks to the rolls including a chain provided with gathering-fingers, means for operating the rolls and chain, said fingers being adapted to receive the ears of corn separated from the stalks by the snapping-rolls, and a delivery-board for conveying the ears from the chain to the husking-rolls, said board comprising a stationary section and a spring-actuated yielding section adapted to support the chain-fingers adjacent to the snapping-rolls.

3. A combined corn harvester and husker comprising a supporting-frame, husking-rolls carried by said frame, snapping-rolls also carried by the frame and arranged at one side of and above the plane of the husking-rolls, gathering means including a gathering-chain provided with fingers for conveying the stalks to the snapping-rolls, means for operating the rolls and chain, the fingers of the chain being adapted to receive and support the ears of corn detached by the snapping-rolls, and a delivery device adapted to conduct the ears from the chain to the husking-rolls, said delivery device comprising a stationary section, and a movable section in sliding contact therewith, said movable section supporting the fingers of the chain adjacent to the snapping-rolls and having a depending portion, and spring-pressure means acting on said depending portion to maintain the movable section beneath the chain-fingers and to adapt the same to yield for the passage of stalks of different sizes.

4. A combined corn harvester and husker comprising a supporting-frame, husking-rolls horizontally mounted upon the frame, snapping-rolls vertically mounted upon the frame at one side of and above the plane of the husking-rolls, gathering mechanism including a gathering-chain provided with fingers for feeding the corn to the snapping-rolls, said chain being disposed below said rolls with its fingers arranged to catch and support the detached ears, means for operating the rolls and chain, a stationary fender arranged to conduct the ears to the fingers of the chain, and a delivery-board for conducting the ears from said fingers to the husking-rolls, said board having a yielding portion to support the fingers adjacent to the snapping-rolls.

5. A combined corn harvester and husker comprising a supporting-frame having a guide-passage, horizontal husking-rolls arranged upon one side of said passage, vertically-arranged snapping-rolls disposed in line with the passage above the plane of the husking-rolls, gathering mechanism including a gathering-chain provided with gathering-fingers for conducting the corn along said passage to the snapping-rolls, said chain having a working stretch movable along said passage, spring-bearings for movably mounting one of the snapping-rolls, a guiding element for the working stretch of the chain connected to and movable with the movable snapping-rolls and adapted to adjust the working stretch of the chain therewith, means for operating the rolls and chain, the fingers of the chain being arranged to receive the ears detached by the snapping-rolls, and a delivery device supporting said fingers adjacent to the snapping-rolls and adapted to convey the detached ears therefrom to the husking-rolls.

6. A combined corn harvester and husker comprising a supporting-frame having a guide-passage, horizontal husking-rolls arranged upon one side of said passage, vertically-arranged snapping-rolls disposed in line with the passage above the plane of the husking-rolls, gathering mechanism including a gathering-chain provided with gathering-fingers for conducting the corn along said passage to the snapping-rolls, said chain having a working stretch movable along said passage, spring-bearings for movably mounting one of the snapping-rolls, a guiding element for the working stretch of the chain connected to and movable with the movable snapping-roll and adapted to adjust the working stretch of the chain therewith, means for operating the rolls and chain, the fingers of the chain being adapted to catch and support the ears detached by the snapping-rolls, and a delivery-board for conveying the detached ears from the fingers to the husking-rolls, said board having a spring-pressed yielding section to support the fingers adjacent to the snapping-rolls and to regulate the width of the passage adjacent to the snapping-rolls.

7. In a combined corn harvester and husker, a guideway having a flaring entrance, snapping-rolls vertically arranged at the rear end of the guideway, one of said rolls being movably mounted in spring-bearings, a short gathering-chain disposed on one side of the flaring entrance of the guideway, a second gathering-chain having a working stretch extending along the other flaring side of the guideway and continuously along said guideway to the snapping-rolls and connected for operation with the movable snapping-roll, and means for operating said gathering-chains and snapping-rolls.

8. In a corn-harvester, a main frame, a guideway disposed at one side thereof, snapping-rolls arranged at the rear end of the guideway, gathering mechanism for feeding the stalks along the guideway to the snapping-rolls, said mechanism including a chain having a working stretch extending along the guideway and provided with gathering-fingers, said fingers being adapted to receive and support the ears detached by the snapping-rolls, and a delivery-board having a yielding section supporting the fingers and arranged to convey the detached ears therefrom to the main frame.

9. In a corn-harvester, a main frame, a guideway arranged at one side thereof, snapping-rolls arranged at the rear end of the guideway, one of said rolls being yieldably mounted, gathering mechanism including a gathering-chain having a working stretch movable along the guideway and provided with fingers, said chain being connected with and driven from the movable roll with its fingers arranged to catch and support ears detached by the rolls, a guiding element for said working stretch of the chain movable with the movable snapping-roll, and a delivery-board for conveying the detached ears from the chain to the main frame, said board having a yielding section disposed in the guideway and arranged to support the fingers adjacent to the snapping-roll.

10. In a combined corn harvesting and husking apparatus the combination with a wagon having a driving-wheel, of a frame arranged alongside said wheel and supporting gathering and husking mechanism, means for operating said husking and gathering mechanism from the driving-wheel, connections between said frame and the wagon-body, and a detachable connection between the frame and the cap-nut of the axle of the driving-wheel.

11. In a combined corn harvester and husker, the combination of a main frame, husking-rolls mounted therein, snapping-rolls mounted at one side of said main frame, gathering mechanism for conveying the corn to the snapping-rolls, said mechanism including a chain provided with fingers adapted to support the ears detached by the snapping-rolls, drive-gearing, a shaft extending beneath the snapping-rolls and operated by said gearing, said shaft being operatively connected with the rolls and gathering mechanism, a delivery device arranged to support the ear-holding fingers of the chain and convey the ears therefrom to the husking-rolls, a shaking-separator in the main frame below the husking-rolls, and means for operating said separator from the said shaft.

812,737. **GRINDING-MILL.** WILLARD HALSTEAD, Syracuse, N. Y., assignor to The Engelberg Huller Company, Syracuse, N. Y., a Corporation of West Virginia. Filed Feb. 1, 1905. Serial No. 243,647.

Claim.—A grinding-mill comprising a casing having a circular opening on one side, rotating grinding-heads within the casing, shafts extending into the casing to which the grinding-heads are secured, a feed-spout entering an opening in the side of the casing and having a semicircular discharge-mouth partially embracing the driving-shaft of one of the grinding-heads, a segmental plate attached to the side of the case and partially filling the opening therein and a flange on one of the grinding-heads extending through the annular opening in the casing and closely surrounding the mouth of the spout and the segmental plate.

812,738. **COTTON-CHOPPING MACHINE.** JAMES A. HARDEN, Andalusia, Ala. Filed Nov. 15, 1905. Serial No. 287,510.

Claim.—1. In a cotton-chopping machine, the combination of the beam, its supporting-wheel, a longitudinally-reciprocating bar arranged transversely of and projecting to one side of the beam, a

hoe attached to said bar, and means for actuating said bar by and from said wheel, substantially as described.

2. In a cotton-chopping machine, the combination of the beam, the supporting-wheel, a longitudinally-reciprocating bar arranged transversely of and projecting to one side of the beam, a hoe attached to the outer end of the bar, and a bell-crank lever and connecting-rod for actuating said bar from said wheel, substantially as described.

3. In a cotton-chopper, the combination of a wheel, a transversely-arranged longitudinally-reciprocating bar supported in rear of the wheel and projecting to one side of the beam, a bell-crank lever connected to said bar, and a rod connecting said lever with the wheel, a guide for said bar, and a hoe attached to the outer end of said bar, substantially as described.

4. In a cotton-chopper, the combination of a beam, a tracking-wheel, a longitudinally-reciprocating bar supported in rear of the wheel and lying transversely of the beam, a bell-crank lever connected to said bar, and a rod connected to said lever and having an adjustable connection to the wheel, a guide for said bar, and a hoe attached to the outer end of said bar, substantially as described.

5. In a cotton-chopper, the combination of the beam, a wheel attached to the forward part thereof, a transversely-arranged longitudinally-reciprocating hoe-carrying bar attached to the beam in rear of the wheel, a bell-crank lever pivoted to the beam and having one arm pivotally connected with said bar, a connecting-rod connected to the wheel and to the bell-crank lever, and a hoe removably attached to the outer end of said bar, substantiilly as described

6. In a cotton-chopper, the combination of the beam, a wheel on the forward part thereof, a transversely-arranged longitudinally-reciprocating bar attached to the beam in rear of the wheel, a guide for said bar, a bell-crank lever pivoted to the beam, and having one arm pivotally connected with said bar, a rod connected to an adjustable wrist-pin on the wheel, and pivotally connected to the bell-crank lever, and a hoe attached to the outer end of said bar, substantially as described.

7. In a cotton-chopper, the combination of a longitudinally-reciprocating hoe-bar, means for reciprocating the bar, and means for causing the rising and falling of the hoe as the bar reciprocates, substantially as described.

8. In a cotton-chopper, the combination of the beam, a reciprocating hoe-bar, a hoe thereon, means for reciprocating the bar longitudinally, and means for causing the rising and falling of the hoe end of bar as it reciprocates, substantially as described.

9. In a cotton-chopper, the combination of a wheel, a transversely-arranged hoe-bar, projecting to one side of the wheel and having a double-inclined bearing portion, a guide for the bar engaging said bearing portion, a hoe attached to the outer end of said bar, and means for actuating the bar from the wheel, substantially as described.

10. In a cotton-chopper, the combination of a beam, a wheel thereon, a reciprocating bar projecting to one side of the wheel and having a double-inclined bearing portion, a guide for the bar engaging said guide bearing portion whereby the bar is caused to rise and fall as it reciprocates, a hoe attached to the outer end of said bar, and a lever and connecting-rod for actuating the bar from the wheel, substantially as described.

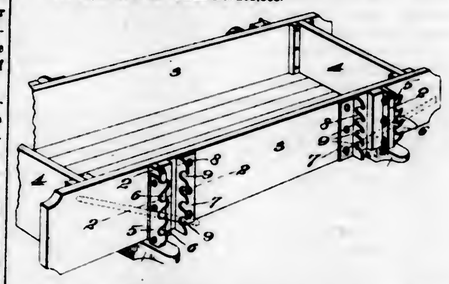
11. In a cotton-chopper, the combination of the beam, the wheel supporting the forward end thereof, a reciprocating bar arranged transversely of the beam and a guide for the beam, a hoe attached to the outer end of said beam; means for reciprocating said bar longitudinally, and means for causing a rising-and-falling movement of the hoe as it is reciprocated, substantially as described.

12. In a cotton-chopper, the combination of the beam, the handles at rear end thereof, the wheel supporting the forward end thereof, a reciprocating bar arranged transversely of the beam and projecting to one side thereof, a guide for the beam, a hoe detachably attached to the outer end of said beam, a bell-crank lever and connecting-rod for reciprocating said bar, and means for causing a rising-and-falling movement of the hoe as it is reciprocated, substantially as described.

13. In a cotton-chopper, the combination of the wheel, a transversely-arranged reciprocating bar in rear of the wheel projecting to one side, a guide for said bar, means to cause a rising-and-falling motion of the bar as it reciprocates, a bell-crank lever connected with said bar, a rod pivoted to said bell-crank lever and connected to the wheel, and spring-teeth in rear of the hoe, substantially as described.

14. In a cotton-chopper, the combination of the beam, a wheel supporting the forward end thereof, a transversely-arranged reciprocating bar in rear of the wheel projecting to one side of the beam, a guide for said bar; means to cause a rising-and-falling motion of the bar as it reciprocates, a bell-crank lever connected with said bar, a rod pivoted to said bell-crank lever and connected to an adjustable wrist-pin on the wheel, handles for the rear end of the beam, and spring-teeth attached to the beam in rear of the hoe, substantially as described.

812,739. **DUMPING-WAGON.** Martin Harles, St. Louis, Mo. Filed Sept. 18, 1905. Serial No. 278,868.



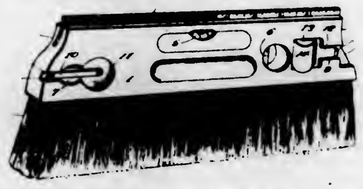
Claim.—1. The combination with a wagon, of notched plates secured to the bolster-standards, and notched plates secured to the side-boards; substantially as specified.

2. In a dumping-wagon, lever-engaging members secured to the bolster-standards, and lever-engaging members secured to the side-boards of the wagon; substantially as specified.

3. In a dumping-wagon, the combination with the bolster-standards, of notched plates secured thereto, and notched plates secured to the side-boards of the wagon; substantially as specified.

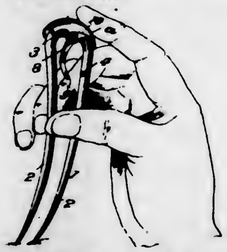
4. In a dumping-wagon, the combination with the usual bolster-standards and side-boards, of notched plates detachably secured to said standards, and notched plates detachably secured to the side-boards adjacent the standards; substantially as specified.

812,740. **HANDY DEVICE FOR PAPER-HANGERS.** Arthur C. Harris, Lagrande, and Edward C. Jarman, Haines, Oreg. Filed June 3, 1905. Serial No. 263,681.



Claim.—In a device of the class described, the combination of a handle, brush-bristles projected from the handle, a rule or measure at one edge of the handle, a roller carried by the handle, a cutter mounted on said handle, and levels arranged upon the handle.

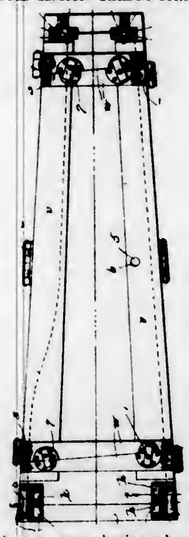
812,741. **HAIR-PIN.** James M. Hartley, Washington, D. C. Filed Oct. 27, 1905. Serial No. 284,657.



Claim.—1. In combination, a hair-pin having prongs and a connecting-bar, a seat formed on the inside of one of the prongs, a finger-piece straddling the connecting-bar and pivotally mounted thereon, a locking device depending from the finger-piece between the prongs, the end of the locking device engaging the seat, and a spring for holding the locking device in the seat.

2. In combination, a hair-pin having prongs and a cross-bar, a seat formed in one of the prongs, a pivoted locking device mounted on the cross-bar and extending between the prongs and twisted to make its lower end parallel with the prongs to engage the seat, and a spring to retain the lock in its seat.

812,742. **TROUSERS-PRESS.** Jeremiah L. Hattery, San Bernardino, Cal. Filed June 22, 1905. Serial No. 266,390.



Claim.—1. A trousers-press, having a base-board provided at one end with transverse presser-feet, at the other end with longitudinal spring-catches, and between the ends with pressure-bars having transverse interlocking levers, substantially as specified.

2. A trousers-press having a base-board and at each end thereof lateral presser-feet and between the ends longitudinal pressure-bars having interlocking levers, substantially as specified.

3. A trousers-press having a base-board, and at each end thereof lateral presser-feet, a flat pressure-spring at the middle of the front edge of said board, and between the ends longitudinal pressure-bars, and means for securing the latter in pressed-down position, substantially as specified.

4. In a trousers-press, the combination with a base-board, and its transverse under cleats, of the longitudinal pressure-bars, their interlocking levers, and the curved-end clamping-hinges, substantially as specified.

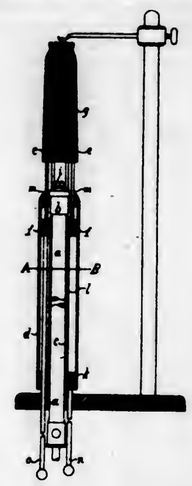
5. In a trousers-press, the combination with a base-board and the lateral pressure-feet at its ends, of longitudinal pressure-bars, their interlocking levers, and the clamping-hinges, substantially as specified.

6. A trousers-press having a base-board, screw-operated pressure-feet at one end thereof, spring-actuated pressure-foot at the other end thereof, between the ends longitudinal pressure-bars hinged to said base-board, the levers of said pressure-bars, and means for locking the same, substantially as specified.

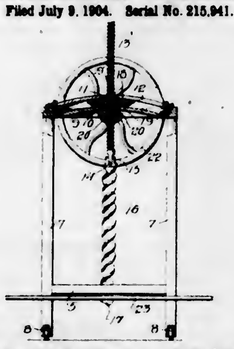
812,743. **APPARATUS FOR FIRING INCANDESCENT MANTLES.** Hugo Heidgen, Hamburg, Germany. Filed Sept. 20, 1904. Serial No. 224,869.

Claim.—Apparatus for firing incandescent mantles composed of a standard with a hook for suspending the mantles, of a burner centrally movable in a direction toward the suspension-hook, of a tube guiding said burner within and having a longitudinal guide-rib on the outer surface, of a ring *k* guided on said rib and carrying a smoothing-body adapted to be pushed into the mantle, of a second ring *f* guided on said rib, and of pins *c* secured in the ring *f*, the rings *k* and *f* being provided with means to move them axially and concentrically to the burner.

812,743.



812,744. **POST-HOLE AUGER.** Fred G. Hertig, New Philadelphia, Ohio. Filed July 9, 1904. Serial No. 215,941.



Claim.—An earth-auger comprising a frame including uprights and connecting cross-pieces, vertically-spaced upwardly-arched plates mounted in the upper portion of the frame, said plates having alining threaded perforations through their central portions, a screw fitted in said perforations and extending above and below the plates and having a longitudinal groove, a bevel-gear having a central perforation in which the screw is slidably received, said gear being rotatable between and in contact with the spaced plates and having a lug slidably engaging the groove of the screw, an auger connected to the lower end of the screw, a second bevel-gear meshing with the first-named bevel-gear, and means for rotating the second bevel-gear in either direction, whereby the screw and bit may be raised or lowered.

812,745. **CROSS-HEAD AND CROSS-HEAD GUIDE.** James E. Hooley, Littlefalls, N. Y. Filed Apr. 3, 1905. Serial No. 253,567.

Claim.—1. In a steam-engine, the combination with a reciprocatory cross-head, of a plurality of diamond-shaped guide-rods mounted in opposite pairs, upon which said cross-head is slidably mounted, the cross-head having openings conforming to the guide-rod for passage of said guide-rods.

2. In a steam-engine, the combination with a reciprocatory cross-head, of a plurality of diamond-shaped guide-rods mounted in opposite pairs and forming a diamond-shaped frame, said cross-head having arms slidably mounted upon said guide-rods.

3. In a steam-engine, the combination with a steam-cylinder, a piston-rod actuated by a piston within said cylinder and passing through both ends of the cylinder, a diamond-shaped guide-frame at either end of the cylinder, said frames comprising a supporting-plate connected to the cylinder-head by a plurality of diamond-shaped

---

bars oppositely disposed, a four-armed cross-head secured to either end of the piston-rod, and adapted to reciprocate upon the said bars.

---

and products of combustion, a plate within the upper of said ovens having its side edges spaced from the side walls thereof, means for introducing fresh air around said fire-pot to said heating-chamber for

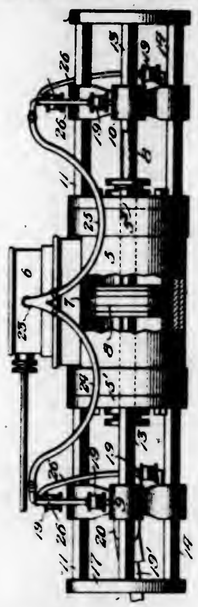
---

with the films of the two parts of the compound photograph separated by an effective distance; all substantially as described.

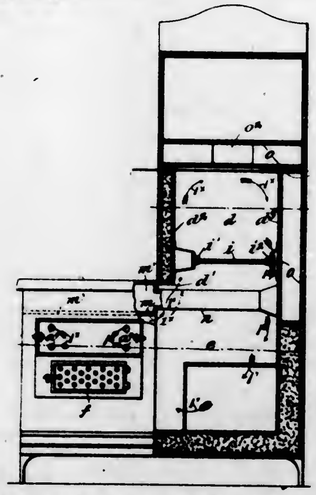
---

tool-supporting extension projecting rearwardly therefrom parallel with the handle and having a bore extending therethrough, a re-

bars oppositely disposed, a four-armed cross-head secured to either end of the piston-rod, and adapted to reciprocate upon the said bars.



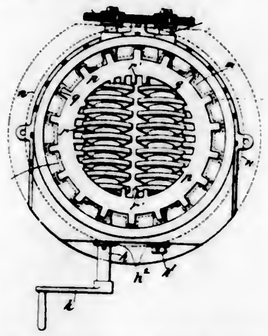
812,746. COOKING-RANGE. ARTHUR R. HUBBARD, Bermondsey, and ROBERT FLAY, county of Middlesex, England. Filed Nov. 23, 1905. Serial No. 288,747.



Claim.—1. A cooking-range provided with a fire-pot, a heating-chamber adjacent thereto, and a plurality of superposed ovens communicating with said heating-chamber, in combination with means for introducing fresh air around said fire-pot to said heating-chamber for highly heating said air and circulating same through said ovens, and means for conveying said air after its passage through said ovens to the interior of the fire-pot, substantially as described.

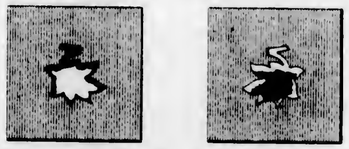
2. A cooking-range provided with a fire-pot, a heating-chamber adjacent thereto, and a pair of superposed ovens communicating with each other and with said heating-chamber, in combination with a flue, passing between said ovens for carrying off the heated gases and products of combustion, a plate within the upper of said ovens having its side edges spaced from the side walls thereof, means for introducing fresh air around said fire-pot to said heating-chamber for highly heating said air and causing it to circulate through said ovens, and means for conveying said air after circulation through said ovens to the interior of the fire-pot, substantially as described.

812,747. FIRE-POT AND GRATE THEREFOR. ARTHUR R. HUBBARD, Bermondsey, and ROBERT FLAY, county of Middlesex, England. Filed Dec. 7, 1905. Serial No. 290,769.



Claim.—The combination of a fire-pot provided with vertical grooves, a ring fitting the interior of said fire-pot and provided with outwardly-extending teeth guided by said grooves, and rotary grate-bars situated beneath said ring and provided with cams adapted to raise said ring when said bars are rotated, substantially as described.

812,748. PHOTOGRAPHY. JOHN W. IPPERS, New York, N. Y., assignor to Albert Henry Walker, trustee, New York, N. Y. Filed Sept. 9, 1905. Serial No. 277,659.



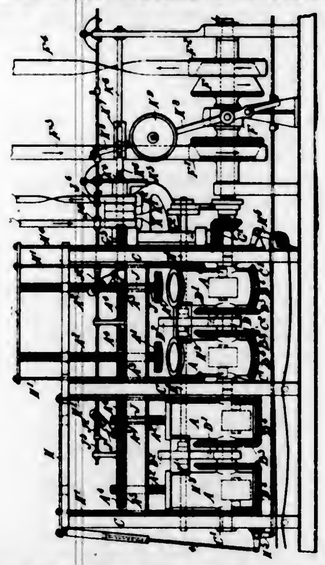
Claim.—1. The following process in photography: making a thin photograph, having a tinted area and a clear area: making a counterpart dense photograph, having a clear area and an opaque area: uniting those photographs into one structure, with their films separated by an effective distance, and with the clear area of its thin part, opposite to the opaque area of its dense part: placing and holding that compound photograph before a camera, with its thin side nearest the camera, and with its dense side exposed to moderate light, but shielded from direct sunlight and from excessive light: exposing a photographic plate in the camera, to subdued light coming from that compound photograph: developing that exposed plate into an intaglio photograph: and making a relief photograph from that developed intaglio photograph; all substantially as described.

2. The following process in photography: making a thin photograph, having a tinted area and a clear area: making a counterpart dense photograph, having a clear area and an opaque area: uniting those photographs into one structure, with their films separated by an effective distance, and with the clear area of its thin part opposite to the opaque area of its dense part: placing and holding that compound photograph before a camera, with its thin side nearest the camera, and with its dense side exposed to moderate light, but shielded from direct sunlight and from excessive light: exposing a photographic plate in the camera, to subdued light coming from that compound photograph; and developing that exposed plate into an intaglio photograph; all substantially as described.

3. A compound photograph: composed of a thin photograph having a tinted area and a clear area, and of a counterpart dense photograph, having a clear area and an opaque area; the two photographs being placed flatwise together, with the clear area of the thin photograph opposite to the opaque area of the dense photograph, and

with the films of the two parts of the compound photograph separated by an effective distance; all substantially as described.

812,749. COMMINUTING-MACHINE. ALBERT B. IVESON, Golborough, and ARCHIBALD R. WILSON, Brighton, England; said Wilson assignor to said Iveson. Filed Oct. 20, 1904. Serial No. 229,340.



Claim.—1. In a comminuting-machine, the combination of a series of compression-cylinders open at the top, a perforated bottom-plate on each of said cylinders, means for alternately and automatically tilting said cylinders at any desired angle, means for returning said cylinders to their upright position, a series of plungers adapted to fit into and be entirely withdrawn from the open end of their corresponding cylinders, and cutting means adapted to move in contact with the outside face of each of said perforated bottom-plates, substantially as shown and described.

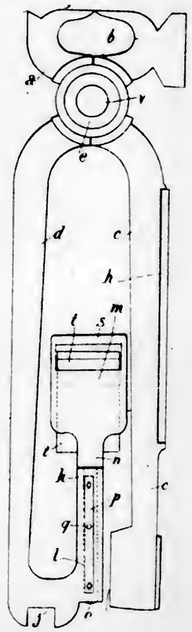
2. In a comminuting-machine, the combination of tilting compression-cylinders, plungers, means for tilting said cylinders, means for returning said cylinders to their upright position, screw-threaded piston-rods, internally-threaded sleeves in which said piston-rods work, auxiliary means for reversing the machine, a double-slotted link, an automatic clutch-lever working in said double-slotted link, a double-headed coned clutch on the main shaft, operated by said clutch-lever, oppositely-moving pulleys on said main shaft adapted to be engaged by said clutch-lever, and a series of gear-wheels connecting the reversing and operating parts of the mechanism, substantially as shown and described.

3. In a comminuting-machine, the combination of a series of compression-cylinders, open at the top, a perforated bottom-plate attached to each cylinder, plungers for corresponding cylinders, means for tilting and means for returning said cylinders to an upright position, rotary cutting means, gear-wheels, an automatic clutch-lever, a double-slotted link, a double-headed coned clutch, a main shaft and oppositely-moving pulleys on said main shaft, substantially as shown and described.

812,750. FARRIER'S TOOL. JOHANN KAS, Asch, Austria-Hungary. Filed June 21, 1904. Serial No. 213,581.

Claim.—1. A tool of the character described, comprising handles pivotally connected at one end, one of said handles being formed at its opposite end with an extension projecting inwardly between the handles and having a bore extending therethrough, a reversible implement provided with a stem adapted to be fitted into the bore from either end thereof, and means upon said extension for engaging the stem and securing the implement in either of its adjusted positions, substantially as described.

2. In a horseshoer's tool, a handle provided at one end with a tool-supporting extension projecting rearwardly therefrom parallel with the handle and having a bore extending therethrough, a reversible implement provided with a stem adapted to be fitted into the bore from either end thereof, and means upon said extension for engaging the stem and securing the implement in either of its adjusted positions, substantially as described.

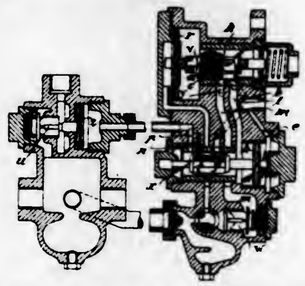


812,751. NON-REFILLABLE BOTTLE. WILLIAM B. KNOLLENBERG and JACOB A. FREY, St. Louis, Mo. Filed July 14, 1905. Serial No. 269,674.

Claim.—The combination with a bottle, provided with an interior shoulder at the point where the neck joins the body of the bottle, of a disk valve arranged to seat upon said shoulder, valve-stems integral with and projecting upwardly and downwardly from the center of the disk valve, and a solid cylinder of non-corrosive material seated in the neck of the bottle above the shoulder, which cylinder is provided in its under side with a recess to receive the upper valve-stem, there being a plurality of grooves formed in the surface of the cylinder, the central portions of which grooves are formed in oppositely-disposed U-shaped loops and which grooves extend to the

top and bottom of the cylinder, and the ends of said grooves being widened; substantially as specified.

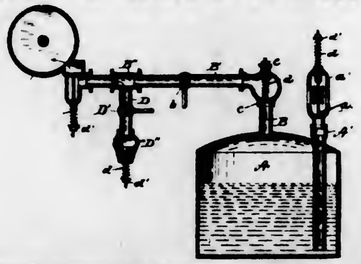
812,732. **DISTRIBUTING-VALVE FOR AIR-BRAKES.** GEORG KNORR, Britz, near Berlin, Germany. Filed July 11, 1904. Serial No. 216,171.



Claim.—1. In a device for simultaneously applying all the brakes of a train uniformly and with equal pressures in cases of emergency, the combination with the piston *k*, the cylinder of the same and the main distributing-valve, of means for connecting the front side of said piston with the compressed-air conduit, and a spring *i*, adapted to displace the piston until the pressure of the air at both sides of the piston is the same, an air-escape valve consisting of a forcing-valve *u*, and a spring pressing open said valve, a piston *z* connected with said valve and adapted to be displaced by the conduit-air in cases of emergency, substantially and for the purpose as described.

2. In a device for simultaneously applying all the brakes of a train in cases of emergency, the combination with the piston *k*, the cylinder of the same and the main distributing-valve, of means for connecting the front side of said piston with the compressed-air conduit, and a spring *i*, adapted to displace the piston until the pressure of the air at both sides of the piston is the same, an air-exit channel *p* terminating into the open air and an auxiliary slide *t* adapted to act upon said channel, substantially and for the purpose as described.

812,733. **CARBURETER FOR HYDROCARBON-ENGINES.** WESLEY KOUNS, Salina, Kans., assignor of one-half to Frederick H. Quincy, Salina, Kans. Filed Oct. 20, 1904. Serial No. 229,363.

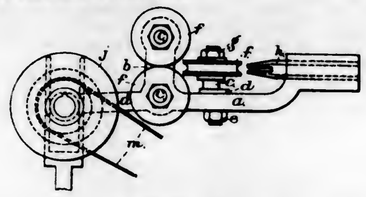


Claim.—In an autoregulated carbureter, the combination with the cylinder of an engine, and a supply-pipe B', provided with the globe-valve *b*, automatic check-valves *c c'*, and auxiliary air-pipe D, having automatic air-inlet valve D'', and globe-valve D', of a gasolene tank A, having outlet-pipe E, connecting with supply-pipe B', and being provided with air-inlet pipe A', the lower end of which extends nearly to the bottom of said tank and its upper end having attached thereto an air-valve *a* and its frame *a'*, substantially as described.

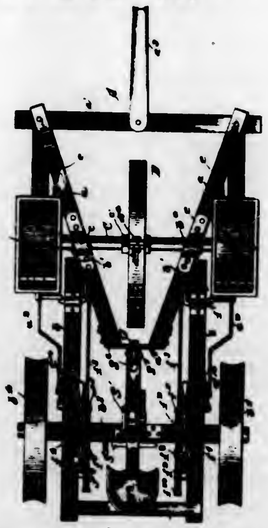
812,734. **WIRE-FINISHING TOOL.** EDWARD M. LANE, Jr., Portland, Me. Filed May 23, 1904. Serial No. 209,645.

Claim.—1. In a wire-finishing machine, the combination with a support, of a reducing-roll mounted thereon, a rotary adjustable shaft carried by said support, means for locking same in its adjusted position, a pintle eccentrically disposed on the end of said shaft beside said roll, and a second roll mounted on said pintle.

2. In a wire-finishing machine, the combination with a support, of a parallel pair of rotary adjustable shafts carried thereby with means for locking said shafts in a fixed position, eccentrically-disposed pintles on the ends of said shaft, and reducing-rolls on said pintles disposed in the same plane.



812,755. **CORN-PLANTER.** COLONEL W. LANHAM, Stanford, Ky. Filed Sept. 30, 1905. Serial No. 280,833.



Claim.—1. A corn-planter comprising a frame, composed of front and rear sections, the front section being substantially triangular in shape and comprising side bars and a cross-bar, the rear section being substantially rectangular in shape and comprising side bars hinged at their front ends to the side bars of the front section, a cross-bar connecting the rear ends of the side bars, an axle secured to the rear section intermediate the ends of the side bars, wheels on the axle, a shaft journaled on the side bars of the front section, a power-wheel secured to the shaft intermediate the side bars, and comprising a plurality of semicircular segments, outwardly-projecting lugs on the ends of the segments, bolts traversing openings in the lugs for securing the segments together, brackets on the front sections, hoppers supported by the brackets and having openings to receive the power-wheel shaft, dropping-wheels having spaced openings on their peripheral surface, corresponding to the position of the lugs on the power-wheel and secured to the ends of the power-wheel shaft within the hoppers, shoes arranged below the hoppers, means for raising and lowering the shoes, and means for raising and lowering the power-wheel with respect to the rear section.

2. A corn-planter comprising a frame, composed of front and rear sections, the front section being substantially triangular in shape, and comprising side bars and a cross-bar, the rear section being substantially rectangular in shape and comprising side bars hinged at their front ends to the side bars of the front section, a cross-bar connecting the rear ends of the side bars, an axle secured to the rear section intermediate the ends of the side bars, wheels on the axle, a shaft journaled on the side bars of the front section, a power-wheel secured to the shaft intermediate the side bars, and comprising a plurality of semicircular segments, outwardly-projecting lugs on the ends of the segments, bolts traversing openings in the lugs for securing the segments together, brackets on the front sections, hoppers supported by the brackets and having openings to receive the power-wheel shaft, dropping-wheels having spaced openings on their peripheral surface secured to the power-shaft within the hoppers, shoes supported below the hoppers, means for raising and lowering the shoes, and means for raising and lowering the power-shaft with respect to the rear section.

3. A corn-planter comprising a frame, composed of front and rear sections, the front section being substantially triangular in shape, and comprising side bars and a cross-bar, the rear section being substantially rectangular in shape and comprising side bars hinged at their front ends to the side bars of the front section, a cross-bar connecting the rear ends of the side bars, an axle secured to the rear section intermediate the ends of the side bars, wheels on the axle, a shaft journaled on the side bars of the front section, a power-wheel secured to the shaft intermediate the side bars, and comprising a plurality of semicircular segments, outwardly-projecting lugs on the ends of the segments, bolts traversing openings in the lugs for securing the segments together, brackets on the front sections, hoppers supported upon the front section, dropping-wheels having spaced openings on their peripheral surface secured to the power-shaft within the hoppers, shoes supported below the hoppers, means for raising and lowering the same, and means for raising and lowering the power-wheel with respect to the rear section.

4. A corn-planter comprising a frame composed of front and rear sections, the front section comprising side bars and a cross-bar, and the rear section being substantially rectangular in shape and comprising side bars hinged at their front ends to the side bars of the front section, a cross-bar connecting the rear ends of the side bars, wheels for supporting the rear section, a power-wheel journaled in the front section, and having oppositely-disposed lugs on the peripheral surface thereof, dropping-wheels having spaced openings on their peripheral surface corresponding to the position of the lugs on the power-wheel and connected directly therewith, hoppers inclosing the dropping-wheels, shoes supported below the hoppers, means for raising and lowering the shoes, and means for raising and lowering the power-wheel with respect to the rear section.

5. A corn-planter, comprising a frame composed of front and rear sections hinged together, wheels for supporting the rear section, a power-wheel journaled on the front section, oppositely-disposed lugs on the peripheral surface of the power-wheel, dropping-wheels having spaced openings on their peripheral surface corresponding to the position of the lugs on the power-wheel and directly connected therewith, hoppers inclosing the dropping-wheels, shoes supported below the hoppers, means for raising and lowering the shoes, and means for raising and lowering the power-wheel with respect to the rear section.

6. A corn-planter comprising a frame, composed of front and rear sections hinged together, wheels for supporting the rear section, a shaft journaled on the side bars of the front section, a power-wheel secured to the shaft intermediate the side bars and comprising a plurality of semicircular segments, outwardly-projecting lugs on the ends of the segments, bolts traversing openings in the lugs for securing the segments together, dropping-wheels having spaced openings on their peripheral surface corresponding to the position of the lugs on the power-wheel and secured to the ends of the power-shaft, hoppers inclosing the dropping-wheels, shoes supported below the hoppers, means for raising and lowering the shoes, and means for raising and lowering the power-wheel with respect to the rear section.

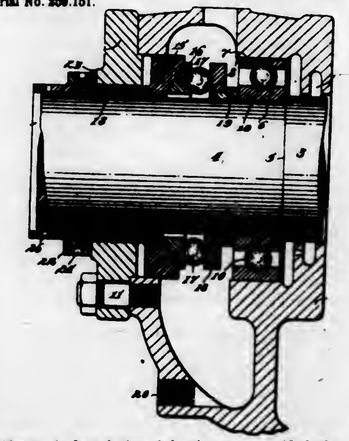
7. A corn-planter comprising a frame composed of front and rear sections hinged together, wheels for supporting the rear section, a power-wheel journaled in the front section, oppositely-disposed lugs on the peripheral surface of the power-wheel, brackets on the front section, hoppers supported by the brackets, dropping-wheels having spaced openings on their peripheral surface corresponding to the position of the lugs on the power-wheel and directly connected thereto, arranged within the hopper, shoes supported below the hoppers, means for raising and lowering the shoes and means for raising and lowering the power-wheel with respect to the rear section.

8. A corn-planter comprising a frame composed of front and rear sections, means for supporting the rear section, means for tilting the front section with respect to the rear section, a shaft on the front section, a power-wheel on the shaft, dropping-wheels on the shaft on either side of the power-wheel, hoppers inclosing the dropping-wheels, shoes supported below the hoppers, and means on the rear section for adjusting the shoes.

9. A corn-planter, comprising a frame, composed of hinged front and rear sections, means for supporting the rear section, means for tilting the front section with respect to the rear section, a power-wheel journaled in the front section, dropping-wheels connected directly with the power-wheel, hoppers inclosing the power-wheel, and shoes below the hoppers, and means on the rear section whereby to adjust the shoes

10. A corn-planter comprising a frame, means for supporting one end of the frame, a power-wheel for supporting the opposite end of the frame, dropping-wheels connected directly with the power-wheel, shoes below the dropping-wheels, and means whereby to adjust the shoes to and from the dropping-wheels.

812,756. **BEARING.** EDWARD S. LEA and JULIUS DEGEN, Trenton, N. J., assignors, by mesne assignments, to Lea-Degen Pump Company, Trenton, N. J., a Corporation of New Jersey. Filed May 6, 1905. Serial No. 259,151.



Claim.—1. In a device of the character specified, the combination with a frame, of an abutment on a shaft moving in said frame, a ball-bearing race adapted to bear against said abutment, another ball-bearing race corresponding to the first-mentioned race, balls running therein a member abutting one of the first-named races, a race carried thereby, a race corresponding thereto, balls running therein, means to shift the ball-races laterally, and thereby the shaft, and means to hold the shifting means in fixed position.

2. In a device of the character specified, the combination with a frame, of a sleeve fixed to a shaft moving axially in said frame, a ball-bearing race adapted to bear against said sleeve, another ball-bearing race corresponding to the first-mentioned race, balls running therein, a member abutting one of the first-named races, a race carried thereby, a race corresponding thereto, balls running therein, a screw-threaded collar secured to said frame, means to shift the second ball-bearing race relatively to the frame and movable in said collar, and means to maintain a fixed position, at will, of the parts.

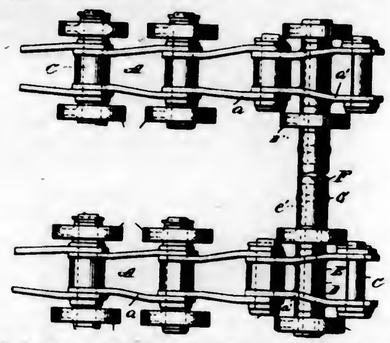
3. In a device of the character specified, the combination with a frame, of a shaft movable therein in two opposite directions, a collar fixed on said shaft, ball-races, one of which impinges said collar, balls in said race, an additional ball-race adapted to impinge the first races, a race corresponding with it, balls running therein, a sleeve surrounding the shaft and adapted for lateral impingement against one of the races, said sleeve having screw-threads on the outer side thereof, a collar internally screw-threaded, and carried by the frame, and in which the sleeve moves axially, a jam-nut carried by the sleeve, and lubricating means in said frame.

812,757. **CONVEYER.** CHRISTOPHER W. LEVALLEY, Milwaukee, Wis. Filed Apr. 12, 1905. Serial No. 255,117.

Claim.—1. In a conveyer, the combination of two parallel lines of chains, certain of the links whereof are provided with bearings extending across the links from side bar to side bar and arranged intermediate the joints of articulation of those links, pins mounted in the said bearings and projecting inward from the sides of the chains, and separable connecting-rods between the chains secured at their ends to the said inward-projecting pins, substantially as set forth.

2. In a conveyer, the combination of a pair of parallel chains, pins mounted in the side bars of certain of the links of the chains and disposed intermediate the joints of articulation of those links and

having their free ends extending inward beyond the sides of the chains, supporting-rollers mounted upon the said pins, and separable connecting-bars between the chains secured at their ends to the said pins, substantially as set forth.

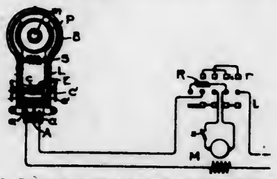


3. In a conveyer, the combination of two parallel lines of chains, certain of the links of which chains are provided with bearings D, disposed intermediate the joints of articulation of those links, pins E mounted in the said bearings, wheels B', B', mounted upon the said pins E, the inner ends of the pins extending beyond the inner wheels B', and the hollow connecting shafts or rods F arranged between the lines of chains and fitting over the projecting ends of the pins E, and means for uniting the shafts with the ends of the pins, substantially as set forth.

4. In a chain conveyer, the combination of a chain having supporting wheels or rollers, the wheels being arranged in pairs on a common axis coincident with the axis at a joint connection of the links and upon opposite sides of the chain, pins mounted in certain of the links at points intermediate the joint connections of such links with other links of the chain, the ends of such pins extending beyond the side bars of the links, separable bars arranged to support material to be transported secured to the projecting ends of the said pins and supporting wheels or rollers mounted upon the said projecting pins between the side bars of the links and the ends of the separable bars that are secured to the pins, substantially as set forth.

5. In a chain conveyer, the combination of a chain comprising articulated links, supporting-rollers for the chain mounted in pairs on the axes of the joints of the connected links and disposed on the opposite sides of the chain, pins mounted in certain of the links at points intermediate the joint connections of such links with other links of the chain, supporting-rollers mounted upon the said pins, the ends of the pins projecting beyond the said rollers, and separable bars secured to the projecting ends of the said pins and arranged to support the material to be transported by the conveyer, substantially as set forth.

812,758. **BRAKE.** SAM H. LIBBY, East Orange, N. J., assignor to Sprague Electric Company, a Corporation of New Jersey. Filed Sept. 16, 1904. Serial No. 224,044.



Claim.—1. In a motor-operated hoist, a manually-operated motor-controller, a magnet-winding in the motor-circuit, a member controlled by said magnet-winding, a brake, and operative connections from said brake both to said controller and to said member adapted to release said brake only upon the simultaneous movement of said controller to a running position and the energizing of said winding.

2. In a motor-operated hoist, a motor-controller, a brake, and means for releasing the brake comprising a cam operated by the controller, and an electromagnet in circuit with the motor.

3. In a motor-operated hoist, a motor-controller, a magnet-winding in the motor-circuit, a brake, a member pivotally supported on said brake, means operatively connected to said controller arranged to exert a pressure at one point on said member when said controller is moved to a running position, and means controlled by said magnet-winding for exerting a pressure at another point on said member.

4. In a motor-operated hoist, a motor-controller, a magnet-winding in the motor-circuit, a brake, a lever adapted by its movement to release said brake, means operatively connected to said controller arranged to exert a pressure at one point on said lever when said controller is moved to a running position, and means controlled by said magnet-winding for exerting a pressure at another point on said lever.

5. In a motor-operated hoist, a brake-wheel, two pivoted brake-arms, a spring normally pressing said arms toward each other and into engagement with said brake-wheel, two levers pivoted at one of their ends near the extremities of said brake-arms, a motor-controller, a cam on the controller-shaft, adapted to engage said levers intermediate their ends and to press said levers apart when said controller is moved to a running position, and a magnet-winding connected in the motor-circuit and adapted to draw the loose ends of said levers together.

6. In a motor-operated hoist, a motor-controller, a brake, a lever adapted by its movement to release said brake, means operatively connected to said controller for exerting a pressure on said lever when said controller is moved to a running position, and a magnet-winding connected in the motor-circuit and controlling the fulcrum of said lever.

812,759. **WHEEL-TIRE.** WILLIAM A. LOUDON, Chicago, Ill. Filed May 1, 1903. Renewed Jan. 16, 1905. Serial No. 241,368.

Claim.—1. In a wheel-tire the combination of a metallic band; a plurality of circumferential rows of wooden blocks and means for securing said blocks in position, said means comprising side flanges and clamps capable of radial adjustment between said rows of blocks.

2. In a wheel-tire the combination of a plurality of circumferential rows of wooden blocks; a clamping-ring on one side of said rows, segmental clamping-plates on the opposite side of said rows, circumferential clamping-rings between said rows, and screw-bolts connecting said clamping-rings and clamping-plates.

3. In a wheel-tire the combination of a plurality of circumferential rows of wooden blocks; a clamping-ring integral with a metallic band; segmental clamping-plates provided with a recess to receive the edge of said band; clamping-rings provided with lateral-extending circumferential flanges, between the said rows; and clamping-bolts substantially as specified.

4. In a wheel-tire the combination of a band, a plurality of circumferential rows of blocks and means for securing said blocks in position, said means comprising side flanges and clamps capable of lateral adjustment between said blocks.

5. In a wheel-tire the combination of a plurality of circumferential rows of blocks, a clamping-ring on one side of said rows, a clamping-ring on the other side of said rows, clamping means between said rows, and screw-bolts connecting said two clamping-rings.

6. In a wheel-tire the combination of a plurality of circumferential rows of blocks, a clamping-ring integral with a band on one side of said blocks, a clamping-ring on the other side of said blocks, clamping-plates between said rows of blocks and clamping-bolts connecting said two clamping-rings.

7. A wheel-tire comprising a plurality of circumferential rows of blocks resting on a circumferential band and circumferential plate capable of lateral adjustment on said band between said rows of blocks and means for securing said blocks, band and plates together.

8. A wheel-tire comprising a plurality of circumferential rows of blocks resting against a band, a plurality of fastening-pieces capable of lateral adjustment to said band located between said rows of blocks for securing said blocks in position and means for clamping said blocks to said band.

9. If a wheel-tire a plurality of circumferential rows of blocks resting on a band and annular bands capable of lateral adjustment on said band between said rows of blocks and means for clamping said rows of blocks together laterally.

10. In a wheel-tire, a plurality of circumferential rows of blocks resting against a band, a plurality of fastening-pieces capable of lateral adjustment to said band located between said rows of blocks, and means for clamping said rows of blocks together laterally.

11. In a wheel-tire the combination of a band, a plurality of circumferential rows of blocks and means for securing said blocks in position on said band, said means comprising side flanges, metallic pieces secured against radial displacement between said blocks and clamping-bolts.

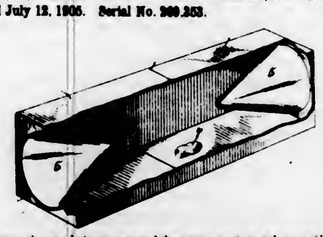
12. In a wheel-tire the combination of a plurality of circumferential rows of blocks, clamping-rings on either side of said rows, washers provided with lateral extensions between said rows and screw-bolts connecting said two clamping-rings.

812,760. **ELECTRICAL ROSETTE.** JAMES A. MEBANE, South Boston, Va. Filed Apr. 30, 1904. Serial No. 206,730.

Claim.—1. In an electrical rosette, the combination, with the cap, and a metal wire connection formed of spring sheet metal and having its end portions constructed in S shape and provided with notches, of wires which pass up through the cap proper and between the convolutions of the said connections and through the notches of the same, whereby they are duly held, substantially as described.

2. The rosette-cap provided with a recess and a wire connection whose body portion is secured in said recess and whose end portions are folded or bent upon each other in S shape and constructed with notches as and for the purpose specified.

812,761. **ROACH-TRAP.** JULIUS W. MEIER, New York, N. Y. Filed July 12, 1905. Serial No. 269,253.



Claim.—A roach-trap comprising two rectangular sections, one of said sections being cut away interiorly and the other of said sections being cut away exteriorly to form a flush overlapping joint, each of said sections having a closed end formed with a circular opening, and a funnel-shaped entrance-chute fitted into said opening.

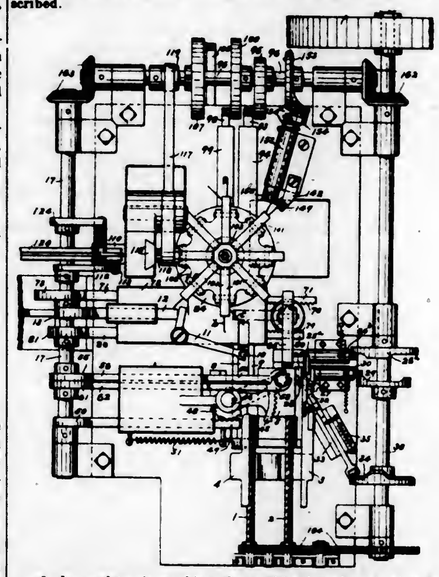
812,762. **MACHINE FOR MAKING SAFETY-PINS.** WILLIAM D. MIDDLEBROOK, Waterbury, Conn., assignor to Oakville Company, Waterbury, Conn., a Corporation of Connecticut. Filed Mar. 25, 1905. Serial No. 251,073.

Claim.—1. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of a safety-pin, mechanism for securing a cap or guard to one end of said wire, and means for closing the pin, substantially as described.

2. In a safety-pin machine the combination of mechanism for securing a cap or guard to one leg of a safety-pin, mechanism for feeding caps or guards to said capping mechanism, and means for closing the pin, substantially as described.

3. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of a safety-pin, mechanism for securing a cap or guard to one of said legs, and means for transferring the bent wire from the bending mechanism to the capping mechanism, substantially as described.

4. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of the pin, mechanism for securing a cap or guard to one leg of the pin, a holder for presenting the bent wire to the capping mechanism, and a conveyer for transferring the bent wire from the bending devices to the holder, substantially as described.



5. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of the pin, mechanism for securing a cap or guard to one leg of the pin, a holder for presenting the bent wire to the capping mechanism, a conveyer for transferring the bent wire from the bending mechanism to the holder, and means for closing the pin, substantially as described.

6. In a safety-pin machine, the combination of a mechanism for securing a cap or guard to one of the legs of a safety-pin, a holder for presenting the bent wire to the capping mechanism, and means for closing the pin, substantially as described.

7. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of a safety-pin, a holder, means for transferring the bent wire to the holder, a reciprocating die for carrying the cap over the end of the wire, and a coöperating die for bending the cap about the wire, substantially as described.

8. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of a safety-pin, mechanism for securing a cap or guard to one of said legs, a stationary holder for presenting a bent wire to the capping mechanism, and an oscillating carrier for transferring the bent wire to the holder, substantially as described.

9. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of a safety-pin, mechanism for securing a cap or guard to one of said legs, a stationary holder for presenting the bent wire to the capping mechanism, an oscillating carrier for transferring the bent wire to the holder, and means for closing the pin, substantially as described.

10. In a safety-pin machine, the combination of mechanism for bending the wire to form the legs of a safety-pin, mechanism for securing a cap or guard to one of said legs, and mechanism for arranging the caps in the same relative relation and feeding them to the capping mechanism, substantially as described.

11. In a safety-pin machine, the combination of mechanism for bending a wire to form the legs of a safety-pin, mechanism for securing a cap or guard to one of said legs, mechanism for arranging the caps in the same relative relation, and feeding said caps to the capping mechanism, and means for closing the pin, substantially as described.

12. The combination with mechanism for securing a cap or guard to a wire, of means for arranging the caps in the same relative relation, and means for feeding said caps to the capping mechanism, substantially as described.

13. The combination with a male die, of a female die, a magazine for supplying caps to said female die, means for moving the female die from the magazine to the male die, and means for feeding

the caps from the magazine to the female die, substantially as described

---

812,764. **METHOD OF TREATING FLOUR.** JOHN B. MUSSEL

6. Apparatus for sterilizing liquids under pressure, comprising

with hole-forming pins operative in connection with said mold-bod

the caps from the magazine to the female die, substantially as described.

14. The combination of means for holding a safety-pin, a pivoted closer for engaging the pointed leg of the pin, and carrying the point into the guard or catch, substantially as described.

15. The combination of means for holding a safety-pin, a shoulder for engaging the back of the pin, and means for engaging the pointed leg of the pin and carrying the point into the guard or catch, substantially as described.

16. The combination of a plate onto which the wire is delivered, reciprocating fingers for moving said wire over said plate, mechanism for bending said wire to form the legs of a safety-pin, a pivoted guide at one side of said plate, a bender-slide for bending the end of one of said legs, and a cam on said slide for lifting said guide, substantially as described.

17. The combination of a plate onto which the wire is delivered, reciprocating fingers for moving said wire over said plate, a vertically-reciprocating block, a clamping-jaw coöperating with the edge of said block, to clamp the end of the wire and a bender for bending the end of the wire, substantially as described.

18. The combination of a plane traveling surface for freely supporting the articles to be acted upon, a guide arranged at an inclination to the direction of travel of the supporting-surface and extending to within a distance from the edge of the supporting-surface less than the width of the articles, substantially as described.

19. The combination of a plane traveling surface for freely supporting the articles, a stationary guide arranged at an inclination to the direction of travel of the supporting-surface, and extending to within a distance of the edge of the supporting-surface less than the width of the articles and stationary guides beyond the end of said former guide, substantially as described.

20. The combination of a traveling surface for supporting the articles to be acted upon, a guide arranged at an inclination to the direction of travel of said surface, and extending to within a distance from the edge of said surface less than the width of the articles, and one or more notches in said guide, substantially as described.

21. The combination of a rotary disk having a plane upper surface, a guide extending toward the edge of said disk, and to within a distance from the edge of said disk less than the width of the articles to be acted upon, substantially as described.

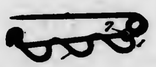
22. The combination of a rotary disk, a guide extending toward the edge of said disk, and to within a distance from the edge of said disk less than the width of the article to be acted upon, and one or more notches in said guide, substantially as described.

23. The combination of a rotary disk, a guide extending toward the edge of said disk and to within a distance from the edge of said disk less than the width of the articles to be acted upon, a second guide beyond said former guide extending toward the center of said disk, and a third guide extending to the edge of said disk, substantially as described.

24. The combination of a rotary disk, a guide extending toward the edge of said disk, and to within a distance from the edge of said disk less the width of the articles to be acted upon, a second guide extending toward the center of said disk, a third guide extending to the edge of said disk, and a chute into which the articles are directed by said third guide, substantially as described.

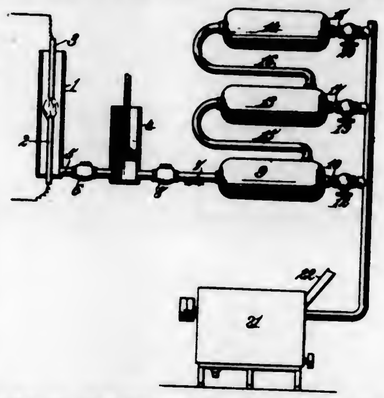
25. The combination of a plane traveling surface, for freely supporting the articles to be acted upon, a guide arranged at an inclination to the direction of travel of said surface, and extending to within a distance from the edge of said surface less than the width of said articles, a chute for delivering the articles upon said surface in front of said guide, and means for agitating said chute, substantially as described.

812,763. PENCIL AND PEN HOLDER. LORENZO MILLIRON, Pinedrove, S. D. Filed Apr. 8, 1905. Serial No. 254,542.



Claim.—A pencil and pen holding device comprising a shank having one end portion thereof bent to form a catch, the portion of the shank formed into the catch being refolded and thence extended longitudinally of the shank and formed into a plurality of article-holding loops at one side of the shank, the terminal of the bent end portion of the shank remote from the catch being bent into an eye receiving the shank at the end remote from that provided with said catch, and a pin for attaching the shank to the garment.

812,764. METHOD OF TREATING FLOUR. JOHN B. MITCHELL, St. Louis, Mo., assignor to Alsop Process Company, St. Louis, Mo., a Corporation of Missouri. Filed Sept. 24, 1904. Serial No. 226,849.



Claim.—1. The method of treating flour, which consists in subjecting air to the action of the flaming electric discharge, retarding the passage of the modified air to the flour for an appreciable length of time, and then conducting the modified air into the presence of the flour.

2. The method of treating flour, which consists in subjecting air to the action of the flaming electric discharge, storing the modified air for an appreciable length of time, and then conducting the same into the presence of the flour.

3. The method of treating flour, which consists in subjecting air to the action of the flaming electric discharge, passing the air as thus modified into an inclosed space and delaying its passage therethrough until the desired cooling and interdiffusion of the constituent gases have occurred, and finally subjecting to its action the flour to be treated.

4. The process of treating flour, which consists in producing a gaseous mixture containing oxids of nitrogen, delaying the passage of said gaseous mixture to the flour for an appreciable length of time, and then subjecting the flour to the action of the resultant gas or gases.

5. The process of treating flour, which consists in producing synthetically gaseous oxids of nitrogen, delaying the passage of the gaseous medium to the flour for an appreciable length of time and then subjecting the flour to the action thereof.

812,765. APPARATUS FOR STERILIZING LIQUID BY HEAT UNDER PRESSURE. CHARLES F. V. MOREL, Paris, France. Filed May 9, 1904. Serial No. 207,187.

Claim.—1. Apparatus for sterilizing liquids under heat, comprising an envelop, an ascending pipe therein, a boiler at the bottom of said envelop, and a pulsating device communicating with said ascending pipe for regulating the discharge of the sterilized liquid.

2. Apparatus for sterilizing liquids under heat, comprising an envelop having a trough, an ascending pipe in said envelop, and a boiler at the bottom of said envelop, the ascending pipe having baffles descending into the trough in the envelop to form a seal for the steam.

3. Apparatus for sterilizing liquids under pressure by heat, comprising an envelop, means to introduce the liquid to be sterilized, a boiler at the bottom part of the envelop, a bell having several vertical concentric baffles, corresponding compartments on the bottom of said boiler to receive said baffles, an ascending tube communicating with the center of said bell, and an outlet-valve for the sterilized liquid.

4. Apparatus for sterilizing liquids under heat, comprising an envelop, an ascending pipe, a boiler with a passage connecting said envelop and the ascending pipe, in combination with wings on the outside of the ascending pipe for retarding the descending liquid.

5. Apparatus for sterilizing liquids under heat, comprising an envelop, an ascending pipe, a boiler and a passage connecting said envelop and ascending pipe in said boiler, in combination with an outlet-chamber having a valve-seat and an elastic chamber carrying a valve adapted to seat therein, said elastic chamber being in the upper part of the ascending pipe.

6. Apparatus for sterilizing liquids under pressure, comprising an envelop, a boiler therein, an ascending pipe therefrom, means for directing steam from the boiler to the pipe, means for obstructing the circulation within the envelop, a passage of enlarged area above the ascending pipe and a valve to its outlet adapted to be operated by pressure within the pipe.

7. Apparatus for sterilizing liquids under pressure, comprising an envelop, a boiler, and a trough above the bottom of the boiler, an ascending pipe having depending plates in said trough, wings on the outside of the pipe, an enlarged passage for the liquid above the pipe, and a valve controlled by pressure within the boxes to the outlet therefrom.

812,766. COMBINED HAIR-BRUSH AND COMB. ALPINE MCKINNEY, Evangeline, La. Filed Sept. 2, 1905. Serial No. 276,866.

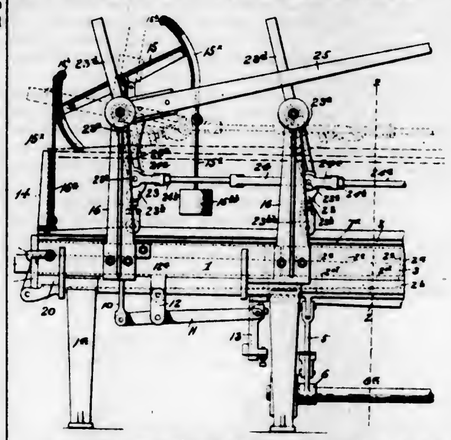
Claim.—A device of the character set forth, comprising a brush having the head thereof provided with a horizontally-extending recess, the entrance of said recess being located in one of the side edges of the head of the brush and reduced to provide shoulders, a comb mounted within the recess and having the back portion thereof provided with lateral offsets, a leaf-spring secured to the rear wall of the recess and having its free ends engaging the longitudinal edge of the back of the comb, said spring serving to automatically project and retain the comb projected laterally from the head of the brush, and means mounted within the recess and adapted to engage the comb to retain the same drawn within the recess.

812,767. MACHINE FOR MOLDING CEMENT FENCE-POSTS. BENNETT H. MCMILLAN, WILLIAM C. JOHNSON, and FRANK M. COLLORD, Danville, Ill. Filed Mar. 28, 1905. Serial No. 251,475.

Claim.—1. A machine of the character described, employing a mold-bed, a compression member coactive therewith, a core member arranged in said mold-bed; a hole-forming pin effective to sustain said core member within said mold-bed and means equipped with said pin.

2. A machine of the character described, employing a mold-bed, a compression member coactive therewith, a core member arranged within said mold-bed a follower bearing a hole-forming pin effective to sustain said core member centrally in position, and means for actuating said follower.

3. A machine of the character described, employing a mold-bed, a core member, a follower arranged below the latter and provided with hole-forming pins operative in connection with said mold-bed and effective to sustain said core member centrally and out of contact with said mold-bed, and means for actuating said follower.



4. A machine of the character described, employing a mold-bed, a compression member coactive therewith, and means for suspending said member in position comprising counterbalanced quadrant-levers, and connections between said levers and member.

5. A machine of the character described, employing a mold-bed, a compression member coactive therewith, means for suspending said compression member comprising counterbalanced quadrant-levers, and means for applying pressure to said member comprising toggle-lever mechanism connected up with said member.

6. A machine of the character described, employing a mold-bed, a compression member coactive therewith, means for suspending in position said member comprising counterbalanced quadrant-levers and connections between said member and said levers, and toggle-lever mechanism for applying pressure to said member.

7. A machine of the character described, employing a mold-bed, a compression member coactive therewith, quadrant-lever mechanism, a connection between said member and levers, and toggle-lever mechanism connected up with said member, and means for actuating said toggle-lever mechanism.

8. A machine of the character described, comprising a mold-bed, a compression or mold member coactive therewith, means for applying pressure to said mold member, lateral mold members coactive with both said mold-bed and compression member, a core for said mold-bed, and a follower equipped with a hole-forming pin effective to sustain said core member in position in said mold-bed and means for actuating said lateral mold members.

9. A machine of the character described, employing a mold-bed, a compression or mold member coactive with said mold-bed, and means for suspending in position said compression member, lever mechanism consisting of a centrally-pivoted lever provided with quadrants at its ends, connection being effected between one quadrant and said compression member, and a counterbalance suspended from the other of said quadrants.

10. A machine of the character described, employing a mold-bed, a core for said mold-bed, a follower equipped with hole-forming pins working in said mold-bed, and having shoulders thereon for supporting said core, or mandrel centrally within said mold-bed, and means for actuating said follower.

11. A machine of the character described, employing a mold bed or body, a core member arranged within the latter, a follower arranged in said mold-bed and equipped with pins effective to support said core member centrally within and out of contact with said mold-bed, counterbalanced foot-levers fulcrumed upon a pivot-rod, and links connected to said foot-levers and said follower.

12. A machine of the character described, employing a semicylindric mold bed or body, an arcuate compression or mold member, guides secured upon said body for said member and lateral mold members fitting upon said mold-bed and having lateral extensions overlying lateral upstanding extensions of said mold-bed, and means for imparting movement to said compression member.

13. A machine of the character described, employing a mold bed or body, and lateral mold members having outward-extending

lateral flanges overhanging lateral upstanding extensions of said bed or body.

14. A machine of the character described, employing a mold bed or body, lateral mold members having outward-extended lateral flanges, and a compression or mold member having its outer lateral portions equipped with stop-nuts adapted to engage said lateral flanges to limit or control the movement of said compression member in one direction.

15. A machine of the character described, employing a mold bed or body, an auxiliary bottom member therefor, an end movable member coactive with said mold-bed and adapted to aid the production of the post formation, lateral mold members resting upon the upper lateral edges of said auxiliary bottom, and a compression member superposing said lateral mold members.

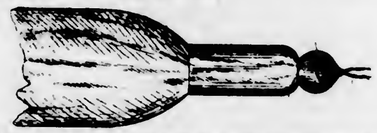
16. A machine of the character described, employing a mold bed or body, a core or mandrel member, means sustaining the latter centrally within the former, comprising a follower having upward-extending pins provided with shoulders upon which rests said core or mandrel, and a collar suitably held in one end of said mold-bed and slipped upon that end of said core or mandrel.

812,768. **MEDICATED TAMPON.** EDMUND M. POND, Rutland, Vt. Filed July 24, 1903. Renewed May 26, 1905. Serial No. 262,461.

Claim.—1. A medicated tampon consisting of a soluble gelatinous capsule having an open inner end, an expansible absorbent material compressed within the capsule, and a medicated soluble gelatinous plug seated in and extending from the open end of the capsule.

2. A medicated tampon consisting of a soluble gelatinous capsule having an open inner end and the other end perforated to permit the passage of a cord, an expansible absorbent filling compressed within the capsule, a cord connected to the filling and extending out through the aperture in the capsule, and a medicated soluble conical plug having its base seated in the open end of the capsule and its body projecting therefrom.

812,769. **MEDICATED TAMPON.** EDMUND M. POND, Rutland, Vt. Filed July 19, 1904. Serial No. 217,272.



Claim.—1. In a medicated tampon the combination of a soluble casing, a body of medicated material carried thereby, and an expansible fibrous filling for the casing, a portion of the filling protruding from one end of the casing.

2. In a medicated tampon the combination of a soluble casing, a body of medicated material carried thereby in the shape of a plug inserted in one end of the casing, and an expansible fibrous filling for the casing, a portion of the filling protruding from the other end of the casing.

3. In a medicated tampon the combination of a soluble casing, a body of medicated material carried thereby, and expansible fibrous filling for the casing composed of a body of material doubled back upon itself to form a looped portion at one end, said looped portion protruding from one end of the casing, with a withdrawal-string attached to said protruding looped portion.

4. In a medicated tampon the combination of a soluble casing, a plug of soluble medicated material inserted in and filling one end of the casing and protruding therefrom, and a film of cementing material overlapping the adjacent portions of the plug and casing.

5. In a medicated tampon, the combination of a hollow casing of soluble material, entirely open at one end and having a contracted opening at the other end, a body of soluble medicated material adapted to be inserted in and fill the open end of the casing and protrude therefrom, and a fibrous expansible material located in the casing and protruding through the contracted opening at the other end.

6. In a medicated tampon the combination of a soluble casing, a plug of soluble medicated material inserted in and filling one end of the casing and protruding therefrom, and a film of moisture-proof cementing material inclosing the plug and overlapping the adjacent portions of the plug and casing.

7. In a medicated tampon the combination of a soluble casing, a body of medicated material carried thereby in the shape of a plug inserted in one end of the casing, and an expansible fibrous filling for the casing, together with a film of moisture-proof material located between the opposite surfaces of the plug and casing.

812,770. **MEDICATED TAMPON.** EDMUND M. POND, Rutland, Vt. Filed Sept. 12, 1904. Serial No. 224,131.

Claim.—1. A tampon comprising a piece of woven fabric doubled upon itself in folds extending transversely of the axis of the tampon and a body of soluble medicated material together with a casing of soluble material containing said woven fabric and medicated material.

2. A tampon comprising a piece of woven fabric doubled upon itself in folds extending transversely of the axis of the tampon and a body of soluble medicated material together with a casing of soluble material containing said woven fabric and medicated material and a removable cap at one end of the casing.

3. A medicated tampon comprising a closed casing of soluble material consisting of a soluble shell closed at one end and provided with a cap fitting over the other end, a body of medicated material located in one end of said casing in immediate contact with the walls thereof, and a packing of fibrous material occupying the remaining space of such casing.

812,771. **FORK.** WILLIAM A. REDDOCK, Niles, Mich. Filed Apr. 25, 1905. Serial No. 257,238.

Claim.—1. In a fork the combination of a wire doubled upon itself to form a handle and two tines, an intermediate wire provided with a tine, arranged between and upon the parallel wires, and of greater length than the doubled portion, a ferrule binding the wires at the branching of the tines, a second ferrule binding the wires near the opposite end of the doubled portion, a grip encircling the doubled portion and resting on the ferrule, and a ring bent in the extended portion of the intermediate wire for securing the grip in place.

2. In a fork the combination of a wire doubled upon itself to form a handle and two tines, an intermediate wire having a tine arranged between the parallel wires, and extending beyond the doubled portion, means for securing the wires together, a grip encircling the wires, and a ring in the extended portion of the intermediate wire for retaining the grip upon the wires.

3. In a fork the combination of a wire doubled upon itself to form a handle and two tines, an intermediate wire provided with a tine, arranged between the parallel wires and extending beyond the doubled portion, means for securing the wires together, and a ring in the extended portion of the intermediate wire.

4. In a fork the combination of a wire doubled upon itself to form a handle and two tines, an intermediate wire provided with a tine arranged between the parallel wires and extending beyond the doubled portion, a grip on the handle, and a ring integral with the intermediate wire and beyond the handle.

5. In a fork, the combination of a wire doubled upon itself to form a handle, and two tines, an intermediate wire provided with a tine and arranged between the parallel wires of the doubled portion, means for securing the wires together, a grip mounted on the handle and a ring integral with one of the wires for retaining the grip on the handle.

6. In a fork, the combination of a plurality of wires, each provided with a tine, and uniting to form a handle, a grip on the handle, and a ring integral with one of the wires for retaining the grip on the handle.

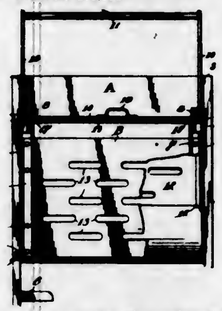
7. A fork comprising a plurality of wires, each provided with a tine, a grip mounted around the wires, and a ring integral with one of the wires for retaining the grip upon the wires.

8. A fork comprising a longitudinally-perforated grip, a plurality of wires, each provided with a tine, and passing through the

grip and a ring formed from one of the wires, beyond the grip, to retain said grip in place upon the wires.

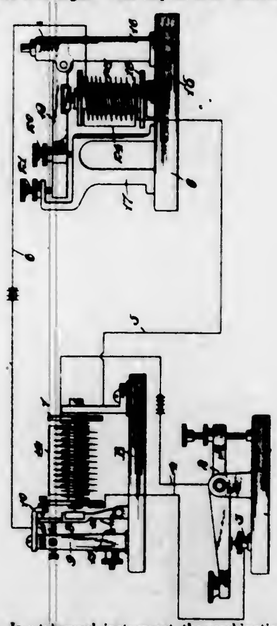
9. The combination of a tubular handle, a rod or tang passed through said handle and bent at the upper end of the latter and exterior thereto into ring form, substantially as set forth.

812,772. **WASHING-MACHINE.** STANLEY K. RICE, Concord, Nebr., assignor of one-half to Miner Coats, Concord, Nebr. Filed May 21, 1904. Serial No. 209,004.



Claim.—In a washing-machine, the combination with a receptacle, of trunnions mounted therein, bearings mounted upon said trunnions, angle-irons secured to said bearings, a rubber supported by and held between the angle-irons, of arms extending upwardly from said bearings and connected together by means of a cross-piece, and of presser-boards secured to the interior of said receptacle.

812,773. **TELEGRAPH INSTRUMENT.** CARL J. SCHWARZE, Adrian, Mich., assignor to Schwarze Electric Company, Adrian, Mich., a Corporation of Michigan. Filed May 21, 1904. Serial No. 210,476.



Claim.—1. In a telegraph instrument, the combination of an armature-actuating energizing-coil, and a closed secondary inductively related to said energizing-coil.

2. A telegraph instrument provided with an induction device on the armature-actuating electromagnet of the instrument so that changes in the magnetic intensity of said magnet have an inductive effect on said inductive device, substantially as described.

3. A telegraph instrument having an electromagnet and armature actuated thereby and also having a closed induction-coil inductively related to said electromagnet, substantially as described.

4. A telegraph instrument having an electromagnet provided with a closed induction-conductor in combination with an armature actuated by said magnet, substantially as described.

5. A telegraph instrument comprising an electromagnet, a vibratory armature therefor, spring means controlling said armature and holding the same normally retracted, a stop against which said armature is normally held, and a closed induction-coil on said electromagnet, substantially as described.

6. A telegraph instrument having its armature-actuating electromagnets provided with closed induction-coils, substantially as described.

812,774. **ROCK-DRILL.** CLARK J. SMITH, Ottumwa, Iowa, assignor to The Hardscog Wonder Drill Company, Ottumwa, Iowa. Original application filed Aug. 12, 1905, Serial No. 273,930. Divided and this application filed Sept. 2, 1905. Serial No. 276,576.

Claim.—1. In an apparatus of the class described, the combination with a drill-casing and a drill carried thereby, of a clamp for receiving said drill-casing, said clamp including means whereby the drill-casing can be swung clear of the drill and back again without changing the alinement of the drill-casing substantially as shown and described.

2. An apparatus of the class described, comprising in combination with a drilling-engine and a drill detachably held therein, of a support for said engine comprising a hinged clamp member whereby the drilling-engine can be swung clear of the drill, substantially as shown and described.

3. A holder for rock-drills and the like comprising a receiving-clamp, a bearing member for receiving said clamp, and means carried by the clamp for engaging the bearing member to prevent the clamp being swung out of alinement with the drilled aperture in one direction.

4. An apparatus of the class described, comprising in combination with a rock-drilling mechanism, of a supporting-clamp adjustably secured thereto, a bearing member to which said clamp is pivotally connected to be swung on its pivot-axis in one direction substantially as shown and described.

5. An apparatus of the class described, the combination with the drilling mechanism, of a clamp for receiving the same, said clamp having a wing provided with a heel, a bearing member for receiving said wing to which it is pivotally secured, a double clamp for receiving said bearing member, a supporting-rod for receiving said double clamp, a second clamp on said supporting-rod and a second supporting-rod for receiving said second clamp substantially as shown and described.

6. An apparatus of the class described, comprising in combination with a drilling mechanism, of a clamp for receiving the same, said clamp having a wing provided with a heel, a bearing member for receiving said wing to which it is pivotally secured.

7. An apparatus of the class described, comprising in combination with a drilling mechanism, and a drill carried thereby, of a supporting member therefor, said supporting member comprising a body portion having a pair of parallel ears and a stud portion, a clamp having a heeled wing held between the ears of the body portion, and pivotally connected thereto with its heel adapted to engage the body portion, said clamp adapted to receive the drilling mechanism substantially as shown and for the purposes described.

8. An apparatus of the class described, comprising a rock-drill, a clamp for mounting said rock-drill in alinement with the aperture to be drilled, said clamp having means whereby said rock-drill may be swung in a direction at right angles to its longitudinal axis to

move the same out of alinement with the drilled aperture, substan-

transverse grooves adapted to form continuations of the annular

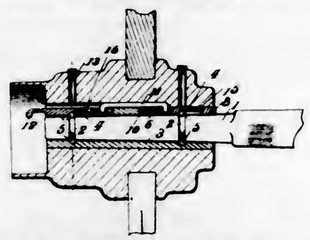
3. That improvement in the art of treating cereals which con-

por with air, passing the mixture over heated copper oxid, and sub-

move the same out of alinement with the drilled aperture, substantially as shown and described.

9. A supporting mechanism for rock-drills comprising in combination with a supporting-arm, and a double clamp member secured thereto, of a supplemental supporting member held by said double clamp member and consisting of a clamp-engaging portion and a drilling-machine-receiving portion pivotally connected together, the drilling-machine-receiving portion adapted to be swung on its pivot-axis, and means for limiting said movement, substantially as shown and described.

812,775. VEHICLE HUB AND SPINDLE. SAMUEL STERLING, Chickasawba, Ark., assignor of one-half to D. D. Hodges, Paragould, Ark. Filed May 26, 1905. Serial No. 263,485.



Claim.—1. In combination, a spindle having an annular groove, an axle-box provided with a mating annular groove, balls fitted into the space formed by means of the mating grooves to reduce friction and form interlocking means to retain the parts in coöperative position, and a slide provided with an opening for the entrance and the exit of the balls and adapted to confine said balls.

2. In a device of the character described, the combination of a spindle having an annular groove therein, an axle-box having a corresponding annular groove in its inner surface and having a slot extending inward from an end part past the annular groove, balls in the spaces formed by the two grooves, and a slide operating in said slot and having a transverse groove adapted to form a continuation of the annular groove in the axle-box and also having an opening for the insertion of balls when the slide is so placed that the opening therein is opposite the annular groove in the spindle.

3. In a device of the character described, the combination of a spindle having an annular groove therein, an axle-box having a corresponding groove in its inner surface and having a slot extending inward from an end and past the annular groove, balls in the spaces formed by the two grooves, a slide operating in said slot and having a transverse groove adapted to form a continuation of the annular groove in the axle-box, and also having an opening for the insertion of the ball when the slide is so placed that said opening is opposite the annular groove in the spindle, and a hub having an opening therein to coöperate with the opening in the side for the removal and insertion of the balls.

4. In a device of the character described, the combination of a spindle having an annular groove therein, an axle-box having a corresponding annular groove in its inner surface and having a slot extending inward from an end part past the annular groove, balls in the spaces formed by the two grooves, and a slide operating in said slot and having a transverse groove adapted to form a continuation of the annular groove in the axle-box and having an opening for the insertion of the balls when the slide is so placed that said opening is opposite the annular groove in the spindle, and also having a handle attached thereto for convenience of operation.

5. In a device of the character described, the combination of a spindle having a plurality of annular grooves therein, an axle-box having corresponding annular grooves in its inner surface and having a slot extending inward from each end, balls in the spaces formed by the grooves, slides operating in said slots and having transverse grooves adapted to form continuations of the annular grooves in the axle-boxes and also having openings for the insertion of the balls when the slides are so placed that said openings are opposite the annular grooves in the spindle, and means for connecting the slides so that they can be operated in unison.

6. In a device of the character described, the combination of a spindle having a plurality of annular grooves therein, an axle-box having corresponding annular grooves in its inner surface and having a slot extending inward from each end, balls in the spaces formed by the grooves, slides operating in said slots and having transverse grooves adapted to form continuations of the annular grooves in the axle-boxes and also having openings for the insertion of the balls when the slides are so placed that said openings are opposite the annular grooves in the spindle, and a rod connecting the two slides so that they can be operated in unison.

7. In a device of the character described, the combination of a spindle having a plurality of annular grooves therein, an axle-box having corresponding annular grooves in its inner surface and having a slot extending inward from each end, balls in the spaces formed by the grooves, slides operating in said slots and having transverse grooves adapted to form continuations of the annular grooves in the axle-boxes and also having openings for the insertion of the balls when the slides are so placed that said openings are opposite the annular grooves in the spindle, means for connecting the slides so that they can be operated in unison, and a hub having openings therein to coöperate with the openings in the slides for the removal and insertion of the balls.

812,776. AUTOMATIC FIRE-ALARM. ALFRED TAYLOR, Victoria, Canada, assignor of one-half to Thomas Henderson Horne, Victoria, Canada. Filed May 13, 1905. Serial No. 260,327.

Claim.—1. In an automatic fire-alarm; the combination with the terminals of an electric-bell circuit, of means for establishing a connection between the terminals and closing a circuit such means comprising, a shallow hermetically-sealed chamber having ends which are edge-bound and normally inwardly convex but susceptible of being outwardly bulged by pressure within the chamber, means for supporting such chamber adjacent to the terminals so that when one or other or both of the ends are outwardly bulged the adjacent end will electrically connect the terminals, and means for positively and normally holding such connecting means off both of the terminals.

2. In an automatic fire-alarm; the combination with the terminals of an electric-bell circuit, of a non-conducting base through which the terminals outwardly and fixedly project, of an open casing adjustably secured to the base, of a shallow hermetically-sealed chamber between the base and the end of the casing, the ends of which chamber are edge-bound and normally inwardly convex, but outwardly extensible under internal pressure to contact with and bridge between the terminals and close the bell-circuit, and means for normally holding such bridging means off the terminals.

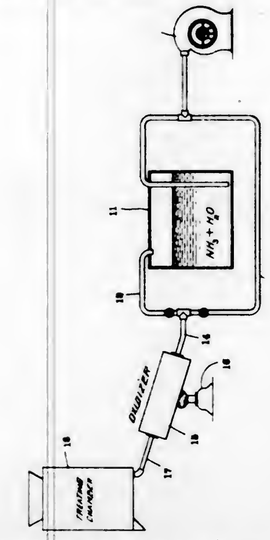
3. In an automatic fire-alarm; the combination with the terminals of an electric-bell circuit, of a base of non-conducting material through which the terminals are carried, such base having a screw-thread receiving a casing designed to retain between the end of the casing and the terminals a shallow hermetically-sealed chamber the ends of which are edge-bound and normally inwardly convex, but susceptible of being outwardly bulged to contact with the exposed terminals of the circuit, of means for normally holding the adjacent end of the chamber off the terminals and means for securing the casing in any desired position of adjustment from the non-conducting base.

4. In an automatic fire-alarm, the combination with an insulating-base having screw-receiving apertures to secure the same to a support and having a central countersunk portion, of an open frame connected with said base and supported thereby, an expandible sealed vessel held within said open frame below the base, a coil-spring seated in said countersunk portion of the base for engaging the sealed vessel, a pair of electric terminals carried by said base, said spring serving to normally hold said sealed vessel out of contact with said terminals and a push-button carried by the open frame and in engagement with said vessel by means of which the vessel can be pushed up into engagement with the electric terminals, substantially as shown and described.

812,777. ART OF TREATING FLOUR. ERNEST R. WHEELER, Indianapolis, Ind. Filed Apr. 20, 1905. Serial No. 256,586.

Claim.—1. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting from the decomposition of ammonia in the presence of oxygen.

2. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting from the decomposition of ammonia in the presence of an oxidizing agent.



3. That improvement in the art of treating cereals which consists in passing ammonia over a heated metallic substance capable of yielding oxygen, and subjecting the cereal to the action of the resulting gas.

4. That improvement in the art of treating cereals which consists in passing ammonia over a heated metallic oxid and subjecting the cereal to the action of the resulting gas.

5. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting from passing ammonia over a heated metallic oxid.

6. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting from passing ammonia over a heated metallic substance capable of yielding oxygen.

7. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting from passing ammonia over a heated substance capable of yielding oxygen.

8. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting from passing ammonia over heated copper oxid.

9. That improvement in the art of treating cereals which consists in passing ammonia over heated copper oxid and subjecting the cereal to the resultant gas.

10. That improvement in the art of treating cereals which consists in subjecting the same to the gas resulting from the mixture of air and the gas resulting from the passage of an air-current laden with vapor of aqua-ammonia over a heated metallic oxid.

11. That improvement in the art of treating cereals which consists in subjecting the same to the gas resulting from the mixture of air and the gas resulting from the passage of an air-current laden with vapor of aqua-ammonia over a metallic substance capable of yielding oxygen.

12. That improvement in the art of treating cereals which consists in forcing air through aqua-ammonia, mixing the resultant vapor with air, passing the mixture over a heated metallic oxid and subjecting the cereal to the action of the resultant gas.

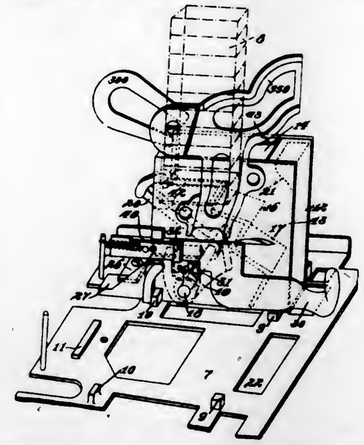
13. That improvement in the art of treating cereals which consists in forcing air through aqua-ammonia, mixing the resultant vapor with air, passing the mixture over a heated metallic substance capable of yielding oxygen, and subjecting the cereal to the action of the resultant gas.

14. That improvement in the art of treating cereals which consists in forcing air through aqua-ammonia, mixing the resulting vapor with air, passing the mixture over heated copper oxid, and subjecting the cereal to the action of the resulting gas.

15. That improvement in the art of treating cereals which consists in subjecting the same to the action of the gas resulting in passing ammonia over a substance capable of yielding oxygen thereto in condition to react thereon.

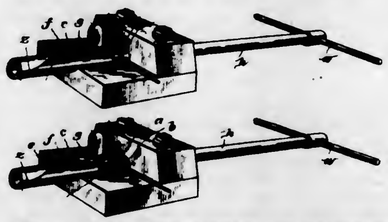
16. That improvement in the art of treating cereals which consists in subjecting the same to the gas resulting from the mixture of air and the gas resulting from the passage of an air-current laden with gaseous ammonia over a substance capable of yielding oxygen thereto in condition to react thereon.

812,778. AUTOMATIC VENDING-MACHINE. ALBERT E. WYATT, Hoboken, N. J., assignor to The Great American Automatic Vending Machine Company, Hoboken, N. J., a Corporation of New Jersey. Filed June 17, 1905. Serial No. 265,868.



Claim.—In a coin-controlled apparatus, the combination with a pull-bar having a lug provided with a forwardly-facing abutment, of a shaft, an ejector mounted thereon, a plate mounted on the shaft carrying a rearwardly-facing abutment the space between said oppositely-facing abutments being normally wider than the diameter of the coin which it is intended the apparatus shall be operated with, means for retracting the pull-bar, an abutment on the said plate located at the rear of said lug on the pull-bar for retracting the ejector, a lug for limiting the rearward position of the rearwardly-facing abutment on said plate and for supporting a coin between said coin-engaging abutments and for engaging and ejecting the coin upon the retraction of the parts.

812,779. WIRE-BENDING MACHINE. RAYMOND B. ACKLEY, Rockford, Ill., assignor of one-half to Albert B. Hix, Kingston, Ill. Filed Aug. 12, 1905. Serial No. 273,894.



Claim.—1. In mechanism for bending wire, the combination with a rod having a mandrel extension from an annular shoulder, of a gage, and a tubular guide having an axial extension provided with a longitudinal opening having a cam-margin and terminating in a discharge-slot, substantially as specified.

2. In mechanism for bending wire, the combination with a rod having a mandrel extension from a shoulder, and means for making

an initial bend in the wire, of a gage or stop, and a tubular guide hav-

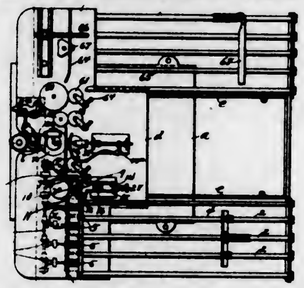
3. In a rail-joint, the rail splice-bar having a longitudinal groove

an initial bend in the wire, of a gage or stop, and a tubular guide having a cam extension terminating in a discharge-slot, substantially as specified.

3. In mechanism for bending wire, the combination with a rod having a mandrel extension and means for making an initial bend in the wire, of a gage or stop, a tubular guide having a cam extension terminating in a discharge-slot, and means for giving motion of reciprocation, substantially as specified.

4. In mechanism for bending wire, the combination with a rod having a mandrel extension provided with a flattened cam extension, of a gage or stop, and a tubular guide having a longitudinal opening provided with a cam-margin and terminating in a discharge-slot, substantially as specified.

812,780. **FEED MECHANISM FOR STAMP-CANCELING AND POSTMARKING MACHINES.** FREDRIK BJURSTRÖM, New York, N. Y. Original application filed July 8, 1904, Serial No. 215,834. Divided and this application filed Jan. 19, 1905. Serial No. 241,736.



Claim.—1. The combination with upright canceling and stamping rolls, of upright side feedway-rolls, horizontal edge feeding-rolls, reversely-operating retarding side roll, controlling-stop, pusher adapted for releasing the letters singly from said stop, and means for operating said rolls and pusher.

2. The combination with canceling and stamping rolls, feed-rolls thereto and discharge-rolls therefrom, of the reversely-operating retarding-roll of the feed-train, means for automatic adjustment of said retarding-roll relatively to its companion roll, and means for operating the several rolls, a controlling-stop, and a pusher.

3. In a system of letter-feeding rolls, the combination with the feedway for the letters in mass, and with the canceling and marking dies, of a pair of rolls comprising a direct-acting, and a reversely-acting roll, and means for driving said rolls, of a controlling-stop, pusher for releasing the letters from said stop and means for operating said pusher through the instrumentality of the roll-driving means.

4. In a system of letter-feeding rolls, the combination with the feedway for the letters in mass and with the canceling and marking dies, of a pair of rolls comprising a direct-acting and a reversely-acting roll, of a controlling-stop, pusher for releasing the letters from said stop, and means for operating said pusher consisting of the pusher-carrying slide, roll-carrying shaft and the crank-pin of said shaft operating the pusher.

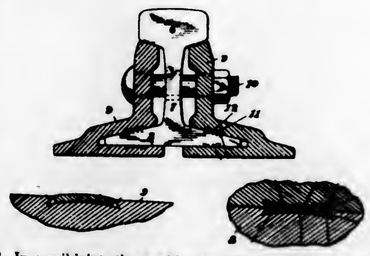
5. In a system of letter-feeding rolls, the combination with the feedway and the canceling and marking dies, of a pair of rolls, an adjustable bearing for one of said rolls, and adjustable support for said bearing, spring for closing said rolls, and a temper-screw for regulating such closure.

812,781. **ELECTRICALLY-CONDUCTIVE RAIL-JOINT AND BOND THEREFOR.** BANCROFT G. BRAHER, New York, N. Y., assignor, by mesne assignments, to The Rail Joint Company, a Corporation of New York. Filed Apr. 11, 1904. Serial No. 202,511.

Claim.—1. The combination with the rails and splice-bar, the latter having grooves with opposite undercut walls, of conductive plates inserted in said grooves, and projecting at their opposite edges against the undercut side walls, substantially as set forth.

2. The combination with the grooved rails and grooved splice-bars, the grooves of the rails and connecting-plates having convex bottoms and undercut side walls, of plates arranged in said grooves and facing one another, the said plates when pressed into place being thin at the centers of the convexities and thicker at the side walls, substantially as set forth.

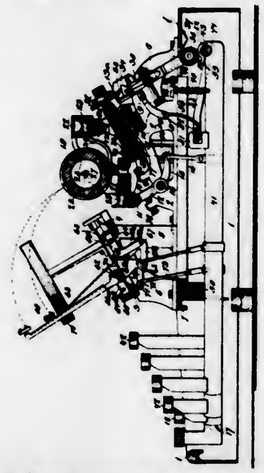
3. In a rail-joint, the rail splice-bar having a longitudinal groove therein which has a convex bottom and undercut side walls, substantially as set forth.



4. In a rail-joint, the combination with a rail having a base-flange, of splice-bars having bearings against said flange, said splice-bars having grooves which are provided with centrally-convex bottoms and undercut side walls, and electrically-conductive plates arranged in said grooves and extending over the said convex bottoms from one undercut side wall to the opposite undercut side wall.

5. In a rail-joint the combination with a rail having a base-flange, of splice-bars having bearings against said base-flange, said splice-bars having a longitudinal groove which is provided with undercut side walls adapted to receive and hold projecting electrically conductive plates.

812,782. **TYPE-WRITING MACHINE.** BYRON A. BROOKS, Brooklyn, N. Y., assignor to Union Typewriter Company, Jersey City, N. J., a Corporation of New Jersey. Original application filed Jan. 28, 1899, Serial No. 703,642. Divided and this application filed Feb. 20, 1900. Serial No. 5,901.



Claim.—1. The combination of an endwise-movable carriage, a platen mounted thereon, and movable transversely to the line of travel and obliquely to the horizontal plane of the machine, means for at will so moving the platen transversely, a series of pivoted horizontally-disposed key-levers extending under the carriage and to the front of the machine, a series of type-bars pivoted in front of the platen below the horizontal plane thereof and each of which swings on a single pivotal center, and normally inclined away from the platen toward the front of the machine, a segment arranged obliquely to a horizontal plane and on which said type-bars are pivoted, two or more characters rigidly secured to each type-bar and operative connections between each type-bar and its corresponding key-lever.

2. The combination of a platen, movable endwise and transversely in a plane oblique to the horizontal plane of the machine, means for at will moving the platen obliquely, transversely, a series of type-bars pivoted in front of the platen and each swinging on a

single pivotal center and having more than one character thereon, a segment arranged obliquely to a horizontal plane and on which said type-bars are pivoted, a series of horizontally-disposed key-levers pivoted at the rear of the machine and extending forward under the platen and type-bars, and operative connections between each key-lever and its corresponding type-bar.

3. In a type-writing machine, the combination of type-bars each provided with a plurality of type projecting rearwardly when the type-bar is in the normal position, said type-bars being pivoted in an arc oblique to the horizontal and each type-bar swinging on a single pivotal center and striking rearwardly and downwardly, a platen arranged with its printing-point between the top and the front thereof, and a platen-carriage arranged to vibrate in a line parallel with the type on the type-bars at the point of impression.

4. In a type-writing machine, the combination of a platen-carriage, a guide-rail upon which said platen-carriage is hinged; a second rail upon which said carriage is independently hinged, said carriage being constructed and arranged to travel along upon said rails, links or arms connected to said rails and pivoted upon the frame of the machine, a shifting key-lever, and a connection between said lever and said rails for vibrating the latter to shift the platen in a line with the types at the point of impression, at any portion of the endwise travel of the carriage along said rails.

5. In a type-writing machine, the combination of a platen, type-bars provided with a plurality of type and pivoted in front of and below the level of the printing-point at the upper front side of the platen and the plane of the type-faces on a type-bar when the type are at the impression-point being oblique to the horizontal, parallel guide or track rails for the platen-carrier arranged in a plane oblique to the horizontal, rock-shafts and arms supporting said track-rails, said rock-shafts being arranged in a plane oblique to the horizontal and all said planes being parallel or substantially parallel to each other, and means for rocking one of said rock-shafts to vibrate the platen into positions for coaction with said type upon the type-bars.

6. In a type-writing machine, the combination of a front guide-rail at one level, a rear guide-rail at a higher level, a platen having the printing-point at its upper front side, a platen-carriage traveling on said guide-rails, type-bars provided with a plurality of type and pivoted in an arc or arcs parallel or substantially parallel with the plane of said guide-rails and striking rearwardly and downwardly, and mechanism for shifting said carriage-guide rails and platen-carriage in or substantially in the direction of the plane of said type when they are at the impression-point.

7. In a type-writing machine, the combination of type-bars provided with a plurality of type and pivoted in an arc or arcs oblique to the horizontal and striking rearwardly and downwardly, a platen arranged with its printing-point between the top and the front thereof, a power-driven platen-carriage arranged to vibrate in a line parallel or substantially parallel with the plane of the type on the type-bars when at the point of impression, a rack-bar connected with the carriage and having its plane at right angles to the direction of shift of said carriage, an oblique shaft on the main frame, a pinion on said shaft engaging with said rack-bar, an escapement for controlling said shaft, finger-keys, and connections between said keys and type-bars and said escapement.

8. In a type-writing machine, the combination of a platen arranged with its printing-point between the top and the front thereof, a power-driven platen-carriage arranged to vibrate in a direction oblique to the horizontal, a rack-bar connected with said platen-carriage and having its plane at or substantially at right angles to the direction of vibration of said carriage, a shaft journaled in the main framework and having a gear-wheel engaging with said rack, an escapement for controlling said shaft, and key-operated type mechanism having type adapted to coact with the platen in the normal and the shifted positions thereof.

9. In a type-writing machine, the combination of a horizontally-traveling platen-carriage, parallel front and rear guide-rails therefor, two pairs of obliquely-arranged arms connected to said guide-rails, at their upper ends and pivotally mounted at their lower ends, means for swinging said pairs of arms and said guide-rails, and thus shifting the carriage and platen, and type-bars provided each with a plurality of types and pivotally mounted so as to strike the platen at a common center at a point between its frontmost side and its topmost side.

10. In a type-writing machine, the combination of a platen, a series of pivoted type-bars each provided with a plurality of types rigidly secured thereto, said type-bars being pivoted in an arc which lies in an oblique plane, and being constructed and arranged to strike between the top and front of the platen, a shift-key, and connections between said shift-key and said platen constructed and arranged to enable the platen to shift obliquely and in a plane coincident with or parallel to the oblique plane in which the type-bar pivots are situated.

11. The combination of the platen movable endwise and also transversely in a plane oblique to the horizontal plane of the machine, means for at will moving the platen transversely, a series of type-bars pivoted in front of the platen, the pivots of the type-bars being situated in one or more planes oblique to a horizontal plane and each type-bar having more than one character thereon, a series of horizontally-disposed key-levers pivoted at the rear of the machine and extending forward under the platen and type-bars, and a series of angular levers or bell-cranks pivoted below the type-bars and each operatively connecting a key-lever with its corresponding type-bar.

12. The combination of an endwise-movable carriage, a platen mounted thereon and movable transversely to the line of travel and in a direction inclined to a horizontal plane, means for at will so moving the platen transversely, a series of pivoted horizontally-disposed key-levers extending under the carriage and to the front of the machine, a series of type-bars pivoted in front of the platen below the horizontal plane thereof and each of which swings on a single pivotal center, and normally inclined away from the platen toward the front of the machine, a segment arranged obliquely to a horizontal plane and on which said type-bars are pivoted, two or more characters rigidly secured to each type-bar and operative connections between each type-bar and its corresponding key-lever.

13. The combination of a platen traveling endwise and movable upon pivoted parallel link connections upwardly and rearwardly in a plane oblique to the horizontal plane of the machine, means for at will so moving the platen obliquely and permitting its return by gravity, a series of type-bars pivoted in front of and normally inclined away from the platen, a series of key-levers pivoted in rear of and extending forward under the type-bar pivots, and operative connections between the key-levers and type-bars.

14. The combination of an endwise-movable platen mounted to be shifted transversely in a plane oplique to the horizontal plane of the machine, a series of pivoted type-bars each having more than one character thereon, in front of the platen and normally lying inclined toward the front of the machine and arranged to strike downwardly upon the upper front quarter of the platen, a series of key-levers pivoted in rear of the type-bar pivots, a series of levers interposed between the type-bars and key-levers and operative connections between the interposed levers, key-levers and type-bars.

15. In a type-writing machine, the combination of a platen, a series of pivoted type-bars each provided with a plurality of types rigidly secured thereto, said type-bars being pivoted in an arc on a support which lies in an oblique plane, and being constructed and arranged to strike between the top and front of the platen, a shift-key and connections between said shift-key and one of said platen and type-bar support members constructed and arranged to shift such member obliquely and in a plane coincident with or parallel to the oblique plane in which the type-bar pivots are situated.

16. The combination of an endwise-movable carriage, a platen mounted thereon, and movable transversely to the line of travel and obliquely to the horizontal plane of the machine, means for at will so moving the platen transversely, a series of pivoted horizontally-disposed key-levers extending under the carriage and to the front of the machine, a series of type-bars pivoted in front of the platen below the horizontal plane thereof and each of which swings on a single pivotal center, and normally inclined away from the platen toward the front of the machine, a support arranged obliquely to a horizontal plane and on which said type-bars are pivoted, two or more characters rigidly secured to each type-bar and operative connections between each type-bar and its corresponding key-lever.

17. The combination of an endwise-movable carriage, a platen mounted thereon and movable transversely to the line of travel and in a direction inclined to a horizontal plane, means for at will so moving the platen transversely, a series of pivoted horizontally-disposed key-levers extending under the carriage and to the front of the machine, a series of type-bars pivoted in front of the platen below the horizontal plane thereof and each of which swings on a single pivotal center, and normally inclined away from the platen toward the front of the machine, a support arranged obliquely to a horizontal plane and on which said type-bars are pivoted, two or more characters rigidly secured to each type-bar and operative connections between each type-bar and its corresponding key-lever.

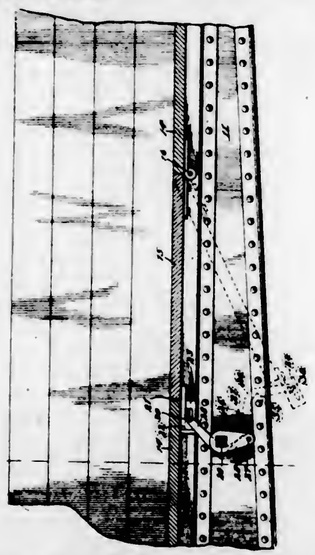
18. In a type-writing machine, the combination of a platen, a series of pivoted type-bars each provided with a plurality of types

rigidly secured thereto, said type-bars pivoted in an arc which lies

connected at one end to said crank-arm; a pin-and-slot connection

rigidly secured thereto, said type-bars pivoted in an arc which lies in a plane oblique to the horizontal plane of the machine, and being constructed and arranged to strike between the top and front of the platen, a shift-key, and connections between said shift-key and said platen constructed and arranged to enable the platen to shift obliquely and in a plane parallel to the oblique plane in which the type-bar pivots are situated.

812,783. CAR-DOOR-OPERATING MECHANISM. ARGYLE CAMPBELL, Chicago, Ill., assignor to The Enterprise Railway Equipment Company, Chicago, Ill., a Corporation of Illinois. Filed Dec. 2, 1905. Serial No. 290,096.



Claim.—1. In mechanism of the class described, in combination with a suitable supporting-frame; a hinged car-door to be moved between closed and open positions; a shaft pivotally mounted adjacent to, but clear of, the line of travel of the front edge of the door; a crank-arm on said shaft and a connecting-rod of greater length than the crank-arm connected at one end to the crank-arm and at the other end to the door; and a pin or roller carried by one of the members of the mechanism sliding in a slot in an adjacent member of the mechanism, whereby the shaft may be rotated between two different positions to open and close the door, as described.

2. In mechanism of the class described, in combination with a suitable supporting-frame; a hinged car-door to be moved between closed and open positions; a shaft pivotally mounted adjacent to, but clear of, the line of travel of the front edge of the door; a crank-arm on said shaft and a connecting-rod of greater length than the crank-arm connected at one end to the crank-arm and at the other end to the door; a pin or roller carried by one of the members of the mechanism sliding in a slot in an adjacent member of the mechanism, whereby the shaft may be rotated between two different positions to open and close the door; means for rotating said shaft; and means for locking the same in closed position.

3. In mechanism of the class described, in combination with suitable supporting mechanism, and a hinged car-door to be opened and closed; a shaft mounted approximately parallel to the axis of the hinge of the door adjacent to, and clear of, the swinging front edge of the door; a crank-arm upon said shaft; a connecting-rod pivotally connected at one end to said crank-arm, and a pin-and-slot connection between the opposite end of the crank-arm and the door, whereby the shaft may be rotated between two different positions to open and close the door.

4. In mechanism of the class described, in combination with suitable supporting mechanism, and a hinged car-door to be opened and closed; a shaft mounted approximately parallel to the axis of the hinge of the door, adjacent to and clear of the swinging front edge of the door; a crank-arm upon said shaft; a connecting-rod pivotally connected at one end to said crank-arm; a pin-and-slot connection between the opposite end of the crank-arm and the door, whereby the shaft may be rotated between two different positions to open and close the door; and mechanism for operating the shaft and for locking the shaft with the door in closed position.

5. In mechanism of the class described, in combination with a suitable supporting-frame and a hinged door to be opened and closed; a shaft parallel to the axis of the hinge of the door mounted clear of but adjacent to the path of travel of the front edge of the door and in a line approximately perpendicular to the plane of the door when the door is closed; a crank-arm on said shaft normally extending away from the door, a connecting-rod having one end pivotally mounted on said crank-arm, extending toward the door past the shaft on its side away from the hinge of the door, and a pin-and-slot connection between the second end of the connecting-rod and the door.

6. In mechanism of the class described, in combination with a suitable supporting-frame and a hinged door to be opened and closed; a shaft parallel to the axis of the hinge of the door, mounted clear of but adjacent to the path of travel of the front edge of the door; mechanism for rotating the shaft and for locking it in desired position; a crank-arm on said shaft normally extending away from the door; a connecting-rod having one end pivotally mounted on said crank-arm, extending toward the door past the shaft on its side away from the hinge of the door to a point in which its second end of the connecting-rod is in approximately the same plane perpendicular to the door as the crank-pin on its lower end, and a pin-and-slot connection between the second end of the connecting-rod and the door, whereby as said shaft is rotated said door is opened and closed, as described.

7. In a car, in combination with the underframe and a normally level pivoted floor-door, adapted to be opened and closed to discharge the load, a shaft mounted below the floor of the car adjacent to the path of travel of the edge of the floor-door for rotating said shaft; means for locking said shaft in a desired position; a normally downwardly-extending crank-arm on said shaft; and a connecting-rod of greater length than said crank-arm pivotally mounted at one end upon said crank-arm, extending toward the door on the side of the shaft away from the hinge of the door, and having its opposite end pivotally connected to the door, there being a slidable connection between two adjacent members of the mechanism whereby rotating the shaft between two different positions opens and closes the door, as described.

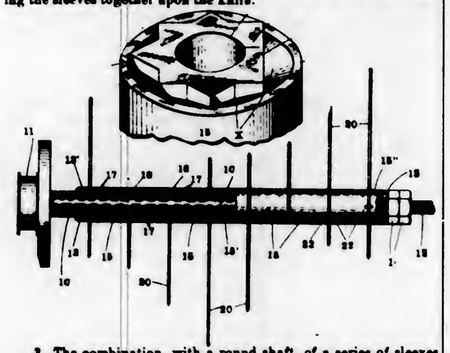
8. In a car, in combination with a suitable underframe, and a car-floor having doors therein adapted to swing down to discharge load; a shaft journaled below the floor of the car adjacent to the swinging edge of the door; a crank-arm normally depending from said shaft; a connecting-rod of greater length than the crank-arm pivotally connected to the crank-arm, extending past the shaft on the side away from the hinge of the door toward the door to a position in which the upper end of the crank-arm and the pivot on its lower end are normally in approximately a vertical line; a pin upon the upper end of said crank-arm adapted to travel in slot upon the floor-door; and mechanism for rotating said shaft and for locking it in the desired position.

9. In mechanism of the class described, in combination with a suitable supporting-frame and a door to be opened and closed; a crank-arm pivoted adjacent to the path of travel of the edge of the door; means for rotating said crank-arm and for securing it in desired position; a connecting-rod pivotally connected to the crank-arm and connected by pin-and-slot connection to the door, the whole being so arranged that by rotating the shaft to one position the door may be closed, and that by rotating the shaft to another position the door swings past the pivot of the crank-arm and is given a wide opening due to the connecting-rod and crank-arm being in approximately a straight line, as described.

812,784. BAND-CUTTER. HARRY C. CLAY and MARSHAL T. REEVES, Columbus, Ind., assignors to Reeves & Company, Columbus, Ind., a Corporation of Indiana. Filed Jan. 5, 1905. Serial No. 239,826.

Claim.—1. The combination, with a shaft and spacing-sleeves carried thereby, of a boss carried by one of said sleeves and extending axially into a socket formed in the adjacent sleeve, the said boss having one transverse dimension of less magnitude than a parallel dimension at greater distance from the axis, a knife having an open notch formed in one edge thereof and fitting said boss, the said open socket being of less width at its open end than the width farther in, whereby the knife when applied to the boss may not be transversely withdrawn, and means for clamping the sleeves together upon the knife.

2. The combination, with a shaft, of a knife having an open notch formed in one edge, said notch having a transverse dimension near its open end less than a parallel dimension near the inner end of the notch, means carried by the shaft for entering and fitting said notch, spacing-sleeves mounted on the shaft, and means for clamping the sleeves together upon the knife.



3. The combination, with a round shaft, of a series of sleeves freely rotatably thereon, each sleeve being provided at one end with a non-cylindrical boss and at the other end with a socket adapted to receive the boss of the adjacent sleeve, a collar secured to the shaft and adapted to coact with the adjacent sleeve, the said sleeves being provided on their adjacent ends with annular clamping-surfaces between which knives may be clamped, a series of knives each provided in its back edge with an open notch adapted to receive the boss of a sleeve, said notch and boss fitting and the notch having a transverse dimension near its open end less than a parallel dimension near the inner end, thus being of such character as to prevent transverse withdrawal of the knife when in position, and means for clamping the several sleeves together on the shaft.

4. In a cutter structure, a knife-holding sleeve consisting of a bored main body having a boss at one end and at the other end a corresponding socket adapted to receive the boss of an adjacent sleeve, said sleeve being provided at each end with a trued annular surface at an angle to the axis of the sleeve, and a cutter-blade clamped between the trued surfaces of adjacent sleeves so as to rotate therewith.

5. In a cutter structure, a knife-holding sleeve consisting of a bored main body having a boss at one end and at the other end a corresponding socket adapted to receive the boss of an adjacent sleeve, said sleeve being provided at each end with a trued annular surface at an angle to the axis of the sleeve, and having a cupped portion between said trued annulus and the boss, and a cutter-blade clamped between the trued surfaces of adjacent sleeves so as to rotate therewith.

6. In a cutter structure, a knife-holding sleeve consisting of a bored main body having at one end a non-cylindrical boss and at the other end a corresponding socket adapted to receive the boss of an adjacent sleeve, said sleeve being provided with an external marking means to indicate its proper relationship to the adjacent sleeves.

7. A knife for a cutter structure having a notch cut in its rear edge, the open end of said notch being of less width than other portions of the notch.

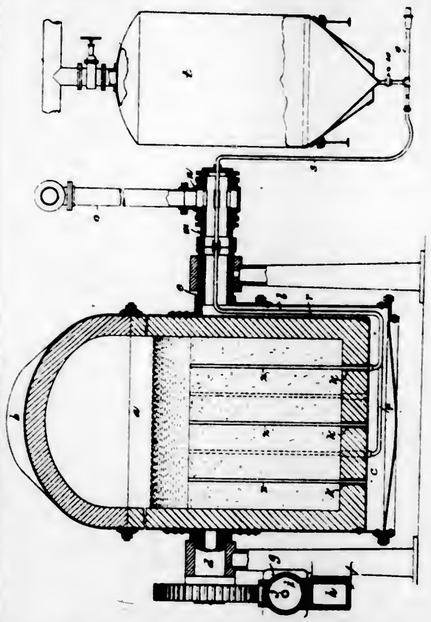
8. A knife for a cutter structure having a notch cut in its rear edge, the open end of said notch being of less width than other portions of the notch and both the tip and the heel of the cutter adjacent the notch being sharpened.

812,785. PROCESS OF SMELTING AND CONVERTING ORES. ARTHUR M. DAY, Butte, Mont. Original application filed Oct. 20, 1904, Serial No. 229,068. Divided and this application filed Apr. 19, 1905. Serial No. 256,494.

Claim.—1. The process of smelting ore consisting in covering a charge of the ore with a molten substance containing sufficient heat to start fusion of the charge, and supplying air to the charge at or near the varying melting-level as fusion progresses downward, substantially as described.

2. The process of smelting ore consisting in covering a charge of the ore with a molten substance containing sufficient heat to start fusion of the ore, and injecting fuel in a fluent form with air into the charge at or near the melting zone or level below the molten covering as fusion progresses downward, substantially as described.

3. The process of smelting ore consisting in applying heat to the top of the charge, forcing air into the charge and simultaneously injecting into the charge at or near the melting-level as fusion progresses downward, fluent material with an auxiliary air-blast separate from the main air-blast, substantially as described.



4. The process of smelting ore or matte consisting in injecting into the charge of ore or matte at the melting-level fuel in fluent from with a blast of air separate and distinct from the main air-blast, substantially as described.

5. The process of smelting or converting ore or matte consisting in forcing air into the charge and injecting fuel in fluent form with an air-blast separate and distinct from the main air-blast, substantially as described.

6. The process of smelting ore consisting in applying heat to the top of the charge, forcing air into the charge and simultaneously injecting into the charge at or near the melting-level as fusion progresses downward, independently-regulated supplies of different kinds of material with auxiliary air-blasts separate from the main air-blast, substantially as described.

7. The process of smelting ore and converting matte which consists in forcing air into the charge of ore or matte and injecting into the charge independently-regulated supplies of fuel and silicious material in a fluent form with air-blasts separate from the main air-blast, substantially as described.

8. The process of smelting ore consisting in covering a charge of the ore with a molten substance containing sufficient heat to start fusion of the charge, supplying air to the top of the charge below the molten substance as fusion progresses downward, and injecting a flux and fuel in a fluent form with air into the charge at or near the melting zone or level as it progresses downward, substantially as described.

9. The process of smelting ore consisting in covering a charge of the ore with a molten substance containing sufficient heat to start fusion of the charge, supplying air under pressure to the top of the charge below the molten covering and injecting with separate and distinct air-blasts, fuel and silicious material delivered at or near the melting-level as it progresses downward, substantially as described.

10. The process of smelting ore consisting in drying the top of the charge, covering it with a molten substance containing sufficient heat to start fusion of the charge, and supplying air under pressure to the charge at or near the melting-level as fusion progresses downward, substantially as described.

11. The process of smelting ore consisting in covering a charge

of the ore with a molten substance containing sufficient heat to start fusion of the charge, supplying air under pressure to the top of the charge below the molten covering and drawing off from time to time

ing for the upper end of the kiln, a chimney-stack removing waste gases from the housing, an auxiliary flue also connected to the housing for abstracting a portion of the waste gases therefrom, a suction-

gaging with the riveter and with the support to move the riveter to inoperative position, a rock-shaft carrying an operating-lever and a pinion, a supplementary lever on said operating-lever, a rack on the

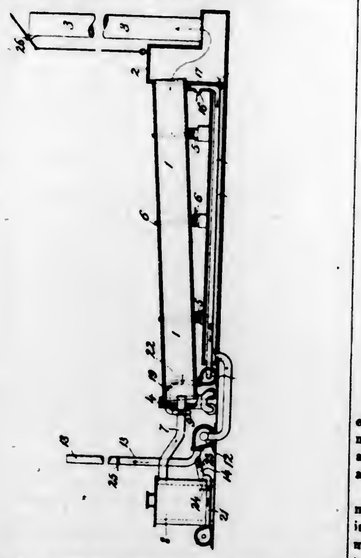
arch, an air-tube at the rear side of said depending plate and provided with air-jet orifices, and provided with one or more branches extending up through and within the shell and communicating with

of the ore with a molten substance containing sufficient heat to start fusion of the charge, supplying air under pressure to the top of the charge below the molten covering and drawing off from time to time the slag accumulating at the surface as fusion progresses downward, substantially as described.

12. The process of smelting crude ore containing or mixed with a combustible substance such as sulfur, consisting in covering a charge of the ore with a molten substance containing sufficient heat to start fusion of the charge, supplying air under pressure to the top of the charge below the molten covering as fusion progresses downward, and injecting fuel, flux and silicious material in a fluent form, with air-blasts delivered at or near the melting-level, substantially as described.

13. The process of smelting ore or matte consisting in the application of heat and a blast of air to the charge and in forcing fuel in a fluent form into the charge with an air-blast separate from the main air-blast, substantially as described.

812,786. **HEAT-RECUPERATOR FOR CEMENT-KILNS.** CARLETON ELLIS, New York, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Original application filed Apr. 18, 1905. Serial No. 256,946. Divided and this application filed Aug. 11, 1905. Serial No. 273,845.

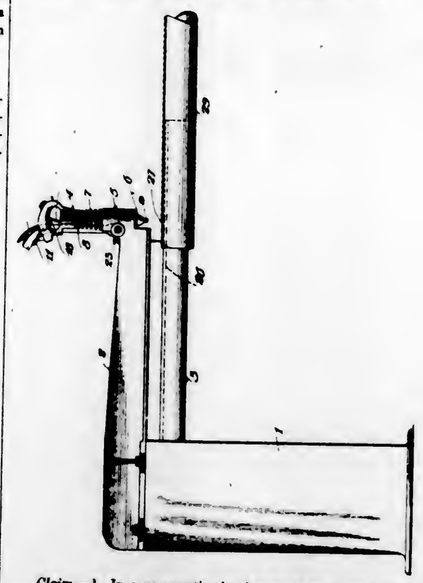


Claim.—1. In a cement-making apparatus, the combination of a kiln, a fuel-burner for one end of the kiln, a dust-collecting housing for the other end of the kiln, a chimney-stack connected to and removing waste gases from the housing, an auxiliary flue also connected to the housing and abstracting a portion of waste gases therefrom and delivering the same adjacent the other end of the kiln, a surface air-heater contained in the auxiliary flue and delivering heated air to the fuel-burner, and power-driven means for inducing and controlling the flow of the abstracted waste gases through said flue in a direction contrary to the direction of the normal flow of the main body of waste gases through the housing and stack, whereby a quieting and dust-settling zone is created between the two lines of flow.

2. In a cement-making apparatus, a gas-fired kiln, a gas-producer supplying gas thereto, a housing for the upper end of the kiln, a chimney-stack removing waste gases from the housing, an auxiliary flue also connected to the housing for abstracting a portion of waste gases therefrom, a surface air-heater contained in the flue, power-driven means for inducing and controlling a flow of waste gases through the flue and thereby regulating the heating of the air, a pipe connection from the heater delivering heated air into the gas-fired end of the kiln, and a pipe connection delivering cooled waste gases from the flue into the gas-producer.

3. In a cement-making apparatus, an inclined rotary gas-fired kiln, a gas-producer supplying gas to the kiln, a dust-collecting housing for the upper end of the kiln, a chimney-stack removing waste gases from the housing, an auxiliary flue also connected to the housing for abstracting a portion of the waste gases therefrom, a surface air-heater contained in the flue, power-driven means for inducing and controlling a flow of waste gases through the flue and thereby regulating the heating of the air, a pipe connection between the heater and the gas-burner of the kiln, and a pipe connection abstracting a portion of the cooled waste gases from the flue and delivering the same into the gas-producer.

812,787. **PNEUMATIC RIVETING-MACHINE.** JOHN R. FRENCH, Los Angeles, Cal. Filed Feb. 1, 1904. Serial No. 191,443.



Claim.—1. In a pneumatic riveting-machine, a support, a riveter movably mounted therein and provided with valve mechanism, means for moving the riveter, and a connector from the valve mechanism to said means so arranged as to be operable to control the valve at any position of the riveter.

2. In a pneumatic riveting-machine, a support, a longitudinally-movable riveter mounted therein and provided with valve mechanism, a lever for moving the riveter, and a connector longitudinally movable from the valve mechanism to the lever so arranged as to control the valve at any position of the lever and riveter.

3. In a pneumatic riveting-machine, a support, a riveter movable thereon and having a controlling-valve, a handle connected to the riveter to move it on its support, and controlling means on said handle connected to said valve.

4. In a pneumatic riveting-machine, a support, a riveter movable thereon, a pivoted hand-lever connected to move the riveter, a controlling-valve for the riveter, a member pivoted concentrically with the said hand-lever and connected to said controlling-valve, and operating means on the hand-lever connected to said member.

5. In a pneumatic riveting-machine, a support, a riveter movable thereon, and provided with a controlling-valve, a pivoted hand-lever connected to move the riveter, a rocking member connected to the controlling-valve and a supplementary lever on the hand-lever connected to said rocking member.

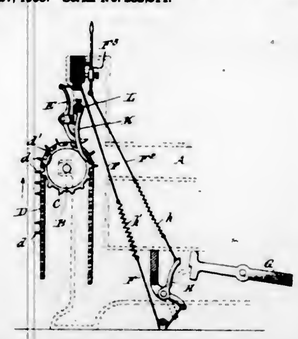
6. In a pneumatic riveting-machine, a work-holder, a support, a riveter mounted to move vertically on said support, a rock-shaft pivoted on said support, an operating-handle on said rock-shaft, a pinion in said rock-shaft, a rack on the riveter engaged by said pinion, a rocking member loose on said rock-shaft, a supplementary lever on the aforesaid handle, a controlling-valve for the riveter, and connections from said rocking member to said supplementary lever and to said valve.

7. In a pneumatic riveting-machine, a support, a riveter sliding in said support and provided with a controlling-valve, a spring engaging with the riveter and with the support to move the riveter to inoperative position, a rock-shaft carrying an operating-lever and a pinion, a supplementary lever on said operating-lever, a rack on the riveter engaged by said pinion, a ring mounted to turn on said rock-shaft, and members connecting said ring with said supplementary lever and said valve.

8. In a pneumatic riveting-machine, a support, a longitudinally-movable riveter mounted therein and provided with valve mechanism, means for moving the riveter, a longitudinally-movable connector from the valve mechanism to said means, means for moving the connector longitudinally without operating the valve mechanism as the riveter is moved longitudinally, and means for moving the connector at any time to operate the valve mechanism.

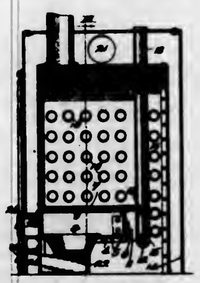
9. In a pneumatic riveting-machine, a longitudinally-movable riveter provided with a valve, a lever for operating the valve, a handle provided with means for moving the riveter longitudinally, a lever on said handle, a longitudinally-movable flexible connector from the valve-lever to the lever on the handle, and means for taking up the slack of said connector as the riveter is moved longitudinally in its support.

812,788. **TERRY-LOOM.** HORACE S. GRIFFITH, Glen Riddle, Pa. Filed Mar. 27, 1905. Serial No. 252,314.



Claim.—In a loom provided with a terry-motion, the combination with the lever which puts on and off the terry-motion, of an automatic shifting mechanism for operating said lever to throw on and off said motion, consisting of the sand-roller, a sprocket-wheel attached to said roller, a pattern-chain meshing with said wheel provided with projecting pins, a lever pivotally suspended above said chain having its lower end in the path of said pins, a chain F connected to the upper end of said suspended lever, a spring-held locking-pawl attached to said chain F and adapted to engage the notched end of said lever which puts on and off the terry-motion.

812,789. **FURNACE.** WELLESLEY R. HAMPDEN, Kansas City, Mo., assignor, by direct and mesne assignments, to The Fuel Saver Heating Company, a Corporation of Missouri. Filed July 23, 1905. Serial No. 270,708.



Claim.—1. A furnace, comprising a shell or body, a fire-pot therein, a wall rising upwardly rearward of the fire-pot, an arch over said fire-pot and said wall and projecting rearwardly beyond the latter, a plate disposed between and out of contact with said upwardly-projecting wall and the rear wall of the shell and depending from the arch, an air-tube at the rear side of said depending plate and provided with air-jet orifices, and provided with one or more branches extending up through and within the shell and communicating with the atmosphere, and a combustion-flue communicating with the upper portion of the shell.

2. In a furnace, the combination of a shell or body, a fire-pot therein, a wall rising upwardly rearward of the fire-pot, an arch over said fire-pot and said wall and projecting rearward beyond the latter, a plate disposed between and out of contact with said wall and the rear wall of the shell and depending from the arch, an air-tube at the rear side of said depending plate and provided with air-jet orifices and one or more branches extending up through and within the shell and communicating with the atmosphere, a combustion-flue communicating with the upper portion of the shell, and a series of tubes within the shell between the air-tube and the combustion-flue.

3. In a furnace, the combination of the shell, a substantially horizontal plate connecting the sides and front wall of the shell and terminating short of the rear wall thereof, a fire-pot disposed below said plate and communicating with the space above the same, an ash-pit below the fire-pot, an arch above the fire-pot and said plate and projecting rearwardly beyond the latter, a wall projecting from said plate rearward of the fire-pot and terminating short of the top of the arch and extending from side wall to side wall of the latter, a plate depending from the rear end of the arch to a point below the top of the wall below the arch, a transverse perforated pipe disposed contiguous to the lower end of the passage between the wall below the arch and the wall depending from the rear end of the arch and communicating at its ends with the atmosphere, and a combustion-flue communicating with the upper part of the shell.

4. In a furnace the combination of a shell, a substantially horizontal plate connecting the sides and front wall of the shell and terminating short of the rear wall thereof, a fire-pot disposed below said plate and communicating with the space above the same, an ash-pit below the fire-pot, an arch above the fire-pot and said plate and projecting rearwardly beyond the latter, a wall projecting from said plate rearward of the fire-pot and terminating short of the top of the arch and extending from side wall to side wall of the latter, a plate depending from the rear end of the arch to a point below the top of the wall below the arch, a transverse perforated pipe disposed contiguous to the lower end of the passage between the wall below the arch and the wall depending from the rear end of the arch and communicating at its ends with the atmosphere, a combustion-flue communicating with the upper part of the shell, tubes extending completely through the shell in a plane above the arch of the fire-pot, a casing fitting over the shell and partitioned into two portions one of which communicates with one end of the series of tubes and the other with the other end of the series of tubes, a cold-air-supply tube communicating with one of the partitioned portions of the casing, and discharge-tubes communicating with the other partitioned portion of the casing above said tubes.

812,790. **ELECTRIC-RAILWAY SYSTEM.** WILLIAM N. HARING, Nyack, N. Y. Continuation of abandoned application Serial No. 107,822, filed May 17, 1902. This application filed Oct. 31, 1903. Serial No. 179,379.

Claim.—1. In an electrical-railway system, a conduit constructed with walls provided with projections, a hollow body in said conduit and provided with flanges adapted to engage said projections to support the body, means to engage the flanges and projections to secure the body in applied position, a terminal contact mounted in said body, a feed-wire having connection with said contact, a contact movable in said body to engage said first-named contact, conductors carried by the last-named contact, and means to maintain said contacts normally separated.

2. In an electric-railway system, the combination of a conduit constructed with flanged walls, one of which is formed with a channel containing a feed-wire, a hollow body in the conduit provided with projecting portions seated upon the flanges of the walls, a contact in the hollow body connected to the feed-wire, a contact movable to engage said first-named contact and supporting a conductor, and means in the hollow body to hold the contacts normally separated.

3. In an electric-railway system, the combination of a rail having a channel therein and a flange, a feed-wire in the channel, hollow bodies provided with projecting portions seated upon said flange, a contact-terminal in said body connected to the feed-wire, a movable contact adapted to engage said contact-terminal, a conducting mem-

ber supported by the movable contact and means to maintain said contacts normally separated.

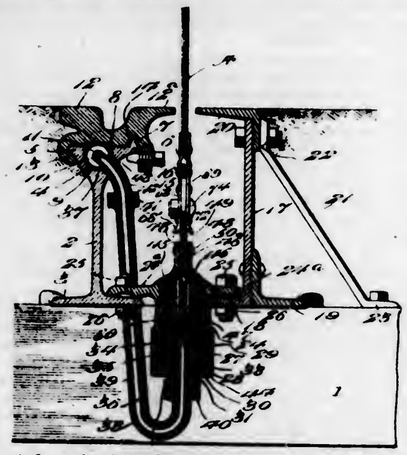
separated from the first-named contact by said block, and a conductor carried by the movable contacts.

11. In an electric-railway system, a conduit, hollow bodies ar-

electromagnet, said switch adapted to be held in position to close said circuit by said terminal valve, whereby said throttle-valve is held open by said electromagnet.

vided with an inlet and an outlet orifice, a terminal valve adapted to close said despatch-tube outlet-orifice, an ejector provided with an

ber supported by the movable contact and means to maintain said contacts normally separated.



4. In an electrical-railway system, a conduit constructed with walls provided with projections, a hollow body in said conduit and provided with flanges adapted to engage said projections to support the body, means to engage the flange and projections to secure the body in applied position, a resilient block arranged in the body and reduced intermediate its ends, a terminal contact carried by the body and projecting into an opening in the resilient block, a contact movable in said opening and adapted to be normally separated from the first-named contact by the resilient block, and a conductor carried by the last-named contact.

5. In an electric-railway system, the combination with a conduit, of hollow bodies arranged therein, a resilient block in each body reduced intermediate its ends, a cap-piece on the bottom of each hollow body, a terminal between the cap-piece and body and provided with a shank which projects into an opening in the resilient block, a vertically-moving contact projecting through the upper end portion of the block and carrying a conductor-rail and adapted to be moved into engagement with said shank.

6. In an electric-railway system, the combination with resilient supports of a sectional conductor, comprising a core provided with means to attach it to the supports and a conducting-jacket on the core.

7. In an electric-railway system, the combination with supports of a conductor, comprising a rigid core, provided with means to attach it to the supports, and a conducting-jacket on the core.

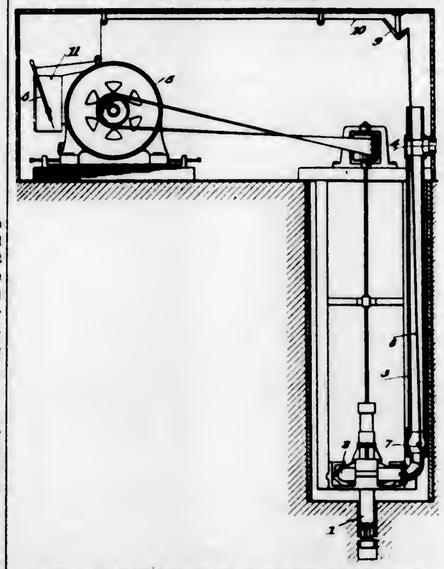
8. In an electric-railway system, the combination with supports of a rigid core-piece formed with depending portions engaging the supports and secured thereto, and a conducting-jacket on the core.

9. In an electric-railway system, the combination of a conduit, one wall of which is a traction-rail, having a channel and a detachable tread to close the channel, a feed-wire in said channel, hollow bodies supported in the conduit carrying contacts connected to the feed-wire, movable contacts carrying a conductor-rail, and adapted to be brought into engagement with the first-named contact, and means to hold said contacts normally separated.

10. In an electrical-railway system, a conduit constructed with walls provided with projections, one of said walls being formed with a channel containing a feed-wire, and a screw-threaded opening communicating with said channel, a hollow body in said conduit and provided with flanges to engage said projections, said body also having a screw-threaded portion, a cap-piece adjusted to engage the threaded portion of the body and provided with a depending exteriorly-threaded nipple, a resilient block arranged in the body and reduced intermediate its ends, a terminal plate arranged between the body cap-piece and provided with a contact extending into an opening in the resilient block, means for insulating the terminal plate and its contact, a pipe-section secured in said threaded opening and provided with a coupling, a coupling secured to said nipple, a pipe secured to said pipe-section and nipple by means of the coupling, a connecting-wire adapted to convey the current from the feed-wire to said contact and arranged in said pipe and pipe-section, a contact movable in the opening of the resilient block and adapted to be normally separated from the first-named contact by said block, and a conductor carried by the movable contacts.

11. In an electric-railway system, a conduit, hollow bodies arranged therein, a resilient block having a central opening throughout its entire length and mounted in each hollow body and reduced intermediate its ends, a contact projecting into the lower portion of the resilient block, a movable contact projecting into the upper portion of the resilient block and adapted to engage the first-named contact, said movable contact being normally held out of engagement with the first-named contact by the resiliency of the block and permitted to be brought into contact therewith by the resiliency of said block, and conductors carried by the said movable contacts.

812,791. **MOTOR-CONTROLLER.** WILEY H. HOUSTON, Santa Ana, Cal. Filed June 14, 1905. Serial No. 265,275.

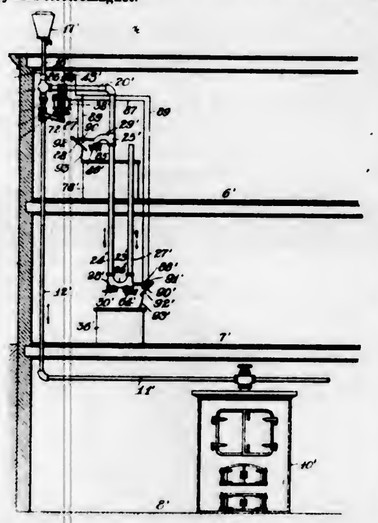


Claim.—1. In combination an electric motor; a pump having a delivery-pipe; a valve in the delivery-pipe adapted to check the downward flow of water therein; means for controlling the flow of the current to the motor: and means connecting said valve with said controlling means, whereby when the upward flow of the water in the delivery-pipe is stopped the valve closes and the current-controlling means cuts off the current to the motor.

2. In combination an electric motor; means for controlling the flow of the current to the motor; a pump having a delivery-pipe; a valve in the delivery-pipe adapted to check the downward flow of water therein; a bell-crank lever above the top of said delivery-pipe; a connecting-rod connecting one arm of said bell-crank lever to said valve: and a connection between the other arm of said bell-crank lever and the means controlling the flow of current to the motor whereby when the upward flow of the water in the delivery-pipe is stopped the valve closes and the current is cut off the motor.

812,792. **PNEUMATIC-DESPATCH-TUBE SYSTEM.** JOHN S. JACQUES, Dorchester, Mass. Original application filed May 24, 1905, Serial No. 262,263. Divided and this application filed Dec. 23, 1905. Serial No. 293,093.

Claim.—1. In a pneumatic-despatch-tube system, an ejector provided with an inlet and an outlet orifice, a despatch-tube provided with an inlet and an outlet orifice connected to said ejector intermediate said ejector inlet and outlet orifices, a terminal valve adapted to close said despatch-tube outlet-orifice, a receptacle adapted to contain steam, air or the like under pressure connected to the inlet-orifice of said ejector, a throttle-valve interposed between said ejector and receptacle and adapted to open or close communication therebetween, an electromagnet having an armature operatively connected to open or close said throttle-valve, a switch in electric circuit with said electromagnet, said switch adapted to be held in position to close said circuit by said terminal valve, whereby said throttle-valve is held open by said electromagnet, and means to operate said switch to break said circuit when said switch is released by said terminal valve, whereby said throttle-valve is released and allowed to close.



2. In a pneumatic-despatch-tube system, an ejector provided with an inlet and an outlet orifice, a despatch-tube provided with an inlet and an outlet orifice connected to said ejector intermediate said ejector inlet and outlet orifices, a terminal valve adapted to close said despatch-tube outlet-orifice, a receptacle adapted to contain steam, air or the like under pressure connected to the inlet-orifice of said ejector, a throttle-valve interposed between said ejector and receptacle and adapted to open or close communication therebetween, an electromagnet having an armature operatively connected to open or close said throttle-valve, a switch in electric circuit with said electromagnet, said switch adapted to be held in position to close said circuit by said terminal valve, whereby said throttle-valve is held open by said electromagnet, and means to operate said switch to break said circuit when said switch is released by said terminal valve, whereby said throttle-valve is released and allowed to close.

3. In a pneumatic-despatch-tube system, an ejector provided with an inlet and an outlet orifice, a despatch-tube provided with an inlet and an outlet orifice connected to said ejector intermediate said ejector inlet and outlet orifices, a terminal valve adapted to close said despatch-tube outlet-orifice, a receptacle adapted to contain steam, air or the like under pressure connected to the inlet-orifice of said ejector, a throttle-valve interposed between said ejector and receptacle and adapted to open or close communication therebetween, an electromagnet having an armature operatively connected to open or close said throttle-valve, and a switch in electric circuit with said electromagnet, said switch operatively connected to said terminal valve, whereby when said terminal valve is opened, said switch is operated to break said circuit and said throttle-valve closed.

4. In a pneumatic-despatch-tube system, a despatch-tube provided with an inlet and an outlet orifice, a terminal valve adapted to close said despatch-tube outlet-orifice an ejector provided with an inlet-orifice, an outlet-orifice and an intermediate orifice, said despatch-tube connected to said intermediate orifice, a receptacle for fluid under pressure connected to said ejector inlet-orifice, a shut-off valve interposed between said ejector and receptacle, and means to open and close said shut-off valve, said means controlled by said terminal valve.

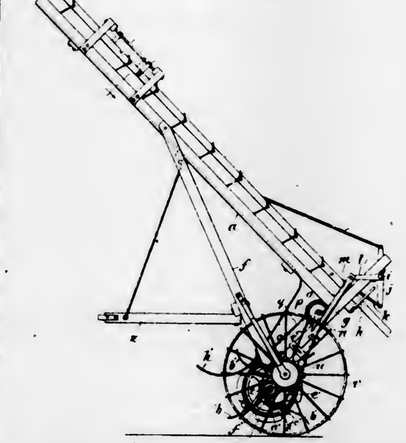
5. In a pneumatic-despatch-tube system, a despatch-tube provided with an inlet and an outlet orifice, a terminal valve adapted to close said despatch-tube outlet-orifice, an ejector provided with an inlet-orifice, an outlet-orifice and an intermediate orifice, said despatch-tube connected to said intermediate orifice, a receptacle for fluid under pressure connected to said ejector inlet-orifice, a shut-off valve interposed between said ejector and receptacle, and electrically-operated means to open said shut-off valve, said means controlled by said terminal valve.

6. In a pneumatic-despatch-tube system, a despatch-tube provided with an inlet and an outlet orifice, a terminal valve adapted to close said despatch-tube outlet-orifice, an ejector provided with an inlet-orifice, an outlet-orifice and an intermediate orifice, said despatch-tube connected to said intermediate orifice, a receptacle for fluid under pressure connected to said ejector inlet-orifice, a shut-off valve interposed between said ejector and receptacle, electrically-operated means to open said shut-off valve, said means controlled by said terminal valve, and a spring adapted to close said shut-off valve.

7. In a pneumatic-despatch-tube system, an ejector provided with an inlet and an outlet orifice, a transmission and a return tube, each of said tubes provided with an inlet and an outlet orifice, respectively, said tubes connected to said ejector intermediate said ejector inlet and outlet orifices, a terminal valve adapted to close each of said despatch-tube outlet-orifices, respectively, a connecting-tube joining said transmission and return tubes together, and means controlled by said terminal valves for causing a vacuum in said tubes.

8. In a pneumatic-despatch-tube system, an ejector provided with an inlet and an outlet orifice, a transmission and a return tube, each of said tubes provided with an inlet and an outlet orifice, respectively, one of said tubes connected to said ejector intermediate said ejector inlet and outlet orifices, a terminal valve adapted to close each of said despatch-tube outlet-orifices, respectively, a connecting-tube joining said transmission and return tubes together, a receptacle for fluid under pressure connected to said ejector inlet-orifice, an electromagnet, a shut-off valve interposed between said ejector and receptacle, and adapted to be operated by said electromagnet, and means controlled by each of said outlet terminal valves, respectively, to break the electric circuit of said magnet.

812,793. **HAY-LOADER.** EDWARD A. JOHNSTON, Sterling, Ill. Filed July 29, 1905. Serial No. 271,832.



Claim.—1. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a rotary gathering-cylinder having rake-teeth moving in a forward direction over the ground for taking the hay from the ground, and a conveyer between the deck and gathering-cylinder for delivering the hay to the rakes.

2. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a rotary gathering-cylinder having rake-teeth moving in a forward direction over the ground for taking the hay from the ground, a conveyer between the deck and the gathering-cylinder for delivering the hay to the rakes, and means operated by the traction-wheels for driving the gathering-cylinder, the conveyer and the rakes.

3. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a rotary gathering-cylinder for taking the hay from the ground, having a series of horizontal rake-heads provided with spring rake-teeth, the said teeth moving in a forward direction over the ground and a conveyer between the deck and the gathering-cylinder for delivering the hay to the rakes.

4. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a rotary gathering-cylinder for taking the hay from the ground, having a series of horizontal rake-heads provided with spring rake-teeth, crank-shafts upon which said rake-heads are hung, a cam for rocking said shafts to vary the inclination of the spring-teeth as the cylinder revolves, and a conveyer between the deck and the gathering-cylinder for delivering the hay to the rakes.

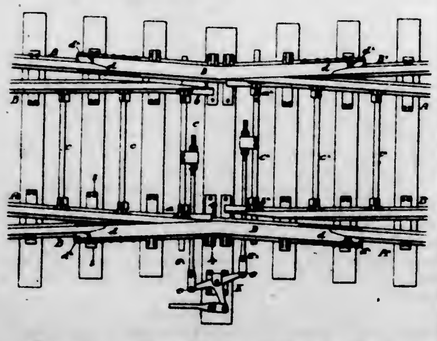
5. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a rotary gathering-cylinder for taking the hay from the ground, having a series of horizontal rake-heads provided with spring rake-teeth, crank-shafts upon which said rake-heads are hung, a cam for rocking said shafts to vary the inclination of the spring-teeth as the cylinder revolves, an endless conveyer having strand-wires passing over the gathering-cylinder between the spring-teeth, and cross-slats secured to said strand-wires, said conveyer serving to transfer the hay from the teeth of the gathering-cylinder to the rakes on the deck.

6. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, and a gathering-cylinder for taking the hay from the ground comprising rotary heads, crank-shafts between said heads, horizontal rake-heads on said shafts and having spring-teeth and a stationary cam coöperating with said shafts to rock the latter and thereby vary the inclination of the spring-teeth.

7. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a gathering-cylinder for taking the hay from the ground comprising rotary heads on said shafts and crank-shafts between said heads, horizontal rake-heads having spring-teeth and a stationary cam coöperating with said shafts to rock the latter and thereby vary the inclination of the spring-teeth, and a conveyer for delivering the hay from the gathering-cylinder to the rakes on the deck, said conveyer comprising sprocket-chains engaging the heads of the gatherer-cylinder, an idler-reel coöperating with said chains, strand-wires engaging the gatherer-cylinder and the idler-reel, and cross-slats attached to said strand-wires and the sprocket-chains.

8. In a hay-loader, an inclined deck, oppositely-reciprocating rakes operating over said deck, a gathering-cylinder for taking the hay from the ground comprising rotary heads on said shafts and crank-shafts between said heads, horizontal rake-heads having spring-teeth, and a stationary cam coöperating with said shafts to rock the latter and thereby vary the inclination of the spring-teeth, a conveyer for delivering the hay from the gathering-cylinder to the rakes on the deck, said conveyer comprising sprocket-chains engaging the heads of the gatherer-cylinder, an idler-reel coöperating with said chains, strand-wires engaging the gatherer-cylinder and the idler-reel, and cross-slats attached to said strand-wires and sprocket-chains, gearing connecting the traction-wheels with the gathering-cylinder for driving the latter and the conveyer, and means connecting the idler-reel with the rakes on the deck for reciprocating the latter.

812,794. **MOVABLE-POINT RAILWAY-CROSSING.** FRANK L. KEIM, Philadelphia, Pa., assignor to William Wharton, Jr., & Company, Incorporated, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Nov. 10, 1905. Serial No. 286,710.



Claim.—1. A movable-point railway-crossing having a stock-rail with an extension at each end forming a recess at each end for the reception of the respective adjoining track-rails, substantially as described.

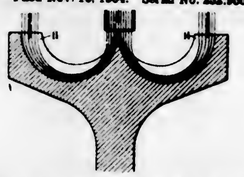
2. A movable-point railway-crossing having a stock-rail with a wide head and with an extension at each end forming a recess at each end for the reception of the respective adjoining track-rails, substantially as described.

3. A movable-point railway-crossing having a stock-rail made of hard metal with an extension at each end forming a recess at each end for the reception of the respective adjoining track-rails, substantially as described.

4. The combination in a movable-point railway-crossing, of hard-metal stock-rails shaped to the angle desired and recessed at the ends so as to be coupled in line with the adjoining rails of the track, with movable-point rails, and means for shifting said point-rails to and from the stock-rails, substantially as described.

5. The combination in a movable-point railway-crossing, of the track-rails, stock-rails one at each side of the track arranged to aline with the track-rails and shaped to the angle desired, movable-point rails, and means for shifting the said point-rails to and from the stock-rails, the said stock-rails having an extension at each end forming a recess at each end for the reception of the respective adjoining track-rails, the ends of said extensions being beveled, substantially as described.

812,795. **BUCKET FOR TURBINES.** HULDREICH KELLER, Berlin, Germany, assignor to General Electric Company, a Corporation of New York. Filed Nov. 16, 1904. Serial No. 232,960.

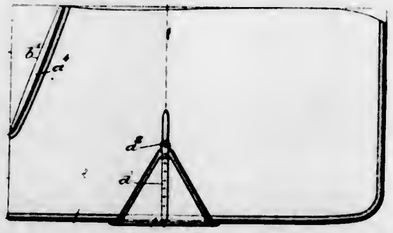


Claim.—1. An element for an elastic-fluid turbine containing a plurality of buckets and passages, each passage being substantially U-shaped in form and narrow at the inlet end with respect to the fluid stream, and wider at the discharge end than the fluid stream.

2. In a turbine, the combination of a nozzle, a bucket-carrying element arranged to receive fluid from the nozzle, the width of the wall on the inlet side of each bucket being less than on the discharge side, and pockets between the buckets which are substantially U-shaped in form and increase in width toward the discharge end.

3. In an elastic-fluid turbine, the combination of fluid-discharging means, an element situated in front of the said means which is provided with a double row of buckets and substantially U-shaped passages between the buckets, the walls forming said passages increasing in width from the inlet to the exhaust.

812,796. **HORSE-BLANKET.** ARTHUR H. KINDER, Boston, Mass., assignor to L. C. Chase & Company, Boston, Mass. Filed Nov. 19, 1904. Serial No. 233,406.



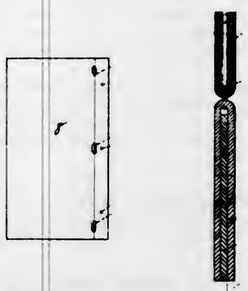
Claim.—1. The herein-described horse-blanket composed of blanket material, having a neck-opening and permanently closed below such opening to cover and protect the breast, one half of said blanket having permanently secured to it at its lower edge an overlapping piece, the free end of said piece being provided at a point beyond the edge of the blanket with a fastening, and a strap united at one end to the exterior of the other half of said blanket at a distance back from its edge, said strap engaging said fastening and holding the overlapping piece in position to overlap the lower edge of that half of the blanket to which said strap is attached and bring the edges of the blanket toward each other.

2. A horse-blanket composed of blanket material having permanently secured to one of its lower edges an overlapping piece of fibrous material triangular in shape, the free end of said overlapping piece being provided at a point beyond the edge of the blanket with a fastening, and a strap united at one end to the exterior of the other half of the said blanket at a distance back from its edge, said strap engaging said fastening and holding the overlapping piece in position to cross under the body of the horse, the end of the overlapping piece having the fastening overlapping the edge and part of the blanket to which the strap is attached, the strap in engagement with the fastening holding the edges of the blanket closed under the body of the horse and retaining the blanket in position.

812,797. **INSULATING ATTACHMENT FOR ELECTRIC FIXTURES.** ADOLPHUS A. KNUDSON, New York, N. Y., assignor of one-half to Frank H. Clark, Brooklyn, N. Y. Filed Mar. 8, 1905. Serial No. 249,110.

Claim.—An insulating-cover for a lamp-socket, consisting of a section of material substantially rectangular in form, said cover being adapted to be wrapped around the lamp-socket and to receive the key thereof between the adjacent edges of the cover, and means secured adjacent the edges of said cover at points above and below the key for drawing said cover taut about the socket, the upper end of said cover being gathered in to engage the small upper end of the socket.

812,798. **FOLDER AND BINDING.** EDWARD J. MEISENHEIMER, Milwaukee, Wis., assignor to Meisenheimer Printing Company, Milwaukee, Wis., a Corporation of Wisconsin. Filed Jan. 9, 1905. Serial No. 240,346.



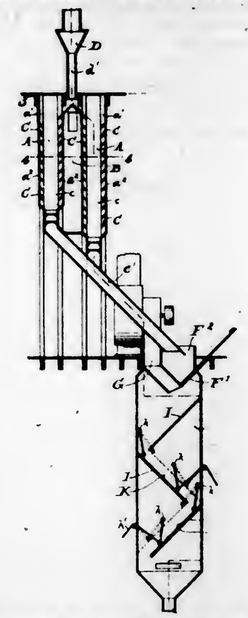
Claim.—1. As an article of manufacture, a folder, and a folded binding-strip flexibly attached to the folder, the folds being integrally united to each other.

2. As an article of manufacture, a folder, a folded binding-strip, and a filler, the folds being integrally united to each other through the filler.

812,799. **APPARATUS FOR CLEANING GRAINS.** HARVEY C. MILLER, Philadelphia, Pa. Original application filed June 18, 1904, Serial No. 213,114. Divided and this application filed Sept. 27, 1904. Serial No. 226,107.

Claim.—1. In an apparatus of the character and for the purpose described, in combination, a shaft, inclined shelves projecting from opposite sides thereof, a roughened plate adapted to overlie its corresponding shelf, said plate being supported so as to be movable to and from its corresponding shelf, and means to produce a current of air from the bottom to the top of said shaft.

2. In an apparatus of the character and for the purpose described, in combination, a shaft, inclined shelves projecting from opposite sides thereof, a roughened plate corresponding to one or more of said shelves, said plate being pivotally supported and adapted to rest upon and be moved away from its corresponding shelf, and means to produce a current of air from the bottom to top of said shaft.



3. In an apparatus of the character and for the purpose described, in combination, a shaft, inclined shelves projecting from opposite sides thereof, a roughened plate corresponding to one or more of said shelves, said plate being pivotally supported and adapted to rest upon and be moved away from its corresponding shelf, a device connected to said plate and passing through said shaft to manipulate said plate, and means to produce a current of air from the bottom to the top of said shaft.

4. In an apparatus of the character and for the purpose described, in combination, a shaft, inclined shelves projecting from opposite sides thereof, the lower end of the shelves projecting from one side being in line with the upper end of the shelf projecting from the opposite side, a roughened plate corresponding to one or more of said shelves, said plate being pivotally supported and adapted to rest upon and be moved away from its corresponding shelf, and means to produce a current of air from the bottom to the top of said shaft.

5. In an apparatus of the character and for the purpose described, in combination, a shaft, inclined shelves projecting from opposite sides thereof, the lower end of the shelves projecting from one side being in line with the upper end of the shelves projecting from the opposite side, a roughened plate corresponding to one or more of said shelves, said plate being pivotally supported and adapted to rest upon and be moved away from its corresponding shelf, a device connected to said plate and passing through the wall of said shaft to manipulate said plate, and means to produce a current of air from the bottom to top of said shaft.

6. In an apparatus of the character and for the purpose described, in combination, a shaft, inclined shelves projecting from opposite sides thereof, a roughened plate adapted to overlie its corresponding shelf, said plate being supported so as to be movable to and from its corresponding shelf, a device, exterior to the shaft, and connection between said device and the plate, whereby the plate may be moved from the exterior of the shaft to and from the shelf.

7. In an apparatus of the character and for the purpose described, in combination, a chamber having two opposite perforated walls, inclined shelves projecting at like angles from points on the opposite perforated sides at the same horizontal plane and terminating in the same horizontal plane, there being a space between the inner ends of corresponding shelves on opposite sides and means

to carry air through said chamber from side to side through said per-

to carry air through said chamber from side to side through said perforated walls.

8. In an apparatus of the character and for the purpose described, an apparatus comprising two chambers separated by a space, the longitudinal walls of each chamber being perforated, inclined shelves in each chamber projecting at like angles from points on the opposite perforated sides at the same horizontal plane and terminating in the same horizontal plane, there being a space between the inner ends of corresponding shelves on opposite sides, and a pressure or exhaust chamber intermediate of said two chambers.

812,800. **PAPER-CLIP.** JOHN MCLEAN, Newark, N. J. Filed Feb 16, 1905. Serial No. 245,895.

Claim.—1. A paper-clip comprising a disk having a marginal flange projecting from one side, and a tongue attached at one end to the disk within said flange, portions of the tongue projecting beyond the flanged side of the disk.

2. A paper-clasp comprising a circular disk having a marginal flange projecting from one side and a tongue projecting from the same side within the flange and free at the end.

3. A paper-clasp comprising a circular metal disk having an opening therethrough, a second disk united to the margin and covering one side of the first-named disk and its opening, and a tongue united to the first-named disk at one end of the opening and projecting from the opposite or back side of the first-named disk.

4. A paper-clasp comprising a metal disk having a marginal flange projecting from one side, and a tongue projecting from the same side as the flange, said tongue being stamped from the portion of the disk within the flange and forming an opening, and a celluloid or equivalent disk at the opposite side of the first-named disk and having its marginal edges united to said flange.

5. A clasp of the character described, consisting of a thin circular disk of spring metal having a portion thereof cut and pressed beyond one of its opposite faces for forming a spring-tongue which is free at one end and united at its opposite end to the main body of the disk, a second disk applied to the opposite face of the spring-metal disk and covering the opening formed by the stamping out of the tongue, and a third disk of celluloid or equivalent material applied to the outer face of the second disk and having its marginal edge crimped or turned over the marginal edges of said second-named disk and against the rear face of the spring-metal disk.

812,801. **ELECTRIC FURNACE.** JULIUS E. OBER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 15, 1904. Serial No. 216,675.

Claim.—1. In an electric furnace, a carbon tube, and a coating therefor formed of titanium carbid.

2. An electric furnace comprising a carbon tube heated by the passage of current through its wall, and a protective shell formed of titanium carbid.

3. In an electric furnace, a carbon tube, a layer of titanium carbid surrounding the tube, and a packing of coke surrounding the titanium carbid.

4. In an electric furnace, a tubular member formed of conducting material comprising two cylindrical end portions, and intermediate portions of reduced diameter.

5. In an electric furnace, a tubular member comprising two end portions and an intermediate portion of reduced diameter, and a protective sheath surrounding said reduced portion.

6. In an electric furnace, a tubular member comprising two end portions and an intermediate portion of reduced diameter, and a protective sheath surrounding said reduced portion, said protective sheath being formed of titanium carbid.

7. In an electric furnace, a tubular member comprising two end portions, and a reduced intermediate connecting portion, a packing of refractory non-oxidizable material formed with a passage in it of a diameter substantially the same as that of the end portions, and a mass of protective material located in the space between said refractory material and the reduced intermediate portion of the tubular member.

8. In an electric furnace, a tubular heating member, a sheath therefor of titanium carbid, and a packing of finely-divided, heat-resisting material surrounding said sheath.

9. In an electric furnace, a tubular heating member of carbon, and a sheath therefor consisting of a sintered mass of finely-divided titanium carbid.

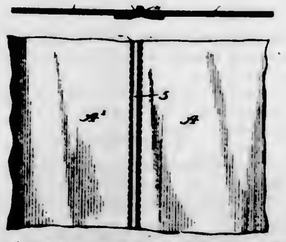
10. In an electric furnace comprising a carbon tube heated by the passage of current through it, a protective sheath for the tube formed of titanium carbid, and a mass of coke surrounding said sheath and the carbon tube inclosed thereby.

11. In an electric furnace, a carbon-tube heating member comprising end portions and an intermediate portion of reduced diameter, and a sheath for the reduced portion formed by wrapping paper about the heating member and then filling the space left between the paper and the reduced portion of the heating member with titanium carbid.

12. In an electric furnace, a heating member, and a protective sheath or coating therefor formed of non-hygroscopic carbid.

13. In an electric furnace, a heating member, and a protective sheath or coating therefor formed of a non-hygroscopic refractory carbid.

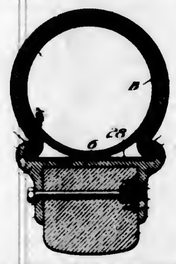
812,802. **SEAM FOR SEWED ARTICLES.** JAMES L. PATTERSON, Chicago, Ill., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed July 23, 1902. Serial No. 116,635.



Claim.—A seam composed of two fabrics having abutted folded edges, with a line of stitching uniting the same at the fold, one of said fabrics being provided with a rib or ridge, pressed up out of the body of the fabric, and lines of stitching passed down upon the opposite sides of said rib or ridge, with locking-threads for securing the lines of stitching together on the under side, thus permanently fixing said rib or ridge; substantially as described.

REISSUES.

12,450. **RIM FOR RUBBER-TIRED WHEELS.** ORSON L. PICKARD, Toledo, Ohio. Filed Nov. 25, 1905. Serial No. 289,354. Original No. 771,445, dated Oct. 4, 1904.



Claim.—1. In a vehicle-wheel, a rim having a body portion divided circumferentially into two parallel abutting sections which interlock in the direction of rotation, and means for preventing independent rotation of said rim-sections, substantially as described.

2. In a vehicle-wheel, a rim having a body portion divided circumferentially into two sections provided respectively with recesses and engaging plates which interlock in the direction of rotation, and means for preventing independent rotation of said rim-sections, substantially as described.

3. In a vehicle-wheel, a rim having a body portion divided circumferentially into two parallel abutting sections which interlock in the direction of rotation, of opposing side tire-retaining flanges integral with said rim-sections, and means for preventing independent rotation of the rim-sections, substantially as described.

4. In a vehicle-wheel, a rim having a body portion divided circumferentially into two parallel abutting sections which interlock and are drawn together by relative rotation, and means for preventing independent rotation of said rim-sections, substantially as described.

5. In a vehicle-wheel, a rim having a body portion divided circumferentially into two parallel abutting sections which interlock and are drawn together by relative rotation, and a bolt for preventing independent rotation of said rim-sections, substantially as described.

6. In a vehicle-wheel, the combination with a felly, of a rim having a body portion divided circumferentially into two sections provided respectively with recesses and projecting plates which interlock and are drawn together by relative rotation, and a bolt for preventing independent rotation of said rim-sections, substantially as described.

7. In a vehicle-wheel, the combination with a felly, of a rim having a body portion divided circumferentially into two sections which interlock and are drawn together by relative rotation, side flanges upon said sections for embracing the felly, and a through-bolt for preventing independent rotation of said flanges and felly, substantially as described.

8. In a vehicle-wheel, the combination with a felly, of a rim divided circumferentially into two sections provided respectively with recesses and projecting plates which interlock in the direction of rotation said plates having inclined engaging surfaces for drawing said sections together, and means for preventing independent rotation of said rim-sections, substantially as described.

9. In a vehicle-wheel, the combination with a felly, of a rim divided circumferentially into two sections one fixed and the other removable with relation to the felly, cooperating recesses and projecting plates upon said rim-sections which interlock in the direction of rotation, a bolt for preventing independent rotation of said rim-sections and felly, and a socket-plate recessed into the felly and forming a bushing for the said locking-bolt, substantially as described.

10. In a vehicle-wheel, the combination with a felly and tire, of a rim divided circumferentially into two sections which interlock in the direction of rotation, a bolt for preventing independent rotation of said rim-sections, and a tire-protecting ring surrounding said rim-sections, substantially as described.

12,451. **GARMENT-HOOK.** RUTHERFORD C. HAVEN, Trenton, N. J., assignee of William H. Hippisley, deceased. Filed July 31, 1905. Serial No. 270,734. Original No. 774,426, dated Nov. 8, 1904.

Claim.—1. A hook of the character described, comprising side arms, each carrying at one end an eye and spread apart or diverged at their opposite ends to form a receiving-space and terminating in a bill lying parallel with said side arms, and a tongue lying between said arms and having a hump intermediate its ends projecting toward said bill and formed with an angular attaching-eye which lies in said receiving-space between and approximately within the plane of said divergent or spread-apart ends of the arms, substantially as described.

2. A hook of the character described, comprising side arms, each carrying at one end an eye, and spread apart or diverged at their opposite ends, forming a receiving-space and terminating in a bill lying parallel with said side arms, and a tongue lying between said arms and formed with an attaching-eye, which lies in said receiving-space between and approximately within the plane of said divergent or spread-apart ends of the arms.

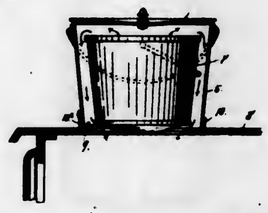
3. A hook of the character described, formed from a single piece of wire and comprising side arms, the wire from each of the arms formed at one end with an eye, said arms being spread apart or diverged at their opposite ends, forming a receiving-space and terminating in a bill, and said wire extending from the portion forming one of said eyes into a tongue lying between said arms, said tongue ending in an attaching-eye which lies in said receiving-space between and approximately within the plane of said divergent or spread-apart ends of the arms.

4. A garment-hook having means of attachment at one end, arms bent upon themselves for forming a bill, the bend being at the other end of the hook and the arms at and adjacent to the bend being bent laterally and spread apart forming a space, and means of attachment in the said space.

5. A garment-hook having an eye at one end, arms bent upon themselves for forming a bill, the bend being at the other end of the hook, and the arms at and adjacent to the bend being laterally divergent and spread apart forming a space, and an eye in the said space.

6. A garment-hook having eyes at one end, side arms laterally spread apart or diverged at the other end of the hook forming a receiving-space, said arms terminating in a bill, and a tongue lying between said arms and formed with an attaching-eye normally lying in said receiving-space between and approximately within the plane of said divergent or spread-apart ends of the arms.

12,452. **COOKING UTENSIL.** JAMES F. FERRY, Leadville, Colo. Filed June 30, 1904. Serial No. 214,770. Original No. 711,841, dated Oct. 21, 1902.



Claim.—1. In a cooking utensil, a casing adapted to receive a cooking vessel, a cover for said casing and entirely closing the top thereof, the casing being open at the bottom, and lugs extended inward at the bottom and secured to the outer side of the casing, the lower surfaces of said lugs being on a plane with the bottom edge of the casing, substantially as specified.

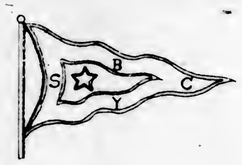
2. In a cooking utensil, a casing adapted to receive a cooking vessel, a cover for said casing, the casing being open at the bottom and lugs extended inwardly from the casing at the bottom, the lower surfaces of said lugs being in a plane with the bottom edge of the casing.

3. In a cooking utensil, a casing adapted to receive a

3. In a cooking utensil, a casing adapted to receive the cooking vessel, said casing being open at the bottom, a cover for the casing, a ring secured to the outer side of the casing at the bottom, and lugs extended inwardly from said ring, the bottom of the casing being provided with recesses to receive said lugs.

DESIGNS.

37,817. BADGE. RICHARD A. PORTER, Patchogue, N. Y. Filed Aug. 9, 1905. Serial No. 273,484. Term of patent 3½ years.



Claim.—The ornamental design for a badge, as shown.

37,818. BRACELET. JOHN BENNETT, Attleboro, Mass., assignor to Electric Chain Company, a Corporation of Maine. Filed Dec. 20, 1905. Serial No. 292,673. Term of patent 3½ years.

Claim.—The ornamental design for a bracelet, as shown.

37,819. TOILET-POWDER RECEPTACLE. WILLIAM A. BRADLEY, New York, N. Y. Filed Dec. 29, 1905. Serial No. 293,865. Term of patent 7 years.

Claim.—The ornamental design for a toilet-powder receptacle as shown.

37,820. BOTTLE. MAURICE CHASTENET, Bordeaux, France, assignor to Chastenet Frères, Bordeaux, France. Filed Oct. 11, 1905. Serial No. 282,345. Term of patent 14 years.

Claim.—The ornamental design for a bottle, as shown.

37,821. GLASS DISH. JOSEPH M. MCMAHON, Brackenridge, Pa., assignor to Tarentum Glass Company, Tarentum, Pa., a Corporation of Pennsylvania. Filed Oct. 30, 1905. Serial No. 285,191. Term of patent 3½ years.

Claim.—The ornamental design for a glass dish, as shown.

37,822. PREMIUM-STAMP. JOSEPH ALBERT JOSEPHA, Flushing, N. Y. Filed Apr. 22, 1905. Serial No. 257,094. Term of patent 7 years

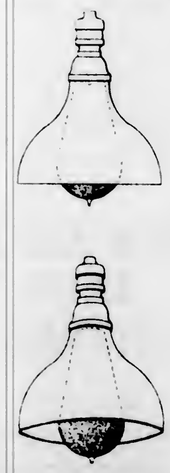
37,822.

Claim.—The ornamental design for a premium-stamp, as shown.

37,823. ILLUMINATED CHANDELIER-SIGN. JOHN L. DAWES, Pittsburg, Pa. Filed Dec. 18, 1905. Serial No. 292,384. Term of patent 3½ years.

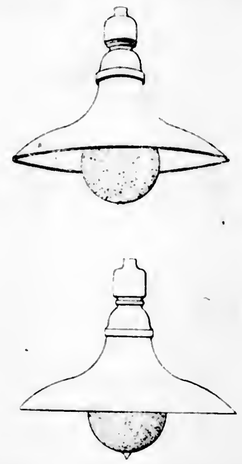
Claim.—The ornamental design for an illuminated chandelier-sign, as shown.

37,824. ILLUMINATOR. OTIS A. MYGATT, New York, N. Y. Filed July 14, 1905. Serial No. 269,733. Term of patent 14 years.



Claim.—The ornamental design for an illuminator as shown and described.

37,825. ILLUMINATOR. OTIS A. MYGATT, New York, N. Y. Filed July 14, 1905. Serial No. 269,735. Term of patent 14 years.

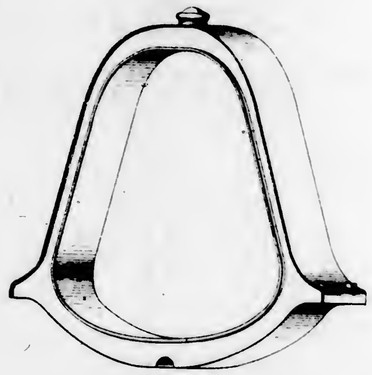


Claim.—The ornamental design for an illuminator, as shown and described.

37,826. CUTTER-LEVER HANDLE. HENRY K. PORTER, Chelsea, Mass. Filed Sept. 14, 1905. Serial No. 278,594. Term of patent 14 years.

Claim.—The ornamental design for a cutter-lever handle, as shown.

87,827. FRAME OF RADIATORS FOR AUTOMOBILES. LINDLEY D. HUSSELL, Hartford, Conn. Filed July 24, 1905. Serial No. 271,111. Term of patent 14 years.



Claim.—The ornamental design for a frame of a radiator for automobiles as shown.

87,828. RUG. FRANK A. HAAS, New York, N. Y., assignor to Matthew J. Whittall, Worcester, Mass. Filed Dec. 27, 1905. Serial No. 293,530. Term of patent 3½ years.

Claim.—The ornamental design for a rug as shown.

TRADE-MARKS

PUBLISHED FEBRUARY 13, 1906.

The following trade-marks have been adjudged entitled to registration under the act of February 20, 1905, and are published in compliance with section 6 of said act. Said section provides:

"Any person who believes he would be damaged by the registration of a mark may oppose the same by filing notice of opposition, stating the grounds therefor, in the Patent Office within thirty days after the publication of the mark sought to be registered, which said notice of opposition shall be verified by the person filing the same before one of the officers mentioned in section two of this act. If no notice of opposition is filed within said time the Commissioner shall issue a certificate of registration therefor, as hereinafter provided for."

Marks which are stated to have been "Used ten years" are registrable under the last proviso of section 5 of said act, which is as follows:

"And provided further, That nothing herein shall prevent the registration of any mark used by the applicant or his predecessors, or by those from whom title to the mark is derived, in commerce with foreign nations or among the several States, or with Indian tribes, which was in actual and exclusive use as a trade-mark of the applicant or his predecessors from whom he derived title for ten years next preceding the passage of this act."

Section 14 of said act provides for the following fee:

"On filing notice of opposition to the registration of a trade-mark, ten dollars."

SER. No. 249. WHISKY. W. H. JONES AND CO., Boston, Mass. Filed Apr. 3, 1905.

ELM HILL

The words "ELM HILL."

SER. No. 689. ANTIFOULING COMPOSITIONS FOR THE BOTTOMS OF STEEL AND IRON SHIPS. GEORGE H. GARDINER & SON, New York, N. Y. Filed Apr. 6, 1905. Used ten years.

AMERICAN McINNES ANTI-FOULING COMPOSITION.

The words "AMERICAN MC INNES ANTI-FOULING COMPOSITION."

SER. No. 731. CANDIES, CHOCOLATES, AND BONBONS. D. AUERBACH & SONS, New York, N. Y. Filed Apr. 7, 1905.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE CALDWELL AND BARR.

Decided December 21, 1905.

1. ALTERNATIVE CLAIMS.

A claim should not be drawn in an alternative form even where the alternative elements are equivalents, but should use some broad term of description which will include both forms.

2. SAME—INDEFINITE CLAIM.

A claim including a description of an element as "brick or the like" is alternative in form and is indefinite, since the word "like" fails to identify the characteristics of the substance.

ON PETITION.

GRAIN-BLEACHER.

Messrs. Raymond & Barnett for the applicants.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner objecting to claims 2 and 3 as alternative in form.

Claim 2 includes "a mixing-compartment containing a quantity of coke or the like," and claim 3 includes "a casing containing a mass of coke, brick, or like material." The Examiner regards the terms "coke or the like" and "coke, brick, or like material" as alternative rather than generic and has required amendment.

In his brief counsel for the petitioner states that the terms were used in the effort to define a material which—

for the purposes of applicants' structure and operation, possesses the same qualities as coke, broken brick, "and the like," *i. e.*, broken, irregular, absorbent, and more or less refractory material, which will readily retain moisture, allow the free passage of moisture and of gases through a body of such material, and afford a large surface exposure.

It is always objectionable to use in the claim words of description which are alternative in form, and this is true even where it appears from consideration of the whole case that the words are not intended to convey alternative or inconsistent ideas. Where possible, some terms of description should be used which are generic, so defining the field sought to be covered as to include all of the specific forms coming within it without specifically mentioning the various forms sought to be included.

Specific mention of the various alternative elements is objectionable, and the mention of one coupled with the words "or the like" is also objectionable for the same reasons. The words "brick or the like" do not in and of themselves convey any definite idea of the field sought to be covered. Broken brick may be like coke for some purposes; but it is clear that it is not like coke for all purposes. If it can be described as "like" for some particular purpose, it must be because of certain common characteristics. The applicants must know what those common characteristics are and must state them in the application; otherwise they furnish no guide for determining what is meant by the term "like." There seems to be no good reason, therefore, why the applicants should not in their claims identify the substance used by a statement of the characteristics necessary. The words "brick or the like" are not a broad statement of the characteristics, but are alternative in form and indefinite in substance.

The petition is denied.

THE BUCHANAN-ANDERSON-NELSON COMPANY *v.* BREEN & KENNEDY.

Decided December 21, 1905.

TRADE-MARK OPPOSITION—"HENDERSON" NOT REFUSED ON "ANDERSON."

A trade-mark including the word "Henderson" is not to be refused registration because an entirely different mark including the word "Anderson" had been used previously by another upon the same class of goods.

APPEAL from Examiner of Interferences.

TRADE-MARK FOR WHISKY.

Mr. Jas. L. Hopkins and *Mr. John S. Barker* for the Buchanan-Anderson-Nelson Company.

Mr. Arthur E. Wallace for Breen & Kennedy.

ALLEN, *Commissioner:*

This is an appeal by Buchanan-Anderson-Nelson Company from the decision of the Examiner of Interferences dismissing its notice of opposition to the registration of a trade-mark by Breen & Kennedy.

The applicants' mark is used on whisky and is described as follows:

The word "Henderson" on a ribbon design, beneath which is a shield upon which is the monogram "B & K."

The Buchanan-Anderson-Nelson Company opposed registration on the ground that the mark so nearly resembles a mark owned and used by it upon the same class of goods as to cause confusion and mislead purchasers. Its mark is described in the notice of opposition as follows:

The trade-mark consists of the representation of a Maltese or Templar cross and a panel below the same bearing the word "Anderson" in white letters, the cross and panel appearing in red and each having a border in gold, as shown in the accompanying facsimile. This may be arranged in connection with any suitable descriptive matter without materially altering the character of the trade-mark, the essential feature of which is the representation of a Maltese or Templar cross and a panel below the same and bearing the word "Anderson" in white letters, the cross and panel appearing in red and each having a border in gold.

This mark was registered December 29, 1896, No. 29,373. It appears from consideration of the marks themselves and from the argument made by the appellant that the only possible question as to confusion between the

marks arises from the use of the names "Anderson" and "Henderson." All other features of the marks are so entirely dissimilar as to furnish no possible basis for confusion. In its brief before the Examiner the appellant said:

The solitary question presented upon this point is whether or not the resemblance between the two words "Henderson" and "Anderson" is calculated to deceive and to mislead the public into purchasing and consuming Breen & Kennedy's whisky under the false belief that it is the whisky of the Buchanan-Anderson-Nelson Company.

A mere inspection of the applicants' mark shows that there was no effort to copy or simulate the appellant's mark, since, as above stated, there is not even an allegation of similarity except as to the names Anderson and Henderson. Those names are both well known, and it is believed that there is no likelihood that purchasers will assume that the word "Anderson" indicates the same party or owner as the word "Henderson." On the contrary, it is believed that they will know at once that the parties are different.

The decision of the Examiner of Interferences dismissing the notice of opposition is affirmed.

WINAND v. THE P. J. DRURY COMPANY.

Decided December 22, 1905.

1. TRADE-MARK—OPPOSITION FILED TOO LATE—OFFICE WITHOUT JURISDICTION.

This Office has no authority to entertain a notice of opposition to the registration of a trade-mark filed more than thirty days after the publication of the mark.

2. SAME—OPPOSITION TO REGISTERED MARK—MOOT QUESTION.

Where opposition is made to the registration of a mark and it appears that the mark has been registered, the opposition will be dismissed as raising a moot question.

ON APPEAL.

TRADE-MARK FOR WHISKY.

Mr. Arthur E. Wallace for Winand.

Mr. J. Nota McGill for The P. J. Drury Company.

ALLEN, *Commissioner:*

This is an appeal by J. P. Winand from the decision of the Examiner of Interferences dismissing his notice of opposition to the registration of a trade-mark by The P. J. Drury Company.

It appears that the applicant's trade-mark was published in the OFFICIAL GAZETTE of May 16, 1905, and that no notice of opposition was filed within thirty days thereafter, as provided in section 6 of the Trade-Mark Act; but on July 6 J. P. Winand filed the notice of opposition which is here under consideration. At the time the notice was received the application had been passed to issue and was in the hands of the printer. On July 11, 1905, the mark was actually registered.

It appears that this Office did not notice that the mark was registered, and the applicant did not call attention to the fact, and therefore on August 8 the applicant was called upon to file an answer to the notice of opposition. Such answer was filed on September 8, and thereafter times were set for taking testimony. The present attorney for The P. J. Drury Company was then appointed and took charge of the prosecution of the case, and on October 11 he filed a motion to dismiss the opposition. That motion was granted, and thereupon this appeal was filed.

It is to be noted that section 6 of the Trade-Mark Act providing for opposition distinctly says that if no opposition is filed within the thirty days allowed registration shall be granted to the applicant. The statute gives this Office no authority to extend the time fixed for opposition and therefore it is without jurisdiction to conduct proceedings on an opposition filed after that date. The Examiner was therefore right in dismissing the opposition upon this ground. In the present case, furthermore, since the trade-mark has been registered by the applicant, proceedings in opposition to that registration are clearly of no effect and useless. The sole purpose of the opposition was to prevent registration, and it is very clear that such result cannot be effected now even if it should be concluded that the mark should not have been registered.

The decision of the Examiner of Interferences is affirmed.

AUTENRIETH AND KANE v. SORENSEN.

Decided December 22, 1905.

APPEAL AFTER EXPIRATION OF LIMIT OF APPEAL—VERIFIED SHOWING.

A petition to extend the limit of appeal to include an appeal filed after the expiration thereof must be supported by a verified showing in excuse for the delay. (*Ex parte Kletzker and Goesel* v. *Dodson*, 109 O. G., 1336.)

ON PETITION.

SNAP-SWITCH.

Mr. Vernon E. Hodges for Autenrieth and Kane.

Messrs. Townsend & Decker and *Mr. J. R. Edson* for Sorensen.

ALLEN, *Commissioner:*

This is a petition by Autenrieth and Kane that the limit of appeal to the Examiners-in-Chief which expired on November 4, 1905, be extended to include an appeal filed November 6, 1905.

Since the showing made in support of the petition is not verified, as required by the practice indicated in the case of *Kletzker and Goesel* v. *Dodson* (109 O. G., 1336) and other decisions, the petition is dismissed.

EX PARTE JANSSON.

Decided December 22, 1905.

1. DESCRIPTION — REFERENCE TO MODIFICATIONS — CANCELLATION NOT REQUIRED.

Where the applicant states in his specification that he does not regard his invention as limited to the exact details of construction and it appears that his claims are not so limited, *Held* that he should not be required to cancel the statement as superfluous. (*Ex parte Champ*, 114 O. G., 1827, distinguished.)

2. SAME—SCOPE OF CLAIMS—INTENT OF APPLICANT MATERIAL.

In a case of doubt the intent of the applicant in using a term in a claim and the understanding of the Office in allowing the claim have a material bearing upon its meaning and scope, and therefore the applicant should not be required to cancel statements where such cancellation may result in a more limited construction of the claim than is necessary.

ON PETITION.

AUTOMATIC STOP MOTION APPARATUS.

Messrs. Brown, Darby & Hopkins and *Mr. Chas. M. Nissen* for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner requiring the cancellation of the following statement in the specification on the ground that it is superfluous:

I wish it to be understood that I do not desire to be limited to the exact details of construction shown and described, for obvious modifications will occur to a person skilled in the art.

It does not appear from the Examiner's statement that the claims are, in fact, limited to the exact details of con-

struction shown and described, and therefore no question as to the accuracy of the above-quoted statement has been raised. The sole objection is that the statement is unnecessary and serves no useful purpose in the application.

While it is true that it may be determined without reference to the above-quoted statement whether or not the claims are limited to the exact details of construction, it is also true that the meaning to be given to terms used in the claims is often controlled by the proceedings in this Office which show the intent. In case of doubt as to the meaning of any term, the intent of the applicant in using the term and the understanding of this Office in allowing the claim become material. The intention of the parties is just as important in construing a patent as in construing any other legal instrument, and for that reason the courts give great weight to the proceedings in this Office leading to the grant.

In the present case the paragraph to which objection has been made was clearly inserted to show that the applicant used the terms found in the claims in their broad and not their restricted sense. To cancel that paragraph upon the requirement of this Office might lead to the conclusion that the applicant acquiesces in a ruling by this Office that the terms of the claims are to be understood in a restricted sence. While it was not necessary to include the statement, it does not tend to mislead or confuse the public as to the meaning of the patent, but, on the contrary, tends to make clear the meaning. It is not mere surplusage, since it discloses the intent, which has a material bearing upon the meaning of the claims.

This case is to be distinguished from that considered in *ex parte Champ*, (114 O. G., 1827.) In that case the applicant merely stated well-known principles of law applicable to his case, as well as to all other cases, and included nothing of value in determining the scope and meaning of the patent. There is no limit to the propositions of law which might be stated in patents, and since their inclusion is useless it was pointed out in *ex parte Champ* that they should be excluded.

The petition is granted.

KINSMAN v. STROHM.

Decided January 3, 1906.

ABANDONMENT OF APPLICATION—REVIEW OF FORMER COMMISSIONER'S DECISION—ALLEGATION OF FRAUD BY APPLICANT.

The question of abandonment of an application decided by a former Commissioner will not be reviewed except upon a clear and satisfactory showing that the Commissioner was misled by the applicant as to the facts, and mere *ex parte* affidavits cannot be regarded as such showing.

ON PETITION.

RAILWAY SIGNALING.

Mr. Charles S. Champion for Kinsman.

Messrs. Connolly Bros. for Strohm.

ALLEN, *Commissioner:*

This is a petition by Kinsman referring to a motion for dissolution and a motion to shift the burden of proof made by him and asking for a review and reversal of a ruling made in 1899 to the effect that Strohm's application was not abandoned for lack of prosecution.

It appears that more than two years elapsed without action by the applicant in Strohm's case, and therefore it was *prima facie* abandoned. The applicant, however, filed affidavits tending to show poverty and illness on the part of the applicant such as made the delay unavoidable. In view thereof Commissioner Duell granted a petition asking for a review of the facts and an adjudication that the case was not abandoned.

The present petitioner alleges that there was no foundation in fact for the allegations upon which the petition was granted and that this Office was misled by the applicant Strohm.

The action of my predecessor upon the question of abandonment will not be reviewed except upon a clear showing that he was misled as to the facts by the affidavits filed. The *ex parte* affidavits now filed cannot be accepted as such showing. They are opposed by the affidavits originally filed on behalf of Strohm, and there is no reason for accepting them as having greater force.

The present petition must be denied; but it may be said that if the evidence taken in the interference, where Strohm has the right of cross-examination, shows that the allegations made in the affidavits which lead to the holding that the case was not abandoned were contrary to the facts the matter may be reconsidered.

The petition is denied.

EX PARTE SCHRADER.

Decided January 9, 1906.

FINAL REJECTION—AMENDMENT AFTER—SHOWING REQUIRED.

The statement of the attorney that the subject-matter of a proposed amendment filed after final rejection was not earlier called to his attention by the inventor is not a sufficient showing upon which to admit the amendment.

ON PETITION.

STOPPERS FOR WATER-BAGS.

Messrs. Arthur C. Fraser & Co. for the applicant.

ALLEN, *Commissioner:*

This is a petition requesting that the above-entitled case be reopened for the admission of an amendment erasing all the claims and substituting a new one in place thereof.

It appears that all the claims in the case were finally rejected by the Examiner and that such rejection was affirmed upon appeals to the Examiners-in-Chief and to myself. The only showing made why the amendment was not earlier presented is the statement of the attorneys that the subject-matter of the new claim was not called to their attention by the inventor, who was in Europe at the time the application was prepared. The showing is insufficient.

The petition is denied.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

PODLESAK AND PODLESAK v. MCINNERNEY.

Decided January 4, 1906.

1. INTERFERENCE—UNSUPPORTED TESTIMONY OF JOINT INVENTORS.

Where the only testimony taken by joint inventors upon the question of the date of their invention is their own depositions, *Held* that the depositions of parties to interference upon this point, unless corroborated by independent circumstances established by the evidence, are clearly insufficient to prove conception of the invention. (*Garrells* v. *Freeman*, 21 App. D. C., 207.)

2. SAME—ORIGINALITY.

Where a party contended that he communicated the invention to his opponent, but did not claim to have made complete

12. SAME—CASE REMANDED UNDECIDED—FURTHER CONSIDERATION BY COURT.

In remanding the interference to the Patent Office undecided

Under this authority the Primary Examiner considered the right of McInnerney to make the claims constituting

would not have been delivered until October 30, 1899, for the 29th was Sunday. We think the proof offered is not

2. SAME—ORIGINALITY.

Where a party contended that he communicated the invention to his opponent, but did not claim to have made complete disclosure, and the circumstances did not support the theory of derivation, *Held* that the rule of *Winslow* v. *Austin* (14 App. D. C., 137) that the failure of a party to rebut the sworn statement of his adversary that he had fully disclosed the invention to him furnished strong evidence that the latter was not the prior inventor did not apply.

3. SAME—PRIORITY.

Held that the Commissioner of Patents having found there was an interference in fact and that McInnerney had the right to make the claim could come to no other conclusion upon the proofs and the law applicable thereto than the one he did, and consequently his award of priority is correct if the remaining questions be decided in McInnerney's favor.

4. SAME—RIGHT TO MAKE CLAIMS AND INTERFERENCE IN FACT—CONCURRENT DECISIONS IN PATENT OFFICE ORDINARILY CONCLUSIVE.

Where a question of interference in fact or right to make claims has been fully considered by the Primary Examiner, the Examiners-in-Chief, and the Commissioner and all have concurred in finding that a party to an interference has the right to make a claim which is the same as the count of the issue of an interference, *Held* that these conclusions will ordinarily be considered by the court as conclusive.

5. SAME—RIGHT TO CLAIM—EFFECT OF INCORRECT DECISION.

If it be incorrectly held that a party to an interference has a right to make a claim in issue, an award of priority to him is made possible. His adversary would thereby be deprived of a substantial right in that he would be refused a claim where he was necessarily the prior inventor, his adversary never having made the invention.

6. SAME—SAME—DECISION OF PRIMARY EXAMINER NOT FINAL—CONSIDERATION BY COURT OF APPEALS.

In view of the possible effect upon the determination of priority of an error in a decision holding that a party has a right to make a claim, *Held* that the latter question should not be finally determined by the Primary Examiner who originally declared the interference and that the court would therefore take jurisdiction to determine that question as ancillary to that of priority.

7. SAME—SAME LANGUAGE AND DIFFERENT INVENTIONS.

General terms may be used which apply equally to two structures which are not the same, as may be shown when those terms are read and construed in the light of the specifications behind them; but in most cases where two structures are not specifically the same and the art does not warrant a generic claim the language of the claims can be made precise and to fittingly describe each structure so that the use of identical language be avoided.

8. SAME—SAME—AMENDMENT NECESSARY.

Where the claim read in the light of the specification of one party means one thing and the same claim read in the light of the specification of another party means another thing, *Held* that the same phraseology should not be employed.

9. SAME—INTERPRETATION OF ISSUE.

The meaning given to the counts of an interference must be that intended by the party to the interference first making the claim. (*Tracy* v. *Leslie*, 14 App. D. C., 126; *Ruete* v. *Elwell*, 15 App. D. C., 21.)

10. SAME—CONSTRUED ISSUE—INAPPLICABLE TO CASES OF BOTH PARTIES—CASE REFERRED TO PATENT OFFICE UNDECIDED.

Where the issue if broadly construed read upon the devices of both parties, but consisted of a claim which had been allowed over a reference only upon a narrow construction inapplicable to the devices of one party, and it appeared that such construction of the claims was necessary in order to sustain the same, *Held* that, in the opinion of the court, an error had been committed and that the case should be remanded undecided to the Patent Office for further consideration as to identity of invention.

11. SAME—NO INTERFERENCE IN FACT—RE-FORMATION OF CLAIMS IN ISSUE.

Held that apparently neither party is entitled to a claim for the feature in controversy which should dominate the other and that apparently the claims presented by both and made the issue should be so re-formed that each should have a specific claim, provided each could draw one to avoid the reference.

12. SAME—CASE REMANDED UNDECIDED—FURTHER CONSIDERATION BY COURT.

In remanding the interference to the Patent Office undecided for further consideration of the question of identity of invention, *Held* that if after such consideration the Office adheres to the opinion that there is an interference in fact the present interference record with any additions will be further considered by the court.

Mr. C. Le Roy Parker for the appellants.

Mr. J. C. Pennie and *Mr. Jas. T. Williamson* for the appellee.

DUELL, *J.*:

This appeal is taken from the decision of the Commissioner of Patents awarding priority of invention to McInnerney.

Appellants assign as errors the findings of the Commissioner that McInnerney was the prior inventor; that there is an interference in fact between the inventions of the interferants; and that McInnerney has a right to make the claim which constitutes count 2 of the issue.

The record discloses that when the interference was declared there were three counts. After the testimony had been taken the case was remanded to the Primary Examiner to consider McInnerney's right to make the claim constituting the third count of the issue. It was decided that he had no right to make the claim. This left the interference with two counts. Thereafter at the request of the Primary Examiner the interference proceedings were again suspended and the papers transmitted to the Primary Examiner to consider a newly-discovered reference. The Examiner decided that the claims constituting the remaining counts were anticipated by a patent to one Tirrell, No. 230,589, July 27, 1880. From this decision an appeal was taken to the Examiners-in-Chief, who held that when the claims were "construed by the specification behind them they were patentable over the reference" and accordingly they reversed the Examiner. Judgment of priority was then rendered in favor of McInnerney by the Examiner of Interferences. Upon appeal the Examiners-in-Chief held that count 1 of the issue was limited to the inclusion of a plurality of springs, and that such limitation rendered the issue inapplicable to McInnerney's construction. In accordance with the rule they called the attention of the Commissioner to the fact that in their opinion McInnerney had no right to make the claim which corresponded to the first count of the issue. They found that he had the right to make the claim constituting the second count of the issue and as to that issue they awarded priority to McInnerney, and to that extent affirmed the decision of the Examiner of Interferences. An appeal was taken by Podlesak and Podlesak to the Commissioner, who, without deciding the question of priority, remanded the interference to the Primary Examiner to consider McInnerney's right to claim the first issue and directed him to consider the right of McInnerney to claim the second count, saying:

> Without expressing any opinion upon the question of the right of McInnerney to make a claim corresponding to count 2, it is believed that the conditions of this case are such as to warrant jurisdiction being given the Examiner to consider the right of McInnerney to make a claim corresponding to count 2 when the interference comes before him to consider the question to which attention has been called by the Examiners-in-Chief.
>
> This interference is therefore remanded to the Primary Examiner to consider the matters to which attention has been called by the Examiners-in-Chief and jurisdiction is also given to the Examiner to consider at the same time the right of McInnerney to make a claim corresponding to count 2.
>
> The decision on priority of invention is reserved pending the determination of the question of the dissolution of this interference.

Under this authority the Primary Examiner considered the right of McInnerney to make the claims constituting counts 1 and 2 of the issue. He filed a written decision to the effect that McInnerney had no right to make the first claim, but that the second claim could be equally well read upon the structure of both applicants and that therefore McInnerney had the right to make the claim constituting the second issue. From this decision no appeal was taken by McInnerney, and therefore the interference was continued with but one issue. The Commissioner when the matter next came before him awarded priority of invention of the second and sole remaining count to McInnerney.

The issue in question is:

> 2. The combination, in electrically operated or actuated sparking devices for gas or vapor ignition, of an electromagnet and its movable armature, with a movable electrode; a means of imparting a separating and a contacting blow, successively, from and through the movement of said armature to said movable electrode; an insulated electrode; an electric circuit supplying current to the energizing-coils of said electromagnet and to said electrodes, substantially as and for the purposes set forth.

McInnerney is the senior party having filed his application November 21, 1899. The Podlesaks filed their application April 2, 1900. The only testimony taken by them upon the question of the date of their invention is their own depositions. The depositions of parties to interferences upon this point, unless corroborated by "independent circumstances established by the evidence" are clearly insufficient to prove conception of an invention. (*Garrells* v. *Freeman*, 21 App. D. C., 207.)

It is insisted however by appellants that H. J. Podlesak communicated the invention to McInnerney, and that that fact is proven because not denied by the latter. In *Winslow* v. *Austin* (14 App. D. C., 137) this court held that the failure of a party to an interference to rebut the sworn statement of his adversary that he had fully disclosed the invention to him furnished strong evidence that the latter was not the prior inventor. We think the evidence disclosed by the record is not sufficient to warrant the application of that rule in this case. H. J. Podlesak does not claim to have made a complete disclosure to McInnerney. He claims to have made such partial discovery on October 27, 1899. It appears that Foster and Freeman on October 30, 1899, received from McInnerney a letter bearing date October 25, 1899, and a type-written description of his invention which is involved in this interference bearing date October 24, 1899, and also a drawing in pencil. It is insisted on the part of appellants that this latter statement and drawing were prepared after the alleged disclosure to McInnerney and that the papers were antedated. They seek to prove this by showing that a letter mailed in time to be forwarded on a train leaving Omaha (McInnerney's place of residence) at 3.30 p. m. of one day would in the ordinary course reach Washington the early morning of the second day thereafter. It is claimed by McInnerney that these papers were mailed on October 25, 1899, but it is not shown that they were mailed in time for the train leaving Omaha at 3.30 p. m. of that day. The probability would favor the supposition that they were mailed at a later hour. No facts are given relative to the time when other through mail-trains leave Omaha for the east. If the papers left on the same train on the following day they would not have arrived in Washington, if on time, until the morning of Saturday the 28th of October. It further appears that the mails are sometimes delayed twelve or thirteen hours, and if it happened in this instance, the papers would not have been delivered until October 30, 1899, for the 29th was Sunday. We think the proof offered is not sufficient to warrant a finding that the papers were prepared and mailed after the alleged disclosure by H. J. Podlesak.

The appellants being entitled to no earlier date of conception than that of the filing of their application they cannot prevail, if McInnerney is held to be properly a party to the interference, for their application was filed several months after that of McInnerney, the senior party. The Commissioner of Patents having found there was an interference in fact, and that McInnerney had the right to make the claim, could come to no other conclusion upon the proofs, and the law applicable thereto than the one he did and consequently his award of priority is correct if the remaining questions be decided in McInnerney's favor.

This brings us to the only serious questions in the case. They are those set out in the second and third assignments of errors and respectively present for consideration appellants' contention that there is no interference in fact between the inventions of the interferants; and that the appellee has not the right to make the claim which is the subject-matter of the issue.

Considering these assignments of error in the reverse order in which they are set forth we find that the question of appellee's right to make the claim has received the consideration of the Primary Examiner, of the Examiners-in-Chief and of the Commissioner. Where a question such as this has been fully considered by them, and all have concurred in finding a party to an interference has the right to make a claim which is the same as the count of the issue of an interference, their concurrent finding should not be lightly disturbed and will be ordinarily considered by this court as conclusive. In an *ex parte* case the decision of the Primary Examiner that a party has a right to make a claim is final unless for good cause shown the Commissioner, under his supervisory powers, takes jurisdiction to review the question. It is generally left to courts in a suit brought after the issue of the patent, for infringement of a claim thus allowed to determine whether the patentee ever had a right to make the claim. If however an interference, involving such claim, be instituted the rules of the Patent Office provide for an examination by the Primary Examiner of the question of the right of either party to make the claim. If his decision be in the affirmative the rules do not provide for an appeal to the Examiners-in-Chief. In *Allen* v. *United States ex rel. Lowry* (116 O. G., 2252) this court held that where such a decision was rendered by the Primary Examiner on a motion to dissolve no appeal would lie. It was there said that the court had reviewed other ancillary questions when they properly came before it on appeal from final judgments awarding priority of invention. The question of the right of a party to make a claim goes to the very foundation of an interference for if the party has not such right the interference falls. If it be incorrectly held that such party has a right to make the claim priority may be awarded to him and his adversary be deprived of a substantial right in that he is not given a claim where he necessarily is the prior inventor, his adversary never having made the invention. Manifestly that question should not be finally determined by the Primary Examiner who originally declared the interference. We therefore take jurisdiction to determine

that question in this case as an ancillary question to be considered in awarding priority of invention. Where however three tribunals of the Patent Office have concurred in answering the question in the affirmative, as they have in this case, we shall follow them unless a manifest error has been committed. Is there such error in this case? Appellants in their appeal from the decision of the Examiner of Interferences raised the question of appellee's right to make the claim. The Examiners-in-Chief considered the question and after describing the construction and operation of appellee's device reached the following conclusion:

> We do not find, however, that Podlesak & Podlesak should be sustained in their contention that McInnerney is not entitled to make a claim in conformity with count 2 of the issue. The point that the joint interferants raise in respect to this count has already been referred to herein. McInnerney's construction includes all of the elements of count 2, and considering the slight * * * separation which takes place between the movable and the stationary electrodes, it is apparent that the single spring which actuates the pivoted armature must cause said armature to deliver to the arm of the pivoted electrode a blow which will be effective to some extent in displacing carbon between the two electrodes *at the moment* of contact.

In view of the fact that the Examiners-in-Chief held that appellee did not have the right to make another claim the Commissioner as we have said withheld his decision on the question of priority and remanded the case to the Primary Examiner to consider the right of appellee to make either or both of the claims. The Examiner held "that McInnerney is entitled to make the claim forming count 2. Every element called for by this claim appears in Figure 3 of McInnerney's structure." This conclusion was accepted by the Commissioner. We have examined Fig. 3 of the drawing referred to and are of the opinion that the figure discloses a device which may be described in the terms of the now sole issue of the interference. We are not however satisfied that the claim means the same when applied to the devices of the respective parties. We now only say that we think this claim when broadly considered can be read on the drawing of McInnerney's application. It does not however follow that because the same words may describe two structures that differ materially in construction and in operation that the structures are the same. General terms may be used which apply equally to two structures which are not the same, as may be shown when those terms are read and construed in the light of the specifications behind them. In most cases, however, where two structures are not specifically the same, and the art does not warrant a generic claim, the language of the claims can be made precise and to fittingly describe each structure so that the use of identical language be avoided. We conclude, though not without some doubt, that McInnerney has the right to make the claim which is the issue of the interference, if that claim be broadly construed.

The last assigned error—no interference in fact—raises the question of identity of the two inventions as summed up in the issue. While as we have said the same language may be applied to two structures that are not the same the employment of such identical language does not necessarily prove that there is an interference in fact. (*Edgecomb* v. *Eastman* v. *Houston*, 89 O. G., 707; *Goss* v. *Scott*, 96 O. G., 843.)

We are much impressed with appellants' contention that there is no interference in fact because the two devices are obviously different in structure and operation, and that consequently the terms of the issue when applied to the two devices do not mean the same thing. It will be remembered that the Primary Examiner held the issue to be unpatentable; that the Examiners-in-Chief reversed him upon the ground that this issue when construed in the light of the specification required that the "blow" referred to in the claim must be a "contacting blow," and that the device of the reference brought the electrodes into contact without any blow by the armature. It was upon such a narrow construction that the claim was held patentable over the reference. It is the "contacting blow" which apparently gives novelty to the issue. What this "contacting blow" is must be determined by a reference to the appellants' specification for the issue is a claim first made by them and suggested to the appellee. The meaning given to the counts of an interference must be that intended by the party to the interference first making the claim. (*Tracy* v. *Leslie*, 14 App. D. C., 126; *Ruete* v. *Elwell*, 15 App. D. C., 21.)

The "contacting blow" is referred to in appellants' specification as the blow which—

> causes the contact-points to come together, driving out from between them any soot or dirt that may have accumulated from the explosion of the charge in the engine-cylinder.

When so construed we do not think that the term "contacting blow" as employed by the parties means the same thing in the two claims. It would seem that the Examiner when he considered the question of interference in fact, as he did, though as the Commissioner said without authority, must have lost sight of the ground on which the Examiners-in-Chief predicated patentability over the Tirrell patent, and of their statement relative to the difference between the device of that patent and the device of the appellants, of which they said:

> The difference in the action of the two devices is material, as the present device has superior utility because of the blow given by the armature after the spring has brought the electrodes into more or less feeble contact.

He doubtless did not examine the brief of McInnerney stated to have been filed before the Examiners-in-Chief when that tribunal was considering the question of patentability. That brief is referred to in appellants' brief but as it is not in the record we cannot consider it. It seems to us that the Examiners-in-Chief in holding the claims to be patentable must have construed them in the light of the Podlesaks specification rather than with McInnerney's specification before them.

We do not think the contacting blow of the McInnerney device, if it can be said to have anything more than an impulse, is the "contacting blow" of the Podlesak and Podlesak device.

This court has held that in extreme cases where palpable error has been committed the decision of the Patent Office holding identity of invention between the devices of parties to an interference may be reversed. (*Swihert* v. *Mauldin*, 19 App. D. C., 570, 573; *Seeberger* v. *Dodge*, 24 App. D. C., 476, 481.) Nevertheless while we consider that an error has been committed in this case we hesitate, at least until the Patent Office has further opportunity to consider this question to hold there is no interference in fact. As the case is now presented we are unwilling to award priority of invention to appellee. We think neither party is entitled to a claim, for the feature here in controversy, which shall dominate the other. It would seem that the claims presented by both, and made the issue of this interference, should be so re-formed that each should have a specific claim provided each can draw a claim that avoids the reference. We do not mean to hold that appellants' claim, which has been held patentable, is not patentable as read in the light of their specification. If, as we think, the claim read in the light of their specification means one thing, and the same claim read in the light of appellee's specification means another the same phraseology should not be employed.

We feel constrained to remand the case to the Commissioner of Patents for further consideration as to identity of invention. If after such consideration the Patent Office adheres to the opinion that there is an interference in fact herein the present interference record, with any additions to it will be further considered by us.

The opinion and the proceedings in the case will be certified by the clerk to the Commissioner of Patents, according to law.

Notice.

Hereafter coupons unless properly filled out will not be accepted in payment of copies of publications.

Trade-Marks.

The publication of trade-marks under the act of February 20, 1905, in the OFFICIAL GAZETTE, commenced May 2, 1905, and will appear in each weekly number of the GAZETTE thereafter.

Extra copies of the trade-mark portion of the GAZETTE, which will be sold separately, may be obtained single or in quantities for five cents each. Coupons will be taken in payment therefor.

Interference Notice.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 7, 1906.

John H. Thompson & Company, their assigns or legal representatives, take notice:

An interference having been declared by this Office between the application of Charles H. Montanye, of New York, N. Y., for registration of a trade-mark and a trade-mark registered to John H. Thompson & Company, of Detroit, Mich., and the notice of said declaration mailed by the Patent Office in the usual manner to the said John H. Thompson & Company having been returned undelivered, notice is hereby given to the said John H. Thompson & Company, their assigns or legal representatives, that if they or any of them desire to contest the said interference they should immediately put themselves in communication with the Commissioner of Patents, in order that the notices of declaration heretofore sent by and returned to the Office may be forwarded to them.

This notice will be published in the OFFICIAL GAZETTE for six consecutive weeks. If no appearance shall be entered at the expiration of the period of publication, the interference will be proceeded with as in case of default.

F. I. ALLEN,
Commissioner.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business February 13, 1906.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
	In arrears—Under fifteen days.			
226	XV. Bread, Pastry, and Confections, Making, Coating, Laminated Sheets and Fabrics, Fuel, Glass, Hydraulic Lime and Cement, Paper-Making, Paving, and Plastics.	Feb. 5	Dec. 12	233
128	II. Bee-Culture, Dairy, Label-Affixers, Paper Files and Binders, Presses, Store-Service, Tobacco, etc.	Feb. 1	Nov. 18	217
148	XXXII. Carbonating Beverages, Dispensing Beverages, Dispensing-Cans, Metallic Shipping and Storing Vessels, Packaging Liquids, Paper Receptacles, Refrigeration, Wooden Receptacles.	Feb. 1	Sept. 29	588
226	XL. Boot and Shoe Making, Boots, Shoes, and Leggings, Button, Eyelet, and Rivet Setting, Leather Manufacturing, Nailing and Stapling, Check-Controlled Apparatus, Whips and Whip Apparatus.	Feb. 1	Aug. 30	342
222	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	Jan. 31	Jan. 17	233
276	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Care of Live Stock, Fishing and Trapping, Stationery, Stone-Working.	Jan. 31	Jan. 2	297
321	I. Tillage, etc., Fences, and Railway Draft Appliances.	Jan. 30	Jan. 10	193
244	XXXV. Baggage, Buckles, Buttons, and Clasps, Card, Picture, and Sign Exhibiting, Deposit and Collection Receptacles, Package and Article Carriers, Packing and Storing Vessels, Photography.	Jan. 30	Dec. 12	472
368	XVII. Linotyping, Printing, Matrix-Making, Nut and Bolt Locks.	Jan. 30	Nov. 23	335
144	XXIV. Apparel, Apparel Apparatus, Sewing-Machines, Surgery, Toilet.	Jan. 30	Oct. 23	462
379	XXIII. Acoustics, Coin-Handling, Horology, Recorders, Registers, Optics, Signals, Time Controlling Mechanism.	Jan. 30	Sept. 30	552
	Under one month.			
175	III. Annealing and Tempering, Coating with Metal, Electrochemistry, Metal-Founding, Metallurgy, Shaping Fluid Metal.	Jan. 27	Dec. 26	283
304	XXXIV. Railways, Railway-Brakes, Rolling-Stock.	Jan. 24	Oct. 27	325
133	XXII. Air-Guns, Ammunition and Explosive Devices, Boats and Buoys, Catapults and Targets, Firearms, Marine Propulsion, Ordnance, Ships.	Jan. 24	Oct. 19	258
179	XX. Artificial Limbs, Builders' Hardware, Dentistry, Locks and Latches, Safes, Undertaking.	Jan. 24	July 7	373
152	XXX. Fluid-Pressure Regulators, Lamps and Gas-Fittings, Type-Writing Machines.	Jan. 23	May 18	675
107	XXXVII. Electricity, Conductors, Lighting, Special Apparatus.	Jan. 22	June 14	722
332	X. Carriages and Wagons	Jan. 20	Sept. 26	333
318	VI. Bleaching and Dyeing, Chemicals, Explosives, Fertilizers, Medicines, Preserving, Sugar and Salt.	Jan. 19	Nov. 21	372
122	XIX. Stoves and Furnaces and Steam-Boiler Furnaces.	Jan. 19	Aug. 14	620
105	XXVI. Electricity, Generation, Electric Heaters, Electric Railways, Motive Power.	Jan. 18	Aug. 7	714
224	XII. Elevators, Journal-Boxes, Lubricators, Machine Elements, Pulleys and Shafting.	Jan. 17	Nov. 29	294

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
232	IV. Bridges, Conveyers, Cranes and Derricks, Excavating, Hoisting, Hydraulic Engineering, Loading and Unloading, and Towers.	Jan. 15	Jan. 16	288
167	V. Fine Arts, Bookbinding, Harvesters, Jewelry, and Music.	Jan. 15	Dec. 7	364
172	XXXI. Alcohol, Charcoal and Coke, Distillation, Gas, Heating and Illuminating, Hides, Skins, and Leather, Liquid Coating Compositions, Oils, Fats, and Glue, Water Purification.	Jan. 13	Dec. 29	227
112	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	Jan. 13	Aug. 3	538
	Between one and two months.			
327	XVIII. Steam-Engineering, etc	Jan. 10	Nov. 2	499
164	XXXIII. Canes, Canopies, Cutlery, Domestic Cooking Vessels, Electricity, Medical and Surgical, Electric Signaling, Fireproof Buildings, Harness, Masonry, Tents, and Umbrellas.	Jan. 10	Sept. 1	738
137	VIII. Beds, Chairs, Furniture, Kitchen and Table Articles, Store Furniture.	Jan. 9	Oct. 9	554
307	XIV. Cutting and Punching Sheets and Bars, Farriery, Metal-Bending, Metal-Ornamenting, Metal Personal Wear, Making, Sheet-Metal Ware, Making, Tools, Wire-Working.	Jan. 9	Sept. 21	278
312	VII. Velocipedes, Clutches, Fire-Escapes, Games and Toys, Ladders, Mechanical Motors, and Paper Manufactures.	Jan. 6	Nov. 1	431
147	XXIX. Coopering, Roofs, Wheelwright-Machines, Wooden Buildings, Wood-Sawing, Wood-Turning, Woodworking-Tools.	Jan. 3	Oct. 18	364
109	XVI. Telegraphy and Telephony	Dec. 23	Dec. 9	269
375	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, Washing Apparatus.	Dec. 22	Aug. 23	683
382	XXVIII. Air and Gas Engines, Air and Gas Pumps, Pneumatics.	Dec. 19	June 1	945
	Between two and three months.			
330	XIII. Arms, Projectiles, and Explosive Charges, Making, Metal-Working, Needle and Pin Making.	Dec. 8	Sept. 6	579
142	IX. Baths and Closets, Fire-Extinguishers, Hydraulic Motors, Pumps, Sewerage, and Water Distribution.	Dec. 7	June 19	1069
	Between three and four months.			
315	XXV. Butchering, Mills, Threshing, and Vegetable Cutters and Crushers.	Nov. 6	Aug. 18	532

Total number of applications awaiting action 18,007

159	TRADE-MARKS, DESIGNS, LABELS AND PRINTS.			
	Between one and two months.			
	Trade-Marks	Jan. 4	Jan. 2	2924
	Under fifteen days.			
	Designs	Feb. 9	Jan. 3	49
	Labels and Prints	Feb. 12	Feb. 3	33

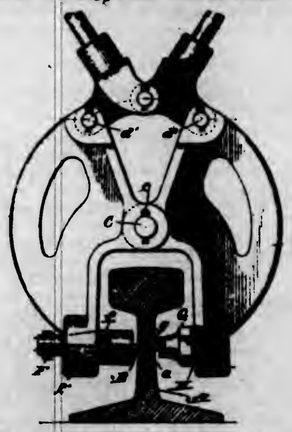
Examiners' Letters and Amendments.

Examiners are directed to recite in each letter in an application the date of the action by the applicant to which it is a reply, and applicants are requested to indicate in their actions on an application the date of the last Office letter.

PATENTS

GRANTED FEBRUARY 20, 1906.

812,803. **TOOL FOR BONDING RAILS.** FRED C. ARNY, Chicago Heights, Ill. Filed Aug. 15, 1905. Serial No. 269,882.



Claim.—1. In a portable tool for bonding railroad-rails by axially compressing the bonding-wire, the combination with a pair of relatively movable jaws spaced apart to straddle the head of the rail and extend downwardly opposite a given point in the rail-web, toggle-links operatively connected to said jaws, means for operating said toggle-links and thereby relatively moving the free ends of said jaws toward the rail-web, and means carried by said jaws for rigidly engaging the wire at predetermined points.

2. In a device for bonding railroad-rails, the combination with a pair of pivotally-united jaws spaced apart to straddle the head of the rail and extend downwardly opposite a given point in the rail-web, of a pair of toggle-links interposed between and operatively connected to said jaws, means for operating said toggle-links to move the free ends of the jaws toward a common point in the rail-web, and means carried by the free ends of said jaws for rigidly engaging a wire at predetermined points.

3. In a device for bonding railroad-rails, the combination with a pair of pivotally-united jaws spaced apart to straddle the head of the rail and extend downwardly opposite a given point in the rail-web, of a pair of toggle-links interposed between and operatively connected to said jaws, means for operating said toggle-links, a clamp carried by one jaw adapted to rigidly engage a wire, and means carried by the second jaw to rigidly engage the wire at a predetermined distance from said clamp.

4. In a device of the character described, the combination with a pair of pivotally-united jaws spaced apart to straddle the head of a rail and extend downwardly on opposite sides of the web thereof, of a pair of toggle-links interposed between and operatively connected to said jaws, means for operating said toggle-links, a clamp carried by one jaw adapted to rigidly engage a wire at a predetermined distance from its end, and a die carried by the second jaw adapted to engage the end of the wire.

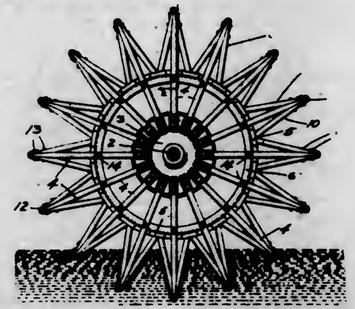
5. In a device of the character described, the combination with a pair of pivotally-united jaws, of a pair of toggle-links interposed between and operatively connected to said jaws, means for operating said toggle-links, a two-part clamp loosely extending through a tapered opening in the lower end of one jaw adapted to grip the wire at a predetermined distance from its end, and a die carried by the other jaw adapted to engage the end of the wire.

6. In a device of the character described, the combination with a pair of pivotally-united jaws, of a pair of toggle-links interposed between and operatively connected to said jaws, means for operating said toggle-links, a two-part clamp loosely extending through a tapered opening in the lower end of one jaw having grooves between which a portion of the wire is gripped, a spring interposed between the two parts of said clamp, and a die carried by the second jaw adapted to engage the end of the wire.

812,804. **NON-REFILLABLE BOTTLE.** ALEXANDER BENNETT, Buffalo, N. Y. Filed May 15, 1905. Serial No. 260,486.

Claim.—The combination with the receptacle having a neck provided internally with a depression, of a hollow stopper having a groove arranged lengthwise thereof, a spring having a curved center portion lying in contact with the inner wall of said groove and its upper end engaging the upper wall of said depression in the neck, and an outwardly-opening valve in said stopper.

812,805. **PADDLE-WHEEL.** JOHN BEST, Jeannette, Pa. Filed Apr. 17, 1905. Serial No. 256,006.



Claim.—1. A paddle-wheel comprising a shaft, spokes radiating from said shaft, a drum beyond which said spokes extend, and a series of paddles whose faces slope in opposite directions from said spokes to said drum.

2. A paddle-wheel comprising a shaft, spokes radiating therefrom, a drum, a series of V-shaped paddles secured to said spokes and to said drum.

812,806. **METAL WINDOW-BOX FOR FLOWERS.** EMMA B. BUTLER, Boston, Pa. Filed Aug. 10, 1905. Serial No. 273,868.

Claim.—1. A device of the class described, comprising a metallic box designed to be placed on a window-sill and provided at its outer portion with supporting-legs, and a drain-pipe or tube located at the outer portion of the box and having its bottom located in a plane above the lower ends of the legs, whereby it is maintained out of contact with the window-sill.

2. A device of the class described, comprising a plant-box provided at its outer portion with supporting-legs, said box being also

provided at intervals with drain-apertures, and a drain pipe or tube secured to the bottom of the box beneath the drain-apertures.

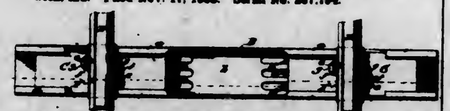
3. A device of the class described, comprising a window-box provided at its outer portion with legs and having a drain pipe or tube, and a drip-pan receiving the drain pipe or tube and detachably supported by the said box, the bottom of the drip-pan being arranged in a plane above the lower ends of the legs.

4. A device of the class described, comprising a plant-box provided at its outer portion with legs and having drain-apertures, a tapering drain pipe or tube secured to the bottom of the box and having an inclined bottom, and a drip-pan removably suspended from the bottom of the box and receiving one end of the drain pipe or tube.

5. A device of the class described, comprising a plant-box provided with a drain pipe or tube and having a drain-aperture communicating with the same, a drip-pan provided at one side with an opening arranged to receive one end of the drain pipe or tube, said drip-pan being also provided with opposite supporting-flanges, guides or ways receiving the supporting-flanges, the drip-pan being of a width less than the space between the guides or ways, whereby it is capable of lateral movement to engage and disengage the drain pipe or tube.

6. A device of the class described, comprising a plant-box provided with a drain pipe or tube and having a drain-aperture communicating with the same, a drip-pan provided at one side with an opening arranged to receive one end of the drain pipe or tube, said drip-pan being also provided with opposite supporting-flanges, guides or ways receiving the supporting-flanges, the drip-pan being of a width less than the space between the guides or ways, whereby it is capable of lateral movement to engage and disengage the drain pipe or tube, the distance between each side wall of the drip-pan and the outer edge of the flange of the opposite wall being greater than the width of the space between the guides or ways to prevent the drip-pan from becoming disengaged by the said lateral movement.

812,807. **RAILWAY-TIE.** ZACHARY T. BOOTH and JAMES F. BUTLER, Brunswick, Md., assignors of one-third to Christian Smith, Brunswick, Md. Filed Nov. 17, 1905. Serial No. 287,704.



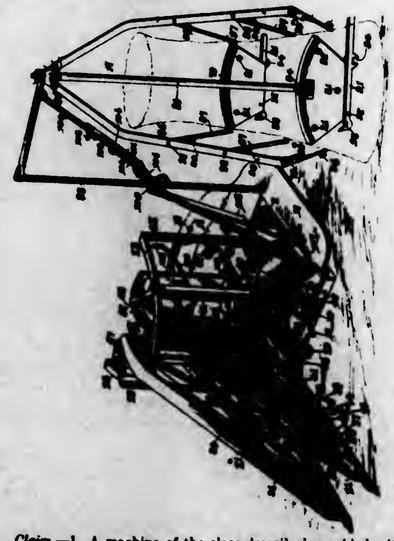
Claim.—1. A metal railroad-tie comprising a bottom and side walls integral with each other, blocks located between the side walls and a plurality of fenders integral with the bottom of the tie and extending up vertically to hold the ballast in place within the tie when either block is removed, substantially as and for the purpose described.

2. A metal railroad-tie comprising a bottom and side walls integral with each other, blocks located between the side walls, vertically-extending fenders abutting against the inner ends of the blocks, and clamping-supports having downwardly-extending ends to embrace the side walls of the tie and having lugs with elongated openings therein for suitable spikes or like fastening means to hold the rails on the supports, substantially as and for the purpose set forth.

812,808. **WINDOW-SASH ADJUSTER.** HARVEY BOWERS, Wichita, Kans. Filed Apr. 5, 1904. Serial No. 201,703.

Claim.—In a window-sash adjuster, a plate secured to a lower sash, said plate having top and side flanges, said top flange being provided with an aperture, gripping-dogs pivoted to the plate and depending one toward the other, but not contacting, serrations on the opposed faces, lugs formed on the outer face of one of the dogs, and at right angles thereto, a longitudinal extension on the opposite dog and on the outer face thereof, said extension bridging the space between the opposing faces of the dogs and loosely fitting between the lugs, a depending arm formed on one of the dogs and terminating in an eye, a spring interposed between the depending arm and one of the side flanges of the plate, a pulley on the window-frame, a flexible connection secured at one end to the top sash and passing over the pulley and through the aperture in the top flange of the plate between the opposing faces of the dogs and adapted to be engaged thereby, and through the eye on the depending arm, the extension on the dog acting as a guide for said flexible connection.

812,809. **CORN-SHOCKER.** OLIVER BOYER, Conneat, Ohio. Filed July 5, 1904. Serial No. 215,277.



Claim.—1. A machine of the class described provided with a shock former and carrier movable toward and from the machine for depositing the shock upon the ground, said shock former and carrier being provided with supporting sides movable outwardly to facilitate the discharge of the shock.

2. A machine of the class described provided with a shock former and carrier movable toward and from the machine for depositing the shock upon the ground, said shock former and carrier being provided with hinged supporting sides arranged to swing outwardly to facilitate the discharge of the shock.

3. A machine of the class described provided with a shock former and carrier movable toward and from the machine for depositing the shock upon the ground, said shock former and carrier having a sectional bottom and provided with hinged sides arranged to swing outwardly.

4. A machine of the class described provided with a shock former and carrier having sides and provided with a sectional bottom carried by and hinged to the sides, and automatic means mounted on the sides and connected with the sections of the bottom for returning the same to a horizontal position.

5. A machine of the class described provided with a shock former and carrier having sides and provided with a sectional bottom carried by and hinged to the sides, and springs connected with the sides and with the sections of the bottom for returning the latter to a horizontal position.

6. A machine of the class described provided with a shock former and carrier composed of upwardly-extending side bars movably connected at the top, and a sectional bottom, the sections of the bottom being connected with the side bars and carried by the same.

7. A machine of the class described provided with a shock former and carrier, comprising upwardly-extending sides pivotally connected at the top, and a bottom composed of sections hinged to the lower ends of the side bars and adapted to swing downward for discharging a shock.

8. A machine of the class described povided with a shock former and carrier having a sectional bottom and provided with movable sides opening outwardly to facilitate the discharge of the shock, and stays dividing the shock former and carrier into separate spaces or compartments and connected at their outer ends to the sides and carried by the same.

9. A machine of the class described provided with a shock former and carrier having a sectional bottom and provided with movable sides opening outwardly to facilitate the discharge of the shock, and stays dividing the shock former and carrier into separate spaces or compartments and hinged at their outer ends to the sides and adapted to swing downwardly.

10. A machine of the class described provided with a shock former and carrier movable toward and from the machine for depositing the shock upon the ground, said shock former and carrier being provided with a sectional bottom and having supporting sides movable outwardly to facilitate the discharge of the shock, each side carrying a section of the bottom.

11. A machine of the class described provided with a shock former and carrier movable toward and from the machine for depositing the shock upon the ground, said shock former and carrier being provided with supporting sides movable outwardly to facilitate the discharge of the shock, and stays dividing the shock former and carrier into separate spaces or compartments and connected at their outer ends to the sides and carried by the same.

12. A machine of the class described provided with a collapsible shock former and carrier, comprising upwardly-converged side bars, a head to which the upper ends of the bars are pivoted, a bottom composed of sections hinged to the lower ends of the bars, and radial stays also pivoted to the bars.

13. A machine of the class described provided with a shock former and carrier having a bottom composed of sections, and a horizontally-swinging locking-lever detachably connecting the sections.

14. A machine of the class described provided with a shock former and carrier having a bottom composed of sections, a locking-lever pivotally mounted on one of the sections and arranged to swing horizontally, and means carried by the adjacent section for engagement with the locking-lever.

15. A machine of the class described provided with a shock former and carrier having a bottom composed of three or more sections, a locking-lever pivoted to one of the sections and provided at opposite sides of the pivot with engaging portions, and studs mounted on the adjacent sections for engagement with the lever.

16. A machine of the class described provided with a shock former and carrier having a bottom composed of three or more sections, locking-levers mounted on the bottom and provided with notches, and headed studs carried by the sections for engagement with the notches of the levers.

17. A machine of the class described provided with a shock former and carrier having a bottom composed of substantially quadrant-shaped sections, and locking-levers fulcrumed on opposite sections and each interlocked with the adjacent sections.

18. A machine of the class described provided with a shock former and carrier having a bottom composed of substantially quadrant-shaped sections, and a pair of locking-levers pivoted between their ends on two opposite sections and each provided at opposite sides of its pivot with means for engaging the two other sections of the bottom.

19. In a machine of the class described, the combination of a shock former and carrier, and a crane comprising a rotary standard, an arm extending from the standard and movable upwardly and downwardly and connected with the former and carrier, an extensible brace composed of sections or members slidable on each other and connected with the arm, means for extending the sections, and locking mechanism for securing the same in their adjustment.

20. In a machine of the class described, the combination of a main frame, a rotary support, a shock former and carrier interlocked with the support, a crane mounted on the main frame adjacent to the support and having a standard and provided with an arm connected with the shock former and carrier, an extensible brace composed of sections slidable on each other and connected respectively with the standard and with the arm, one of the sections being provided with ratchet-teeth, a pawl mounted on the other section for engaging the ratchet-teeth, and hoisting mechanism for extending the sections.

21. In a machine of the class described, the combination of a rotary support having a projecting polygonal portion, and a shock former and carrier provided at its bottom with an opening receiving the said polygonal portion, whereby the shock former and carrier is interlocked with the support.

22. In a machine of the class described, the combination of a rotary support having a projecting portion, and a shock former and carrier provided with a bottom composed of separable truncated sections forming an opening to receive the projections.

23. In a machine of the class described, the combination of a rotary support having a polygonal portion and provided with projections, and a shock former and carrier provided with a bottom composed of truncated sections forming an opening to receive the polygonal portion and having perforations for the reception of the said projections.

24. In a machine of the class described, the combination of a rotary shock-former, means movable in one direction for rotating the shock-former, mechanism for throwing the said means in the opposite direction, gearing for actuating the said means, and means for throwing the gearing out of operation.

25. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, means for rotating the ratchet-wheel, gearing for actuating the said means, and means for throwing the gearing into and out of operation.

26. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected with the former, means embodying a pawl for rotating the ratchet-wheel, gearing for moving the said means in one direction, and a spring for returning the said means to its initial position.

27. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, an oscillatory member having a pawl for engaging the ratchet-wheel, gearing for moving the oscillatory member in one direction, and a spring for returning the oscillatory member to its initial position.

28. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel, a movable member provided with means for rotating the ratchet-wheel, gearing for actuating the said member, and a trip for throwing the gearing out of operation.

29. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, a movable member having means for engaging the ratchet-wheel to rotate the same, gearing embodying a sprocket-chain connected with the said member for actuating the same, and means for throwing the gearing into and out of operation.

30. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, means for engaging the ratchet-wheel to rotate the same, gearing embodying a sprocket-chain and a clutch, a reciprocating member connected with the sprocket-chain and with the said means, and a trip arranged in the path of the reciprocating member for operating the clutch to throw the gearing out of operation.

31. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, gearing embodying a sprocket-chain and having a clutch, a movable member having means for actuating the ratchet-wheel, a reciprocating bar connected with the movable member and with the sprocket-chain, a trip arranged in the path of the reciprocating bar for operating the clutch to throw the gearing out of operation, and a spring connected with the reciprocating bar for returning the parts to their initial position.

32. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, gearing embodying a sprocket-chain and having a clutch, means connected with the sprocket-chain for actuating the ratchet-wheel, a trip arranged in the path of the said means for operating the clutch to throw the gearing out of operation, and a spring connected with the said means for returning the same to its initial position.

33. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, gearing embodying a sprocket-chain, means movable in one direction by the sprocket-chain for actuating the sprocket-wheel, a spring for moving the said means in the opposite direction, and means for throwing the gearing into and out of operation.

34. In a machine of the class described, the combination of a rotary shock-former, a ratchet-wheel connected therewith, gearing embodying a clutch and a sprocket-chain, means movable in one di-

rection by the sprocket-chain for rotating the ratchet-wheel, a spring for moving the said means in the opposite direction, a trip arranged in the path of the said means for operating the clutch to throw the vertical shaft, a stowing device pivoted by the vertical shaft, feeding mechanism mounted on the stowing device and carried by the same in the movement thereof and also oscillating independently of the

Claim.—1. As a new article of manufacture, a manganese-steel rail of regulation size and form produced by casting it in the form in cooling process at a predetermined point above normal atmospheric temperature thereby to retain therein a certain part of its original

rection by the sprocket-chain for rotating the ratchet-wheel, a spring for moving the said means in the opposite direction, a trip arranged in the path of the said means for operating the clutch to throw the gearing out of operation, and shifting mechanism for operating the clutch to throw the gearing into operation.

35. In a machine of the class described, the combination of a rotary shock-former, feeding mechanism, a ratchet-wheel connected with the shock-former, gearing embodying a sprocket-chain and provided with a clutch, means movable in one direction by the sprocket-chain for actuating the ratchet-wheel, a trip arranged in the path of the means for operating the clutch to throw the gearing out of operation, and shifting mechanism operable by the feeding mechanism for throwing the gearing into operation.

36. In a machine of the class described, the combination of a rotary shock-former, means movable in one direction for rotating the shock-former, gearing for actuating the said means, and a trip arranged in the path of the said means for throwing the gearing out of operation.

37. In a machine of the class described, the combination of a rotary shock-former, means movable in one direction for rotating the shock-former, gearing for actuating the said means, a trip arranged in the path of the said means for throwing the gearing out of operation, and a spring for moving the said means in the opposite direction.

38. In a machine of the class described, the combination of a shock-former, and opposite stowing devices having curved guiding portions, and feeding mechanism carried by the stowing devices and movable inwardly and outwardly through slots in the guiding portions.

39. In a machine of the class described, the combination of a rotary shock-former, a stowing device movable into and out of the shock-former and arranged to be moved outward automatically by the material accumulating within the said shock-former, and means operable automatically by the stowing device for rotating the shock-former when the stowing device reaches the limit of its outward movement.

40. In a machine of the class described, the combination of a rotary shock-former, a stowing device movable into and out of the shock-former, and arranged to be moved outward automatically by the material accumulating within the shock-former, gearing for rotating the shock-former, and means carried by the stowing device for automatically throwing the gearing into operation.

41. In a machine of the class described, the combination of a rotary shock-former, a stowing device movable into and out of the shock-former and arranged to be moved outward automatically by the material accumulating within the shock-former, gearing for rotating the shock-former, and a trip for automatically throwing the gearing out of operation when the shock-former has moved a predetermined distance.

42. In a machine of the class described, the combination of a shock-former, a cutting apparatus, means for feeding the plants to the cutting apparatus, a movable stowing device located between the cutting apparatus and the shock-former, a feeding-arm carried by the stowing device, and crank mechanism connected with the feeding-arm for actuating the same independently of the stowing device.

43. In a machine of the class described, the combination of a shock-former, a cutting apparatus, means for feeding the plants to the cutting apparatus, a movable stowing device located between the cutting apparatus and the shock-former, a lever carried by and movable independently of the stowing device, and crank mechanism connected with the lever at a point between the ends thereof for actuating the same.

44. In a machine of the class described, the combination of a shock-former, a cutting apparatus, means for feeding the plants to the cutting apparatus, a movable stowing device located between the cutting apparatus and the shock-former, a feeding-lever carried by and movable independently of the stowing device, a link connected with one end of the feeding-lever, and a crank element connected with the feeding-lever between the ends thereof.

45. In a machine of the class described, the combination of a shock-former, a cutting apparatus, means for feeding the plants to the cutting apparatus, a pivotally-mounted stowing device, feeding-levers mounted on and movable independently of the stowing device, and a shaft having crank-heads connected with the feeding-levers.

46. In a machine of the class described, the combination of a pivotally-mounted stowing device provided with slots, feeding-levers extending through the slots, and a crank-shaft connected with the feeding-levers.

47. In a machine of the class described, the combination of a vertical shaft, a stowing device pivoted by the vertical shaft, feeding mechanism mounted on the stowing device and carried by the same in the movement thereof and also oscillating independently of the said stowing device, and gearing carried by the stowing device and operable by the said vertical shaft for actuating the feeding mechanism.

48. In a machine of the class described, the combination of a vertical shaft, a pivoted stowing device mounted on the shaft, a crank-shaft carried by the stowing device, and feeding-levers connected with the crank-shaft and carried by the stowing device in the movement thereof and also capable of an independent oscillatory movement, and gearing connecting the shafts.

49. In a machine of the class described, the combination of a rotary shock-former having separate spaces or compartments, and stowing means movable into and out of the spaces or compartments and arranged to be forced outwardly by the material accumulating within the shock-former.

50. In a machine of the class described, the combination of a rotary shock-former having separate spaces or compartments, stowing means movable into and out of the spaces or compartments and arranged to be forced outwardly by the material accumulating within the shock-former, and means operable by the said stowing means at the limit of the outward movement thereof for rotating the shock-former.

51. In a machine of the class described, the combination with a shock-former having compartments or spaces, and stowing means movable into and out of the compartments or spaces and arranged to be forced outward automatically by the material accumulating within the shock-former, said stowing means being also arranged to be moved inward automatically into an empty space or compartment by the material.

52. In a machine of the class described, the combination with a shock-former having compartments or spaces, stowing means movable into and out of the compartments or spaces and arranged to be forced outward automatically by the material accumulating within the shock-former, said stowing means being also arranged to be moved inward automatically into an empty space or compartment by the material, and means operable by the said stowing means at the limit of its outward movement for partially rotating the shock-former to present the spaces or compartments successively for filling.

53. In a machine of the class described, the combination of a shock-former, stowing means movable into and out of the shock-former and arranged to be forced outwardly by the material accumulating within the shock-former, and feeding means carried by the stowing means in the movement thereof and movable independently of the same.

54. In a machine of the class described, the combination with a shock-former, of a horizontally-swinging stowing device movable into and out of the shock-former and arranged to be forced outward automatically by the material accumulating within the shock-former, and feeding devices carried by the stowing devices in the inward and outward movements thereof and movable independently of the same, whereby the material is forced inwardly as the packers move outwardly.

55. In a machine of the class described, the combination with a shock-former, of a stowing device movable toward and from the shock-former and arranged to be forced outwardly by the material accumulating within the machine, and oscillatory feeding means carried by the stowing device and movable independently thereof, whereby it is adapted to force the material inwardly as the stowing device moves outwardly.

56. In a machine of the class described, the combination with a shock-former, of a stowing device movable into and out of the same and arranged to be forced outwardly by the material accumulating within the shock-former, and feeding means carried by the stowing device and movable independently thereof, whereby it is adapted to force the material inwardly as the stowing device moves outwardly.

57. In a machine of the class described, the combination with a shock-former having sector-shaped spaces or compartments, of oppositely-disposed horisontally-swinging stowing devices movable into and out of the compartments of the shock-former and arranged to be forced outwardly by the material accumulating within the same, said stowing devices being provided with curved guiding portions for engaging the material, and means mounted on the stowing devices for moving the material inwardly as the stowing devices move outwardly.

812,810. **CAST MANGANESE-STEEL RAIL.** WALTER BRINTON, High Bridge, N. J., assignor to Taylor Iron and Steel Company, a Corporation of New Jersey. Filed May 4, 1904. Serial No. 206,269.

Claim.—1. As a new article of manufacture, a manganese-steel rail of regulation size and form produced by casting it in the form in which it is to be used as a completed rail, and then toughening such rail.

2. As a new article of manufacture, a manganese-steel rail produced by casting it in the form in which it is to be used as a completed rail and thereupon toughening the rail by heating it and then cooling it.

3. As a new article of manufacture, a manganese-steel rail produced by casting it in substantially the form in which it is to be used; thereupon arresting the cooling of the rail after solidification; then toughening the rail by heating it rapidly up to a predetermined temperature, and then cooling it rapidly.

4. As a new article of manufacture, a manganese-steel rail produced by casting it in substantially the form in which it is to be used; thereupon arresting the cooling of the rail after solidification, thereupon placing the rail in a furnace having a temperature substantially corresponding to the then temperature of the rail and rapidly heating the rail in such furnace up to a predetermined temperature and thereupon immersing the rail in a cooling-bath.

5. As a new article of manufacture, a manganese-steel rail produced by casting it in substantially the form in which it is to be used; thereupon arresting the cooling of the rail after solidification; and then toughening the rail by heating it and then cooling it.

6. As a new article of manufacture, a manganese-steel rail produced by casting it in substantially the form in which it is to be used as a completed rail, then checking the cooling of the rail after solidification and before such rail reaches a period of rest from absence of heat, and then heating such rail beginning with the furnace in a heated state and applying the heat until the rail has reached a predetermined temperature, and then plunging the rail in cold water.

7. As a new article of manufacture, a manganese-steel rail produced by casting it in substantially the form in which it is to be used as a completed rail, then checking the cooling of the rail after solidification at a predetermined point above normal atmospheric temperature, then heating such rail beginning with the furnace in a heated state substantially corresponding to the temperature of the rail when the cooling thereof is checked, and then finally cooling the rail.

812,811. **PROCESS OF TREATING MANGANESE STEEL.** WALTER BRINTON, High Bridge, N. J., assignor to Taylor Iron and Steel Company, a Corporation of New Jersey. Filed May 5, 1904. Serial No. 206,523.

Claim.—1. The process herein described of toughening manganese-steel castings, consisting in heating a heated casting beginning with the furnace in a heated state, applying the heat until the casting has reached a predetermined temperature, and finally plunging the casting in cold water.

2. The process herein described of toughening manganese-steel castings, consisting in retaining in the casting a portion of its original casting heat, then heating such casting beginning with the furnace in a heated state, and applying the heat rapidly until the casting has reached a predetermined high temperature, and then finally plunging the casting in cold water.

3. The process herein described of toughening manganese-steel castings, consisting in checking the cooling of and retaining in the casting a portion of its original casting heat, then heating such casting beginning with the furnace in a heated state substantially corresponding to the temperature of the casting when the cooling thereof is checked, and then finally cooling the casting.

4. The process herein described of toughening manganese-steel castings, consisting in checking the cooling of and retaining in the casting a portion of its original casting heat, then rapidly heating such casting beginning with the furnace in a heated state substantially corresponding to the temperature of the casting when the cooling thereof is checked, and then finally plunging the casting in cold water.

5. The process herein described of toughening manganese-steel castings, consisting in heating them beginning with the furnace in a heated state and with the casting in a heated state, then heating such casting up to a predetermined point, and then finally cooling it.

6. The method of treating manganese steel which consists in maintaining in the steel a part of its formative heat by checking the cooling process at a predetermined point above normal atmospheric temperature thereby to retain therein a certain part of its original high heat determined by the size and design of the article, then heating such article up to a predetermined high temperature, and then rapidly cooling the same.

7. The method of toughening manganese steel which consists in checking the cooling of and maintaining in the article after it is cast, forged or rolled into its final finished shape for use as a manufactured article of commerce a predetermined amount of its casting, rolling or forging heat less than that originally present in the article and varying according to the size, character and design of the article, then heating such article from or substantially from the point where the cooling was checked up to a predetermined point, and then rapidly cooling the same.

8. The method of toughening manganese steel which consists in checking the cooling of and maintaining in the article after it is cast, forged or rolled into its final finished shape for use as a manufactured article of commerce a predetermined amount of its casting, forging or rolling heat less than that originally present in the article and varying according to the size, character and design of the article, then rapidly heating such article from or substantially from the point where the cooling was checked up to a predetermined point, and then rapidly cooling the same.

9. The method of treating steel having therein a predetermined percentage of manganese which consists in retaining therein a part of its original formative heat by checking the cooling of the steel before it reaches normal atmospheric temperature, then heating said steel up to a predetermined temperature substantially above a forging temperature, and then quickly cooling it.

10. The method of treating steel having therein a predetermined percentage of manganese which consists in retaining therein a part of its original formative heat by checking the cooling of the steel at a point above normal atmospheric temperature, then placing it in a heated furnace and rapidly heating it up to a predetermined temperature and then cooling it.

11. The method of treating steel having therein a predetermined percentage of manganese, which consists in maintaining in the article after it is cast or formed a certain amount of its casting or formative heat less than that originally present and ranging from a point above normal atmospheric temperature to a point about 1,000° Fahrenheit according to the size and design of the article, then placing the same in a heated furnace, then rapidly heating the article up to a predetermined high temperature, and then rapidly cooling it.

12. The method of toughening manganese steel, which consists in maintaining in the article after it is cast or formed a certain amount of its casting or formative heat less than that originally present in the article and ranging from about 150° Fahrenheit upward according to the size, character and design of the article, then placing the same in a heated furnace, then heating said article up to a predetermined temperature above a forging temperature and then quickly cooling the article.

13. The method of toughening manganese steel, which consists in first casting the steel into its final finished shape, then permitting the same to solidify to a point where it can be handled, then treating the article by covering it with sand to check the cooling thereof and maintain therein a part of its original temperature, determined by the size, character and design of the article and ranging above normal atmospheric temperature and below substantially 1,000° Fahrenheit, then placing the article in a furnace heated to a temperature substantially corresponding to the temperature remaining in the article and heating the same rapidly up to a predetermined high heat, and then immersing the article in water.

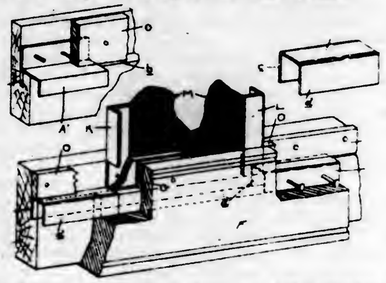
812,812. **SHOE.** FRANCOIS X. BROSSEUR, Lynn, Mass., assignor of one-half to Edward W. Mullins, Lynn, Mass. Filed Apr. 14, 1904. Serial No. 203,095.

Claim.—1. A shoe having an exposed counter, a lining, and top or quarter, the lower edge of the latter being overlapped by the upper edge of the counter, uniting-stitches passing through the said overlapped edges and the lining.

2. A shoe comprising a vamp, a top or quarter, an exposed counter having a skived upper edge and overlapping the said top or quarter, a lining and stitches passing through the said parts of the shoe to secure the lower edge of the top or quarter between the counter and the lining.

3. A shoe having an exposed molded counter, a lining, and top or quarter, the lower edge of the latter being overlapped by the upper edge of the counter, uniting-stitches passing through the said overlapped edges and the lining.

812,813. **WINDOW-SCREEN.** EDWARD T. BROWN, Owosso, Mich., assignor to Owosso Manufacturing Company, Owosso, Mich., a Corporation of Michigan. Filed July 20, 1903. Serial No. 166,236.



Claim.—1. In an extensible screen, two frames arranged to overlap and having oppositely-disposed channeled portions, the screen fabrics, and sliding connections between said frames including a plurality of coupling members substantially U-shaped in cross-section, one secured against longitudinal movement in the channeled portion of one of the frames and slidably engaging the channeled portion of the opposite frame, in combination with a retaining means in each of the channeled portions of the frames for the coupling members and screen fabrics.

2. In an extensible screen, two frames arranged to overlap and having oppositely-disposed channeled portions, the screen fabrics, and sliding connections between said frames including a plurality of coupling members substantially U-shaped in cross-section, one secured against movement in the channeled portion of one of the frames and slidably engaging the channeled portion of the opposite frame, in combination with retaining-strips in the channeled portions of the frames for the coupling members.

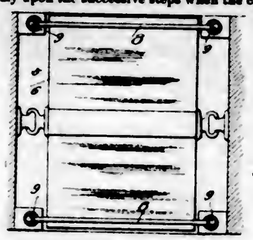
3. In an extensible screen, two frames arranged to overlap and having oppositely-disposed channeled portions including grooves in the frames, the screen fabrics, and sliding connections between the frames including a plurality of coupling members substantially U-shaped in cross-section, one secured against longitudinal movement in the channeled portion of one of the frames and slidably engaging the groove in the channeled portion of the opposite frame, in combination with retaining means in the channeled portions of the frames for the coupling members and screen fabrics.

4. In an extensible screen, two frames arranged to overlap and having oppositely-disposed channeled portions including grooves in the frames, the screen fabrics, and sliding connections between said frames including a plurality of coupling members substantially U-shaped in cross-section, one secured against movement in the channeled portion of one of the frames and slidably engaging the groove in the channeled portion of the opposite frame, in combination with retaining-strips in the channeled portions of the frames for the coupling members.

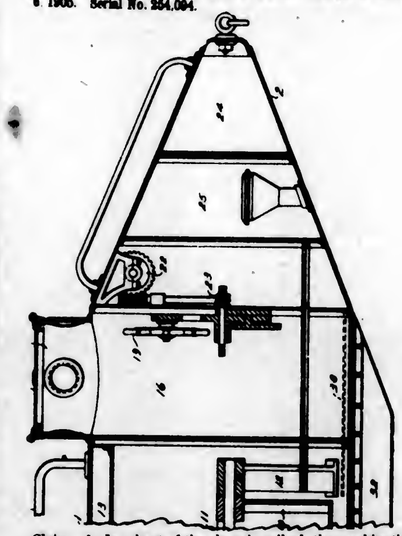
5. In a two-part screen, the combination of end rails, top and bottom rails, having recesses, and longitudinal vertical slots, extending from the rear and bottom of said recesses into the body of the rails, wire gauze or netting having its horizontal edges received and secured in said recesses, channel or U shaped clips, one for each rail, each clip having one leg secured in the slot, of one rail, and its other leg engaging and adapted to slide back and forth in the slot, of the adjoining-rail, and covering-strips, fitted and secured in the recesses, with their inner edges at such distance from the bottoms of the recesses as to permit the passage of the horizontal portion of the clips connecting the vertical legs of the latter, substantially as described.

812,814. **SHAFT-GATE.** GEORGE BROWN and GEORGE TAYLOR, Ladd, Ill. Filed Mar. 6, 1905. Serial No. 248,488.

Claim.—The combination with an elevator-shaft, of posts arranged at the landing and having a series of steps, a series of bars slidably mounted on the posts and extending across the entrance to the shaft, and constructed to be lifted by the elevator-cage, and which drop respectively upon the successive steps when the cage drops.



812,815. **LIFE-BOAT.** ROBERT A. BROWN, Chicago, Ill. Filed Apr. 6, 1905. Serial No. 254,094.



Claim.—1. In a boat of the class described, the combination of a hull, a propeller mounted at the stern of said hull, side fins hinged to the hull near its forward end, on horizontal axes, and stops to brace said fins against swinging below a substantially horizontal position, said fins being arranged to swing upward and being adapted to normally assume said horizontal position and resist the lifting of the bow of a hull when struck by a wave.

2. In a boat of the class described, the combination of a hull, twin propellers mounted at the stern of said hull, side fins hinged to the hull near its forward end, on horizontal axes, and stops to brace said fins against swinging below a substantially horizontal position, said fins being arranged to swing upward and being adapted to normally assume said horizontal position and resist the lifting of the bow of the hull when struck by a wave.

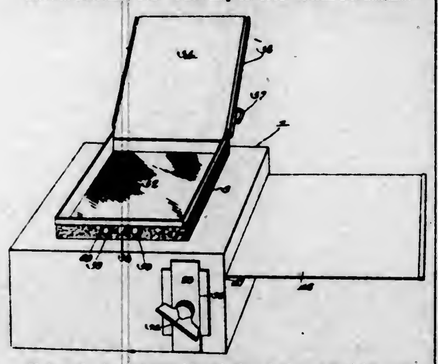
3. A boat having an overhanging end and having a pair of horizontally-disposed side fins hinged at opposite sides of the hull and near said end, said fins being free to fold upwardly against the hull, and stops for limiting the extended position of said fins when submerged, whereby said fins will act to check the lifting of said end of the boat when struck by a wave.

4. In a boat of the class described, the combination of an outer hull, an inner car journaled on a longitudinal axis within said hull and adapted to remain in equilibrium during the rolling of said outer hull, said hull being arranged to float in a normally upright position and having an air-tight compartment along its upper part adapted to cause said hull to assume an upright position when said hull is partly filled with water, the bottom of said air-tight compartment being of flatter curvature than that of an imaginary cylinder having its center coincident with the axis of said car and lying wholly outside of the circular path of rotation of said inner car.

5. In a boat of the class described, the combination of a hull, a car suspended within said hull and adapted to swing about a longitudinal axis and remain in equilibrium regardless of the rolling of said hull, a propeller mounted at the stern of said hull, side fins hinged to the hull near the forward end, on horizontal axes, and stops to brace said fins against swinging below a substantially horizontal position, said fins being arranged to swing upwardly and being adapted to normally assume said horizontal position and resist the lifting of the bow of the hull when struck by a wave

6. In a boat of the class described, the combination of a hull ovate in transverse section for the greater part of its length intermediate of its ends; said transverse section having an inner contour which is substantially semicircular in its lower part and which has side and top portions of flatter curvature than that of said lower part but lying wholly outside of a continuation of the circle of said lower part, and a car suspended within said hull and rotatable about a longitudinal axis which is below the center of said lower semicircular part of the hull.

812,816. **PHOTOGRAPHIC-PRINTING DEVICE.** WILLIAM H. BROWN, Lockhart, Tex. Filed May 15, 1905. Serial No. 260,580.



Claim.—1. A photographic-printing device comprising a case having an exposure-opening, a print-paper carrier mounted within the case, means mounted upon one end of the carrier for the rotatable support of a paper-holding spool, a paper-receiving spool mounted upon the other end of the carrier, means to rotate the receiving-spool to feed print-paper across the exposure-opening to the receiving-spool, and means to adjust the carrier toward and away from the exposure-opening.

2. A photographic-printing device comprising a case having an exposure-opening, a print-paper carrier mounted in the case and adjustable toward and away from the exposure-opening, and means upon the carrier for feeding print-paper across the exposure-opening to permit of successive exposures upon a continuous strip of print-paper.

3. A photographic-printing device comprising a case having an exposure-opening, a print-paper carrier mounted in the case and adjustable toward and away from the exposure-opening, means for feeding print-paper across the exposure-opening consisting of a receiving-spool mounted upon the carrier, means located upon the exterior of the case for rotating the feeding-spool, the case being provided with a slot to accommodate said operating means, and a closure-slide for the slot carried by the operating means.

4. A photographic-printing apparatus comprising a case having an exposure-opening, guideways leading toward the exposure-opening within the case, a print-paper carrier within the case and slidably engaging the guideways for adjustment toward and away from the exposure-opening, and means mounted upon the carrier for supporting and feeding print-paper across the exposure-opening.

5. In a photographic-printing device, the combination of a case having an exposure-opening, a print-paper carrier comprising a paper-supporting table having opposite side members, a cross-bar connecting the side members and projected beyond the same, guideways upon the case with the ends of the cross-bar working therein, means for supporting a roll of print-paper upon one end of the carrier, a paper-receiving spool mounted upon the other end of the carrier, and means piercing the case and connected to the cross-bar for adjusting the carrier toward and away from the exposure-opening.

6. A photographic-printing device comprising a case having an exposure-opening, a print-paper carrier mounted within the case, and carrier-adjusting means piercing that side of the case which is opposite the exposure-opening and accessible at the exterior of the case for adjusting the carrier toward and away from the exposure-opening.

7. A photographic-printing device comprising a case having an exposure-opening, a print-paper carrier mounted within the case, and an adjusting-screw piercing that side of the case which is opposite the exposure-opening connected to the carrier for adjusting the latter toward and away from the exposure-opening.

8. In a photographic-printing device, the combination of a case having an exposure-opening, guideways within the case leading toward the exposure-opening, a print-paper carrier comprising a table having opposite side members, a cross-bar connecting the side members and projected beyond the same with its ends working in the guideways, an adjusting-screw piercing that side of the case which is opposite the exposure-opening and connected with the cross-bar for adjusting the carrier toward and away from the exposure-opening, means for rotatively supporting a spool of print-paper between the sides of the carrier at one end thereof, a paper-receiving spool mounted between the sides of the carrier at the opposite end thereof, and means for rotating the receiving-spool to feed print-paper across the table to the receiving-spool.

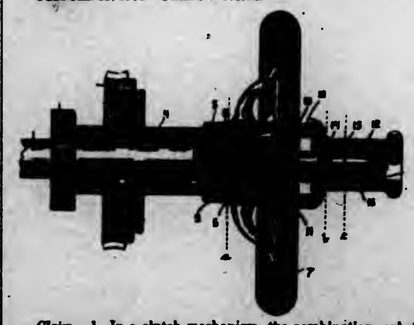
9. A photographic-printing device comprising a case having an exposure-opening, a print-paper carrier within the case, said case being provided with an opening to give access to the carrier, a closure-slide for the opening, said slide being provided with a sight-opening, and a transparent cover for the opening which is capable of excluding actinic rays of light.

10. A photographic-printing device comprising a case having an exposure-opening in one side and a pair of openings in the opposite side thereof and located at opposite sides of the middle of the case, a print-paper carrier within the case and provided opposite the openings with roll-holding means, closure-slides for the openings, one of the slides being provided with a sight-opening, and a transparent cover for the sight-opening which is capable of excluding actinic rays of light.

11. In a photographic-printing device comprising a case having an exposure-opening surrounded by an outwardly-directed flange, a light-excluding lining for the flange, and a negative-holder capable of being detachably received within the lined flange.

12. In a photographic-printing device, the combination of a case having an exposure-opening in the top thereof, a print-paper carrier within the case, a negative-holder capable of detachable application to the exposure-opening, a cut-off slide working through one side of the case between the paper-carrier and the exposure-opening, and the bottom of the case being provided with a slide-covered opening to give access to the paper-carrier.

812,817. **CLUTCH MECHANISM.** JOHN H. B. BRYAN, Buffalo, N. Y., assignor to Niles-Bement-Pond Company, Jersey City, N. J. Filed Jan. 21, 1904. Serial No. 190,042.



Claim.—1. In a clutch mechanism, the combination, substantially as set forth, of a shaft, a power-transmitting member loose thereon, a friction-clutch for coupling said loose member to the shaft, a nut threaded upon the shaft for setting the friction-clutch to active condition, a hand-wheel mounted on the nut, and a clutch serving to lock the hand-wheel directly to the shaft, whereby the hand-wheel may serve for turning the shaft within the loose power-transmitting member by hand and also for operating the friction-clutch to lock the power-transmitting member to the shaft.

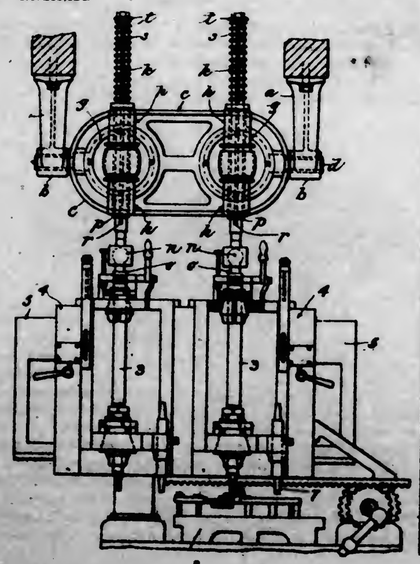
2. In a clutch mechanism, the combination, substantially as set forth, of a shaft, a power-transmitting member loose thereon, a friction-clutch for coupling said member to the shaft, a nut for setting the friction-clutch to active condition, a hand-wheel for turning the nut and mounted for rotation on the nut, coöperating lugs upon the nut and hand-wheel to serve in limiting their relative rotation, and a clutch to serve in connecting the hand-wheel directly with the shaft.

3. In a clutch mechanism, the combination, substantially as set forth, of a shaft, a power-transmitting member loose thereon, a friction-clutch for coupling said member to the shaft, a nut threaded on the shaft and provided with a lug, a hand-wheel for turning the nut and journaled loosely on the nut and provided with a lug to coöperate with the first-mentioned lug in limiting the relative rotation of the hand-wheel and the nut, said hand-wheel being provided also with a clutch member, a sleeve arranged for endwise adjustment on the shaft and provided with a clutch member to engage the clutch member of the hand-wheel, and a lug to prevent rotation of the sleeve upon the shaft when the sleeve is clutched to the hand-wheel.

4. In a clutch mechanism, the combination, substantially as set forth, of a shaft, a power-transmitting member loose thereon, a friction-clutch for coupling said member to the shaft, a nut threaded on the shaft and provided with a lug, a hand-wheel for turning the nut and journaled loosely on the nut and provided with a lug to coöperate with the first-mentioned lug in limiting the relative rotation of the hand-wheel and the nut, said hand-wheel being provided also with a clutch member on its outer face, a sleeve mounted for endwise and radial motion on the shaft outwardly beyond the hand-wheel and provided on its inner face with a clutch member to coöperate with the clutch member on the hand-wheel, said sleeve being provided also with an inwardly-facing notch, a lug projecting from the shaft and engaging an inner portion of the sleeve and preventing its inward movement except when coinciding with said notch, and a spring arranged to urge the sleeve toward the hand-wheel when said lug coincides with said notch.

5. In a clutch mechanism, the combination, substantially as set forth, of a shaft, two coöperating friction-clutch members thereon to engage by relative endwise movement of said members, a nut threaded on the shaft for producing such endwise movement, a hand-wheel for turning said nut and arranged for limited rotary motion relative thereto, and a pair of coöperating clutch members arranged to clutch the hand-wheel directly to the shaft when the first-mentioned clutch members are disengaged, whereby the hand-wheel may serve, alternatively, in actuating the first-mentioned clutch or in actuating the shaft directly.

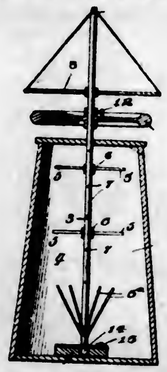
812,818. **DRIVING MECHANISM FOR PROFILING-MACHINES.** ERWIN W. BULLARD, Springfield, Mass. Filed May 26, 1904. Serial No. 209,994.



Claim.—1. In a driving mechanism for cutters of profiling-machines or the like, the combination of a one-piece spindle and a universal joint secured to one end thereof; a bearing for said spindle rotatable in one vertical plane, a support for said bearing rotatable in another vertical plane at right angles to the first, a pulley on the spindle located at the intersection of said two planes, the spindle being endwise movable in its bearings.

2. In a driving mechanism for cutters of profiling-machines or the like, the combination of a one-piece spindle and a universal joint secured to one end thereof; a bearing for said spindle rotatable in one vertical plane, a support for said bearing rotatable in another vertical plane at right angles to the first, a pulley on the spindle located at the intersection of said two planes, the spindle being endwise movable in its bearings, together with a counterbalancing device for the spindle.

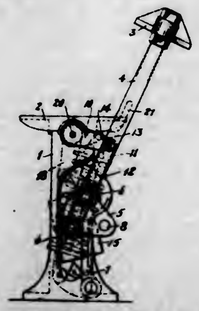
812,819. **CHURN-OPERATING MECHANISM.** HORACE L. BUSCH, De Queen, Ark. Filed Dec. 1, 1905. Serial No. 289,995.



Claim.—1. The combination of a churn, a dasher therefor consisting of a rotatable dasher-rod means for rotating said rod, a bearing for the lower end of the dasher-rod comprising a block removable from the churn, and a latch for detachably connecting the block with the dasher-rod.

2. In combination, a churn, a dasher comprising a dasher-rod provided at intervals in its length with recesses, a plurality of agitating-arms projecting from the dasher-rod, rings affixed to the dasher-rod and carrying the arms aforesaid, and set-screws passing through the rings and adapted to have the inner ends thereof received in the recesses on the dasher-rod.

812,820. **MOLDING-MACHINE.** CHARLES J. CALEY, New Britain, Conn., assignor to The Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Mar. 14, 1905. Serial No. 251,223.



Claim.—1. In a molding-machine, a table, a rammer, a pair of side arms carrying said rammer, a pivoted shaft, an arm-and-link connection from said shaft to said side arms, a curved guide, means carried by the lower end of said side arms for coöperating with said guide, means for operating said side arms, and means comprising

coöperating projecting and grooved parts for holding and guiding the upper portions of said side arms in a straight line without vibration when said side arms are brought into a vertical position.

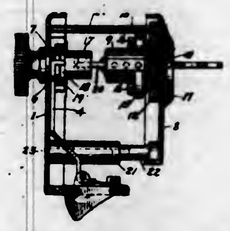
2. In a molding-machine, an oscillating yoke, means for moving it downward and forward, an interlocking rectilinear guide for said yoke consisting of a projecting male and an open-ended female part, one stationary and the other carried by the oscillating yoke, by which the yoke is guided rigidly during the effective part of its operating stroke.

3. In a molding-machine, the combination of a frame, a table, a pair of curved guides carried by said frame, a yoke, rollers carried by the lower ends of the arms thereof, coöperating with said guides, means for operating said yoke, and an interlocking rectilinear guide for said yoke comprising a projecting member and a grooved part adjacent the central portion of said yoke and brought into operation to prevent vibration during the effective portion of the ramming stroke.

4. In a molding-machine, a stationary frame, projections at the opposite sides thereof, an oscillating yoke, means for operating the same, the arms of said yoke having guideways 21 opening laterally for coöperating with said projections for the purpose specified.

5. In a molding-machine of the oscillating-yoke type, an interlocking rectilinear guide consisting of a projecting male and an open-ended female part, the one on the oscillating yoke, the other on the stationary or non-oscillating part of the machine, by which the ramming-yoke is guided rigidly during ramming.

812,821. **LOCK MECHANISM.** CHARLES J. CALEY and HENRY G. VOIGHT, New Britain, Conn., assignors to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed May 25, 1905. Serial No. 262,173.



Claim.—1. A lock mechanism, comprising inner and outer frame-plates adapted to be secured to the opposite sides of a door, latch-operating mechanism carried by one of said frame-plates, including two roll-backs, and a thumb-piece connected to one roll-back a cylinder-lock mechanism carried by the opposite frame-plate, means of connection between said cylinder-lock mechanism and the other roll-back and a guard-plate on the exterior of said last-mentioned frame-plate and having an opening with walls converging concentrically to the plug of said cylinder-lock.

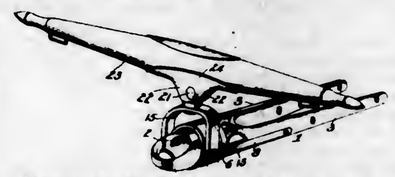
2. In a lock mechanism, the combination of an inner frame-plate, latch-operating mechanism carried thereby, an outer frame-plate, a cylinder-lock body having a screw-threaded portion, a plug, means of connection between said plug and said latch-operating mechanism a member mounted in said outer frame-plate having a screw-threaded portion engaging with the screw-threaded portion of said cylinder-body, means for preventing rotation of said member in said outer frame-plate, and means for clamping said cylinder-body and member in place in said outer frame-plate.

3. In a lock mechanism, the combination of inner and outer frame-plates, an operating-slide for the latch-bolt carried by the inner frame-plate, a thumb-piece mounted in said inner frame-plate and having a roll-back for coöperation with said slide, a cylinder-lock carried by said outer frame-plate in line with said thumb-piece, a shank and roll-back in line therewith adapted to coact with said slide, a spindle connection between said cylinder-lock and said shank, and means for aligning and positioning said inner and outer frame-plates.

4. In a lock mechanism, inner and outer frame-plates adapted to the opposite sides of a door, an end plate carried by one of said frame-plates, a latch-bolt operable therethrough, a slide carried by one of said frame-plates, a thumb-piece and roll-back for coöperating therewith, a cylinder-lock carried by the outer frame-plate, a spindle projecting therefrom in line with said thumb-piece, a roll-back controlled thereby independent of said first-mentioned roll-back and for coöperating with said latch-slide, and means for clamping said frame-plates in place.

5. In a lock mechanism, the combination of inner and outer frame-plates, a latch-bolt and operating-slide carried by one of said frame-plates, a thumb-piece carried by said inner frame-plate for operating said latch-slide, a cylinder-lock mechanism carried by the outer frame-plate with connections for operating said latch-slide, tubular members projecting from said inner frame-plate near the edge thereof, posts corresponding thereto and projecting from the outer frame-plate, screws coöperating therewith for drawing said frame-plates together, and an independent screw for drawing said frame-plates together and located at the rear of said thumb-piece and cylinder-lock.

812,822. **NECK-YOKE.** WILLIAM M. CARRIKER, Irving, Ill. Filed Jan. 14, 1905. Serial No. 241,027.



Claim.—1. In a device of the class described, the combination of a neck-yoke provided with a ring having an interior groove, a pole-tip receiving the ring, the latter being adapted for rotary movement on the former, and a catch carried by the pole-tip for engaging the annular groove of the ring.

2. In a device of the class described, the combination of a neck-yoke, a neck-yoke ring, an arched coupling member pivoted at opposite sides to the ring, and an upper coupling member pivoted to the top of the arched coupling member to permit the neck-yoke to swing horizontally, and also pivoted to the neck-yoke for enabling the same to swing transversely of the pole.

3. In a device of the class described, the combination with a neck-yoke, of a pole-receiving neck-yoke ring, an arched member pivotally connected to the ring at opposite sides thereof and arranged to swing longitudinally of the pole, and an upper coupling member mounted for rotation on the arched coupling member to permit the neck-yoke to swing horizontally, said upper coupling member being also pivoted to the neck-yoke, the pivot being arranged to permit the neck-yoke to swing laterally of the pole.

4. In a device of the class described, the combination of a pole-tip having an annular shoulder and provided with a longitudinal groove extending beneath the shoulder, said tip being also provided at the front end of the groove with a recess, and a catch operating in the recess and having a spring arranged in the groove and extending beneath the shoulder, and having its outward movement limited by the same.

5. In a device of the class described, the combination of a tip provided with an annular rib and having a longitudinal groove extending beneath the rib, said tip being also provided at the front end of the groove with a recess and having a socket in the front wall thereof, a spring arranged in the groove and extending into the socket, and a head mounted on the spring and spaced from the rib the latter being arranged to form a stop for limiting the outward movement of the spring.

6. In a device of the class described, the combination of a tip having an annular rib, catches located in advance of and spaced from the rib and provided with springs extending beneath and having their outward movement limited by the same, said catches being beveled at the front, and a neck-yoke having a ring arranged on the tip and engaged by the catches.

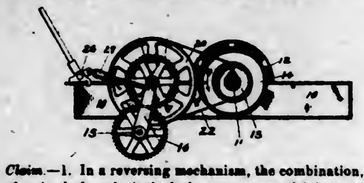
7. In a device of the class described, the combination of a neck-yoke having a ring provided with an interior groove, and means designed to be mounted on a pole and engaging the groove, said means permitting the ring to have a rotary movement on the pole and retaining the former on the latter throughout the entire rotary movement of the said ring.

8. In a device of the class described, the combination of a neck-yoke having a ring provided with an interior annular groove, and a catch extending into the groove for detachably retaining the ring on a pole, said catch permitting the ring to have a rotary movement on the pole.

9. In a device of the class described, the combination of a neck-yoke provided with a ring pivoted at its outer face at diametrically

opposite points and provided with an interior groove, and a catch designed to be mounted on a pole and engaging the groove of the ring and permitting it to have a rotary movement thereon and retaining the ring on the pole throughout the entire rotary movement of the former.

812,823. SAWMILL FEED-DRIVE. HARRY C. CLAY, Columbus, Ind., assignor to Reeves & Company, Columbus, Ind., a Corporation of Indiana. Filed Nov. 13, 1905. Serial No. 287,063.



Claim.—1. In a reversing mechanism, the combination, with a pair of main shafts, of a jack-shaft, a permanent driving connection between the first main shaft and the jack-shaft, and a belt-driving connection between the second main shaft and the jack-shaft, a frictional driving connection between the jack-shaft and the said second main shaft, and means for shifting the jack-shaft without destroying the driving connection between the same and the first main shaft to bring either the belt-drive or the friction-drive into action.

2. In a reversing mechanism, the combination, with a pair of main shafts, of a jack-shaft, a permanent driving connection between the first main shaft and the jack-shaft, and a belt-driving connection between the second main shaft and the jack-shaft, a frictional driving connection between the jack-shaft and the said second main shaft, means for shifting the jack-shaft without destroying the driving connection between the same and the first main shaft to bring either the belt-drive or the friction-drive into action, and means for normally holding the jack-shaft in a medial position.

3. In a reversing mechanism, the combination, with a pair of shafts, of a jack-shaft journaled in bearings pivoted upon the first of said shafts, a pair of meshing gears one carried by said first shaft and the other carried by the jack-shaft, a pair of friction elements one carried by the jack-shaft and the other by the second shaft, a belt-driving connection between the jack-shaft and said second shaft, and means for swinging the jack-shaft to bring either the friction-drive or the belt-drive into action.

4. In a reversing mechanism, the combination, with a pair of shafts, of a jack-shaft journaled in bearings pivoted upon the first of said shafts, a pair of meshing gears one carried by said first shaft and the other carried by the jack-shaft, a pair of friction elements one carried by the jack-shaft and the other by the second shaft, a belt-driving connection between the jack-shaft and said second shaft, means for swinging the jack-shaft to bring either the friction-drive or the belt-drive into action, and a yielding means for normally holding the jack-shaft in medial position.

812,824. WOOD-VENEERED METAL OBJECT. LEMUEL COBURN, Holyoke, Mass. Filed June 23, 1905. Serial No. 266,516.

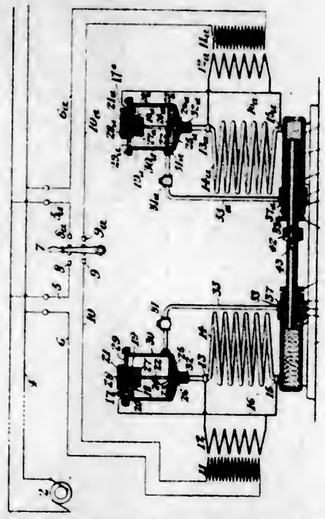
Claim.—1. A new article of manufacture consisting of a metal body with a surface finish of wood veneer applied thereto, and a binding element of practically non-absorbent material located between the metal and the veneer and adherent to both.

2. A structural material consisting of a metal body, a coating of wood veneer for the body, and a layer of non-absorbent flexible material interposed between the metal and the veneer and to which both metal and veneer are adherent.

3. A structural material consisting of a metal body, a coating of wood veneer therefor, and a layer of non-absorbent paper interposed between the metal and the veneer, and to which both metal and veneer are adherent.

812,825. RAILWAY-SWITCH-OPERATING APPARATUS. OTTO J. CHAMBAT, Roseburg, N. J., assignor of one-half to Sidney Arendale, New York, N. Y. Filed Feb. 4, 1905. Serial No. 244,333.

Claim.—1. The combination of a railway-track switch, caloric motive apparatus in actuative coöperation therewith, and electrocaloric-energy-transmuting apparatus arranged to supply caloric energy to the caloric motive apparatus.



2. The combination of a railway-track switch and electrocaloric fluid-pressure motive apparatus in actuative coöperation with the switch and including electrocaloric-energy-transmuting means arranged to heat the motive fluid of the motive apparatus.

3. The combination of a railway-track switch and electrocaloric motive apparatus in actuative coöperation with the switch and including an electric conductor adapted to be heated by electric current and to thereby develop caloric energy for operating the caloric motive apparatus.

4. Railway-track-switching means comprising, in combination, a track-switch, caloric fluid-pressure motive apparatus in actuative coöperation therewith, and an electric conductor arranged to be heated by electric current and to supply heat to the motive fluid of the motive apparatus.

5. The combination, with a railway-track switch, of electrocaloric fluid-pressure motive apparatus arranged to actuate the switch and comprising an electrical conductor provided with a receiving-space for the motive fluid of the motive apparatus and adapted to be heated by electric current and to transmit heat to the motive fluid.

6. The combination, with a railway-track switch, of caloric fluid-pressure motive apparatus arranged to operate the switch, and a tubular electrical conductor adapted to receive the motive fluid of the motive apparatus and to transmit to such motive fluid the heat generated in the tubular conductor by flow of electricity therein.

7. Railway-switch-operating apparatus comprising fluid-pressure motive apparatus in actuative coöperation with a track-switch and including an expansible motive chamber and a tubular electric conductor in fluid communication with the motive chamber and arranged to receive motive fluid and to heat and expand the same by caloric energy generated by passage of an electric current in the tubular conductor.

8. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative control of a track-switch and including a motive chamber expansible by pressure of motive fluid and provided with a relief-passage, electrocaloric-energy-transmuting means arranged to heat and expand the motive fluid of the motive apparatus so as to effect a motive expansion of the motive chamber, and means for opening the relief-passage from such motive chamber after occurrence of its motive expansion.

9. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative coöperation with a railway-track switch and including a motive chamber expansible by pressure of motive fluid and a relief-passage for such motive chamber, electrocaloric-energy-transmuting means arranged to supply caloric energy for effecting a motive expansion of the motive fluid and of the motive chamber, and means for maintaining closure of the relief-passage during a given motive expansion of the chamber.

10. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative coöperation with a railway-track switch and including a motive chamber expansible by pressure of motive fluid and provided with a relief-passage, electrocaloric heating means arranged to heat the motive fluid of the motive apparatus so as to expand such motive fluid and thereby effect a motive expansion of the motive chamber, and means for maintaining the relief-passage in closed condition during the motive expansion of the chamber and for opening such relief-passage after such motive expansion.

11. Railway-switch-operating means comprising fluid-pressure motive apparatus including a fluid-pressure motive chamber expansible by pressure of the motive fluid of the motive apparatus and arranged in actuative coöperation with a track-switch and such motive apparatus including also an electrically-controllable relief-passage in communication with the motive chamber, electrothermal heating means arranged to heat and expand the motive fluid of the motive apparatus and thereby effect a motive expansion of the motive chamber, and a common source of electricity arranged to supply electrical energy both for the electrothermal heating means and for control of the electrically-controllable relief-passage.

12. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus including a motive expansion-chamber operatable by pressure of the motive fluid of the motive apparatus and arranged in actuative control of a track-switch, in combination with an electrically-controllable relief-passage communicating with the motive chamber, a relief-controlling electric circuit for the relief-passage and arranged to maintain closure of such relief-passage by flow of current in such relief-controlling circuit, electrothermal heat-producing means arranged to heat and expand the motive fluid and thereby actuate the motive chamber and operate the track-switch, and a common source of electricity arranged to supply electric current simultaneously to the electrothermal heating means and to the relief-controlling circuit.

13. A railway-switch-controlling system including, in combination, a railway-track switch, caloric motive apparatus in actuative coöperation with the track-switch, and an electric circuit in controlling relation to the caloric motive apparatus.

14. A railway-switch-controlling system comprising a railway-track switch, caloric motive apparatus in actuative coöperation therewith, electrocaloric-energy-transmuting means arranged to supply caloric energy to the caloric motive apparatus, and an electric circuit arranged both to supply electrical energy for the electrocaloric-energy-transmuting means and to control actuation of the track-switch by the caloric motive apparatus.

15. A railway-switch-controlling system comprising a railway-track switch, caloric fluid-pressure motive apparatus in actuative coöperation with the track-switch, electrocaloric heating means arranged to heat the motive fluid of the fluid-pressure motive apparatus, and an electric circuit arranged to supply electrical energy to the electrocaloric heating means and also arranged to control actuation of the track-switch by the caloric fluid-pressure motive apparatus.

16. Railway-switch-operating means comprising a fluid-pressure motive chamber expansible by pressure of motive fluid and arranged to actuate a track-switch by its motive expansion, an electrically-conductive fluid-heating tube having fluid communication with the motive chamber and adapted to expand the motive fluid by heat of an electric current so as to effect a motive expansion of the motive chamber, a fluid-relief passage leading from the heating-tube, and means for maintaining closure of the relief-passage during the motive expansion of the motive chamber.

17. Railway-switch-operating means comprising fluid-pressure motive apparatus including a motive chamber expansible by pressure of motive fluid and arranged to actuate a track-switch by its motive expansion and such motive apparatus including also a reservoir and a relief-passage leading from the motive chamber to the reservoir, electrocaloric-energy-transmuting means arranged to supply caloric energy to the motive fluid of the fluid-pressure motive apparatus to effect motive expansion of its motive chamber, and means for maintaining closure of the relief-passage during such motive expansion of the motive chamber.

18. Railway-switch-operating means including a fluid-pressure motive expansion-chamber, a leakage-fluid-receiving chamber, a power-transmitting rod passing through the leakage-fluid-receiving chamber and into the motive expansion-chamber, a tight sliding joint through which the rod enters the leakage-fluid-receiving chamber, a second tight sliding joint through which the rod passes from the leakage-fluid-receiving chamber into the motive expansion-chamber, a conduit connecting the leakage-fluid-receiving chamber with a receiving-reservoir, a relief-passage affording fluid communication between the motive expansion-chamber and the reservoir, means for increasing the pressure of the motive fluid in the motive expansion-chamber whereby to move the power-transmitting rod, means for maintaining closure of the relief-passage during such movement of the rod, and means for transmitting the movement of the power-transmitting rod to a track-switch.

19. Railway-switch-operating means comprising fluid-pressure motive apparatus in actuative connection with a railway-track switch and including a fluid-pressure motive expansion-chamber arranged to move the track-switch by its motive expansion, an electroconductive fluid-heating tube in fluid communication with the motive expansion-chamber, a fluid-reservoir, a controllable relief-passage affording controllable fluid communication between the electroconductive fluid-heating tube and the relief-reservoir, means for passing an electric current through the electroconductive fluid-heating tube whereby to heat the tube and the motive fluid contained therein and effect a motive expansion of such fluid and of the motive chamber, and means for maintaining closure of the relief-passage during the motive expansion of the motive chamber.

20. Railway-switch-operating means comprising fluid-pressure motive apparatus in actuative connection with a railway-track switch and including, in a closed motive-fluid-containing system, a fluid-pressure motive expansion-chamber arranged to move the track-switch by its motive expansion, an electroconductive fluid-heating tube in fluid communication with the motive expansion-chamber, a fluid-reservoir permanently closed against communication with the outer atmosphere, a controllable relief-passage affording controllable fluid communication between the electroconductive fluid-heating tube and the closed relief-reservoir, means for passing an electric current through the electroconductive fluid-heating tube whereby to heat the tube and the motive fluid contained therein and effect a motive expansion of such fluid and of the motive chamber, and means for maintaining closure of the relief-passage during the motive expansion of the motive chamber.

21. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative connection with a track-switch and including a motive expansion-chamber operatable by pressure of the motive fluid of the apparatus to actuate the track-switch, and a tubular electric conductor of helical form in fluid communication with the motive expansion-chamber and adapted to be heated by an electric current and to heat and expand the motive fluid of the motive apparatus so as to effect a motive expansion of the motive chamber and thus actuate the track-switch.

22. Railway-switch-operating means comprising a fluid-pressure motive expansion-chamber, means for transmitting the power of a motive expansion of the motive chamber to a track-switch, an electroconductive fluid-heating tube of helical form in fluid communication with the motive chamber and adapted to be heated by electric current and to heat the motive fluid of the motive apparatus and effect a motive expansion of such fluid and of the motive chamber, a controllable relief-passage leading from the heating-tube, and means for maintaining closure of the relief-passage during the motive expansion of the motive chamber.

23. Railway-switching means comprising a railway-track switch, caloric fluid-pressure motive apparatus arranged in actuative relation thereto and including a motive-fluid-containing system closed from communication with the outer atmosphere, and electrocaloric-energy-transmuting means arranged to supply caloric energy to the motive fluid of the caloric fluid-pressure motive apparatus.

24. Railway-switch-operating means comprising switch-actuating motive apparatus operatable by caloric energy and including an electrical heating-conductor adapted to be heated by electric current and to supply the caloric energy for operating the motive apparatus, in combination with a transformer arranged to deliver its secondary current to the heating-conductor, and a current-transmitting circuit arranged to deliver primary current to the transformer.

25. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative connection with a track-switch and including a motive chamber expansible by pressure of the motive fluid of the motive apparatus and arranged to move the track-switch in one direction by its motive expansion, electrocaloric heating means arranged to heat the motive fluid of the motive apparatus so as to increase its pressure and effect a motive expansion of the motive chamber, and means for returning the motive chamber and the track-switch to initial condition and position after the motive expansion of the motive chamber.

26. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative connection with a track-switch and including two motive expansion-chambers arranged to move the track-switch into opposite positions by their respective mo-

tive expansions and each motive chamber being also arranged to restore the other motive chamber to its normal or unexpanded condition, and the caloric fluid-pressure motive apparatus also including

pipe 13 communicating with both said compartments and leading into chamber B, waste-pipe 10 open to chamber B above the level of

3. In a lock and latch mechanism the combination of the casing having a front plate and side plates, a latch-slide and separate latch-

tive expansions and each motive chamber being also arranged to restore the other motive chamber to its normal or unexpanded condition, and the caloric fluid-pressure motive apparatus also including separate motive-fluid-containing systems for the motive fluids of the separate motive expansion-chambers, and means for independently heating and expanding the motive fluids of the independent containing systems.

27. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative connection with a track-switch and including two motive expansion-chambers arranged to move the track-switch into opposite positions by their respective motive expansions and each motive chamber being also arranged to restore the other motive chamber to its normal or unexpanded condition, and the caloric fluid-pressure motive apparatus also including separate motive-fluid-containing systems for the motive fluids of the separate motive expansion-chambers, and independent electrocaloric-energy transmuters arranged to heat and expand the motive fluids of the independent motive-fluid-containing systems.

28. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus arranged to actuate a track-switch by motive expansion of the motive fluid of the motive apparatus, electrocaloric-energy-transmuting means arranged to supply caloric energy to the motive fluid to effect motive expansion of the same, and cooling means arranged to dissipate the caloric energy of the motive fluid.

29. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus arranged to actuate a track-switch by motive expansion of its motive fluid, an electrocaloric-energy transmuter, and cooling means, the electrocaloric-energy transmuter and the cooling means being arranged to alternately supply and dissipate caloric energy to and from the motive fluid of the motive apparatus to effect motive expansion of the motive fluid and to permit a contraction of such motive fluid between successive motive expansions thereof.

30. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus arranged to actuate a track-switch by motive expansion of its motive fluid and including an electric heating-conductor provided with a motive-fluid-receiving space arranged to contain motive fluid of the motive apparatus and such conductor being adapted to heat the motive fluid by caloric energy of an electric current flowing through the conductor and also to cool the motive fluid by absorption of heat therefrom.

31. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus arranged to actuate a track-switch by motive expansion of its motive fluid and having a motive-fluid-containing system including a tubular electric conductor arranged to be heated and to heat the motive fluid by passage of an electric current whereby effect motive expansion of the motive fluid and also arranged to absorb and dissipate heat of the motive fluid so as to permit a contraction thereof subsequent to its motive expansion.

32. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus in actuative coöperation with a track-switch and including a motive expansion-chamber arranged to actuate the track-switch by motive expansion of the motive fluid of the apparatus, and a helical electroconductive tube in fluid communication with the motive chamber and arranged to contain motive fluid and to heat and expand the same by caloric energy of an electric current passing through such electroconductive tube, and such tube being also arranged to absorb and dissipate the heat of the motive fluid.

33. Railway-switch-operating means comprising caloric fluid-pressure motive apparatus arranged to move a track-switch into a given position by motive expansion of the motive fluid of the apparatus, electrocaloric-energy-transmuting means arranged to supply caloric energy to the motive fluid of the caloric fluid-pressure motive apparatus, an electric circuit arranged to supply electrical energy to the electrocaloric-energy-transmuting means and also arranged to control actuation of the track-switch by the motive apparatus, a second caloric fluid-pressure motive apparatus arranged to move the track-switch into another position by motive expansion of the motive fluid of such second motive apparatus, a second electrocaloric-energy-transmuting means arranged to supply caloric energy to the motive fluid of the second motive apparatus, and a second electric circuit arranged to supply electrical energy to the second electrocaloric-energy-transmuting means and also arranged to control actuation of the track-switch by the second motive apparatus.

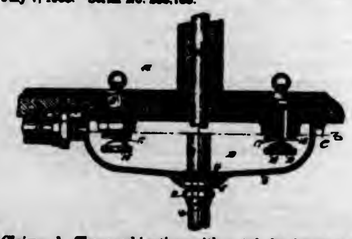
34. Railway-switch-operating means comprising switch-actuating caloric motive apparatus, electrocaloric-energy-transmuting means arranged to supply caloric energy to the caloric motive apparatus, an electric-current transformer arranged to deliver its secondary current to the electrocaloric-energy-transmuting means, and an electric transmission-circuit arranged to deliver primary current to the transformer.

35. Railway-switch-operating means comprising fluid-pressure motive apparatus arranged to actuate a track-switch by motive expansion of its motive fluid and including electroconductive motive fluid expansible by passage of an electric current through it, and means for conducting electricity through the motive fluid of the motive apparatus so as to effect a motive expansion thereof.

36. Railway-switch-operating means comprising fluid-pressure motive apparatus arranged to actuate a track-switch by pressure variation in its motive fluid and including a liquid motive fluid adapted for conversion into gaseous form by passage of electricity through such liquid, and means for passing electricity through the liquid so as to convert the same to gaseous form and thereby vary its pressure to actuate the track-switch.

37. Railway-switch-operating means comprising fluid-pressure motive apparatus arranged to actuate a track-switch by motive expansion of its motive fluid and including a motive fluid expansible by passage of electricity through it, and means for passing electricity through the motive fluid of the motive apparatus to effect a motive expansion thereof and actuate the track-switch.

812,826. **TUB.** PATRICK CONNOLLY, Brooklyn, N. Y., assignor to Frank B. Connolly, Brooklyn, N. Y. Filed June 15, 1904. Renewed July 7, 1905. Serial No. 268,728.



Claim.—1. The combination with a tub having two or more compartments, of a chamber beneath the tub formed by detachably securing a casing *b* to the under side of the tub, outlets leading from said compartments to said chamber, and a waste-pipe leading from said chamber, substantially as described.

2. The combination with a tub having two or more compartments, of a chamber beneath the tub formed by detachably securing a casing *b* to the under side of the tub, outlets leading from said compartments to said chamber, check-valves on said outlets to prevent backflow, and a waste-pipe leading from said chamber, substantially as described.

3. The combination with a tub having two or more compartments, of a chamber beneath the tub formed by detachably securing a casing *b* to the under side of the tub, outlets leading from said compartments to said chamber, and a waste-pipe leading from said chamber at a higher level than the openings of said outlets into the chamber, substantially as described.

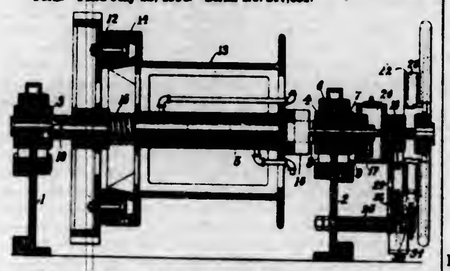
4. The combination with a tub having two or more compartments, of a chamber beneath the tub formed by detachably securing a casing *b* to the under side of the tub, outlets leading from said compartments to said chamber, check-valves on said outlets to prevent backflow, and a waste-pipe open to said chamber at a higher level than the openings of said outlets into the chamber, substantially as described.

5. In combination with a tub, of a chamber beneath the tub formed by detachably securing a casing *b* to the under side of the tub, an outlet leading from the tub to the chamber, a check-valve on said outlet to prevent backflow, and a waste-pipe open to the chamber at a higher level than the opening of said outlet into the chamber, substantially as described.

6. The combination with a tub having two or more compartments, of a chamber B formed by detachably securing a casing *b* to the under side of the tub, outlet-pipes 11 and 12 leading from said compartments into said chamber, overflow-pipe 13 communicating with both compartments and leading into said chamber, and waste-pipe 10 open to said chamber above the level of the openings of pipes 11, 12 and 13, substantially as described.

7. The combination with the tub A having compartments *a* and *a'*, of chamber B formed by securing a casing *b* to the under side of the tub A, outlet-pipes 11 and 12 leading from said compartments into chamber B, check-valves 15 and 16 carried by rods 17, overflow-pipe 13 communicating with both said compartments and leading into chamber B, waste-pipe 10 open to chamber B above the level of the openings of pipes 11, 12 and 13, and a vent-pipe leading from said chamber, substantially as described.

812,827. **BRAKE-BAND.** HARRY H. COVELL, New York, N. Y., assignor to Lidgerwood Manufacturing Company, a Corporation of New York. Filed July 28, 1904. Serial No. 217,051.



Claim.—1. The combination with friction clutch members of a device for setting said members in driving contact and means independent of the setting mechanism automatically operating to retain said device and clutch members in driving contact.

2. The combination with friction clutch members of a device for setting said members in driving contact, means independent of the setting mechanism automatically operating to hold said device and clutch members in set position, and means whereby said device may be released to permit the unsetting of said clutch members.

3. The combination with friction clutch members, of a device for setting said members in driving contact, and a brake-band whereby said device is free to turn in one direction and held from turning in the opposite direction.

4. In combination with friction clutch members, a wheel for setting said members in driving contact, a brake-band thereon permitting the turning of said wheel to set said members and automatically operating to restrain said wheel from turning in the reverse direction.

5. The combination with friction clutch members, of a device free to turn to set said members in driving contact, a brake-band whereby said device is restrained from turning in the reverse direction and means whereby said brake-band may release said device to turn in the opposite direction.

6. The combination with friction clutch members of a device for setting said members in driving contact, a brake-band thereon normally holding said members in set position and means whereby said brake-band may release said device and permit the unsetting of said members.

7. The combination with friction clutch members, of a device for setting said members in driving contact, a brake-band thereon normally holding said device from backward turning, and a treadle for releasing said brake-band thereby permitting the turning of said device in reverse direction.

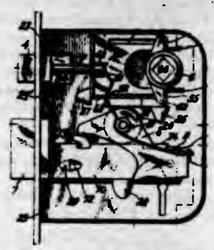
8. The combination with friction clutch members, of a device for setting said members in driving contact, and a brake-band thereon, the ends of said brake-band being attached to a lever, said brake-band normally holding said device in set position until released by action upon said lever.

812,828. **LOCK AND LATCH MECHANISM.** NATHAN W. CRANDALL, New Britain, Conn., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed June 10, 1904. Serial No. 211,893.

Claim.—1. In a lock and latch mechanism the combination of a case having two side plates of sheet metal with flanges, a boss and a seat carried by one of said side plates, a screw for coöperating with said seat and connecting said plates, an integral lug stamped from one of said side plates, a latch-slide guided between one of said flanges at one edge and said boss and said lug at the other edge.

2. In a lock and latch mechanism the combination of a casing formed of sheet metal, an integral lug stamped from the metal of one of the side plates, a latch-slide guided in said case, said lug acting as a stop to limit the outward movement of said slide and being reinforced by its connection with said plate opposite the engaging edge.

3. In a lock and latch mechanism the combination of the casing having a front plate and side plates, a latch-slide and separate latch-bolt adapted to be retracted by said slide, said bolt being also movable independently of said slide, a spring for normally holding said latch-bolt in its extended position, said casing having a recess in one of its side plates affording a guide for said latch-bolt, the rear end of said recess forming a shoulder limiting the inward movement of said latch-bolt.



4. In a lock and latch mechanism the combination of a casing having one side formed of sheet metal, a latch-bolt, a slide, means for operating the same, an integral lug stamped from the metal of one side plate and forming a lateral guide for the shank of said latch-bolt.

5. In a lock and latch mechanism the combination of a casing, a latch-bolt, a slide, guiding means for said slide, and integral tracks stamped from the metal of said slide to coöperate with one of the said plates of said case.

6. In a lock and latch mechanism the combination of a casing, a latch-bolt and slide, a roll-back, flanges integral with said slide with which said roll-back coöperates and integral reinforcing-lugs for said flanges which also coöperate with said case.

7. In a lock and latch mechanism, the combination of a face-plate and side plates having flanges, one of said side plates being formed of sheet metal and having reinforcing and stiffening lugs at two corners uniting the side plate and the adjacent flange and secured to said face-plate.

8. In a lock and latch mechanism, the combination of a face-plate and side plates having coöperating flanges, one of the said side plates being formed of sheet metal and having lugs secured to the back of said face-plate and integral with said side plate and at right angles to its flange for the purpose specified, the other side plate also being formed of sheet metal, said lugs coacting with and inclosing its flanges to seat the same and means for securing the side plates together.

9. In a lock and latch mechanism, the combination of a case, a locking-bolt having a shank formed of sheet metal, guides therefor, an integral lug stamped from the metal of said shank and sliding on one of said side plates and stops to limit the movement of said bolt.

10. In a lock and latch mechanism the combination of a casing having one side formed of sheet metal, a locking-bolt, guides therefor, and integral lugs formed by stamping up the metal of said side plate and a corresponding lug formed by indenting the metal of said bolt-shank to operate as a stop.

11. In a lock and latch mechanism the combination of a casing formed with two side plates, a boss and seat carried by one of said side plates, a screw for coöperating with said seat and holding said side plates together, a locking-bolt, a lug formed by stamping up the metal of one of said side plates, said bolt being guided between said boss and said lug.

12. In a lock and latch mechanism the combination of a casing formed with two side plates, a boss carried by one of said plates, a locking-bolt, a tumbler mounted on said boss, a spring therefor and a lug integral with said tumbler and coacting with one of said side plates, said spring coöperating with said lug.

13. In a lock and latch mechanism the combination of the casing having a front plate and side plates, a boss and a post carried by one of said plates, a tumbler pivotally mounted on said post and positioned by said boss, a locking-bolt, shoulders formed in the shank of said locking-bolt in front of and to the rear of said post, lugs projecting from said tumbler, adapted to coact with said shoulders, and a spring for normally holding said tumbler with one of its lugs engaging the rear shoulder of said bolt when the same is extended, said casing having a keyhole opening beneath said tumbler and beneath said bolt, all for the purpose specified.

14. In a lock and latch mechanism the combination of a case, a latch-bolt, a slide separate therefrom, a locking-bolt, a tumbler therefor and a single spring coöperating with said latch-bolt and said tumbler to hold them in their proper positions and adapted to coöperate with said latch-slide when the same is retracted and to

812,830. **WEIGHING DEVICE.** HENRY E. DAHLMAN, Burlington, Wis. Filed Aug. 26, 1905. Serial No. 275,022.

3. The combination with a casing having at its lower portion a liquid-inlet [illegible] operating seat located therein for controlling the discharge of such

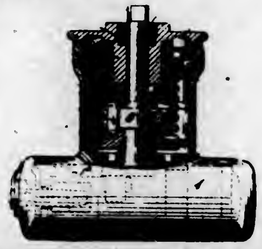
said tumbler to hold them in their proper positions and adapted to cooperate with said latch-slide when the same is retracted and to throw the same outward independent of said latch-bolt.

15. In a lock and latch mechanism the combination of a case, a latch-slide, means for retracting the same, a latch-bolt adapted to be retracted by said latch-slide but having an independent movement with relation thereto and a single spring having a long arm adapted to engage said latch-bolt and a shorter arm adapted to engage said latch-slide whereby the same spring affords less resistance to the retraction of said latch-bolt than to the retraction of said latch-slide.

16. In a lock and latch mechanism the combination of a case, a latch-bolt, a slide having an upturned flange engaged by the shank of said latch-bolt, and a lug integral with said latch-slide reinforcing said flange and a spring for coacting with said lug to operate said latch-slide.

17. In a lock mechanism the combination of a case formed in two parts, a raised boss, a seat projecting beyond said boss but secured to one part of said case, a screw for taking into said seat and securing the parts of said case together, a locking-bolt, and a tumbler pivoted on said seat and positioned by said boss.

812,829. **DOOR CHECK AND CLOSER.** NATHAN W. CRANDALL, New Britain, Conn., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Oct. 5, 1904. Serial No. 227,196.



Claim.—1. In a liquid door check and closer, a case including a piston-chamber and a spring-chamber, checking mechanism including a piston, and closer mechanism including a spring, all contained within said case, a spindle connected to both said piston and said spring, a removable lower spindle-bearing between the spring-chamber and piston-chamber, a communicating passage between said chambers, a removable upper spindle-bearing projecting downwardly into the spring-chamber, a spring-controlled dog rotatably mounted upon said upper spindle-bearing, an air-chamber formed between said upper dog and said upper bearing, and backflow-ports connecting said space with the interior of said spring-chamber.

2. In a device of the character described, a spindle, a double-acting spring, independently-movable dogs indirectly connecting the spring with said spindle, one of said dogs being formed of two members one adjustable relatively to the other, said spring being connected directly with the adjustable member of said dog and a rotatable adjusting device comprising a snail carried by one of said members and coacting with the other.

3. In a device of the character described, a spindle, a spring, independently-movable dogs indirectly connecting the spring with said spindle, one of said dogs being formed of two members one adjustable relatively to the other, said spring being connected directly with the adjustable member of said dog, and a self-locking adjusting device carried by one of said members and engaging the other.

4. In a device of the character described, a spring, a spring tension-adjusting device comprising a rotatable member, a dog, a sleeve mounted thereon and rotatable relatively thereto, a projection or lug on said sleeve arranged to be directly connected with said spring, a toothed flange on said sleeve, a snail carried by said dog and engaging said toothed flange whereby the rotation of the snail will shift the angular position of said sleeve relatively to its support.

5. In a device of the character described, a casing forming a spring-chamber, a spindle-bearing in the lower part thereof, another spindle-bearing in the upper part thereof, a spindle supported by said bearings, a dog fixed on said spindle, two movable dogs carried by said spindle, and coöperating with the fixed dog, a spring directly connected with one of said movable dogs and adjustably and indirectly connected with the other of said movable dogs and means within said casing for varying the adjustment of said spring with the last mentioned dog.

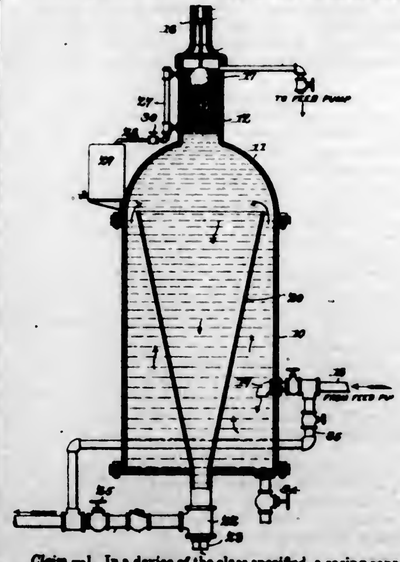
812,830. **WEIGHING DEVICE.** HENRY B. DAHLMAN, Burlington, Wis. Filed Aug. 28, 1905. Serial No. 276,023.

Claim.—1. A weighing device, comprising a casing provided with exterior index-slides; elbow-levers within the casing, each having one arm operatively connected with one of the index-slides; a weight-supporting bail extending through the casing and loosely connected with the other arms of the elbow-levers, and a tension device operatively connected with the elbow-levers and adapted to pull thereon in opposition to the pull of the bail.

2. In a device of the described class, the combination of a casing; an elbow-lever pivotally mounted therein; an index-slide normally mounted on the exterior surface of the casing and operatively connected with one arm of the elbow-lever; a bail connected with the other arm of said lever; and a tension device operatively connected with the lever to act in opposition to the pull exerted by the bail.

3. In a device of the described class, the combination of a casing; a set of elbow-levers pivotally mounted in the casing and provided with inwardly and upwardly projecting arms extended through slots in the casing; index-slides movably mounted on the exterior surface of the casing and operatively connected with said projecting arms; a spring connecting said arms within the casing; and a weight-supporting bail extending through said casing longitudinally and loosely connected with the other arms of the respective elbow-levers; said levers being positioned to receive a pull upon the bail in opposition to the tension of said spring.

812,831. **OIL AND FEED-WATER SEPARATOR.** GEORGE R. DAVIDSON, Lenox, Mich. Filed Mar. 9, 1905. Serial No. 249,292.



Claim.—1. In a device of the class specified, a casing connected between the feed-pump and the boiler, a submerged deflector by which the water is directed toward the upper end of the casing in a thin annular stream, a water-outlet at or near the bottom of the casing, and means at the top of the casing for drawing off the accumulated oil.

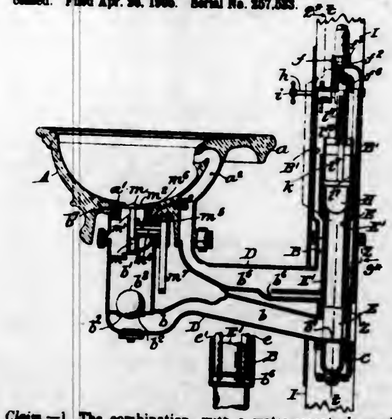
2. In a device of the class specified, a casing having an inlet at its lower portion for the liquid to be separated, a submerged conical deflector arranged within the casing and over the upper wider edge of which the liquid must pass, and a water-outlet leading from the lower portion of said deflector, and means at the top of the casing for drawing off accumulated oil.

3. The combination with a casing having at its lower portion a liquid-inlet, a submerged funnel-shaped deflector arranged within the casing and forcing the volume of fluid to travel in a thin annular stream between the upper wider mouth of the deflector and the inner wall of the casing, a water-outlet near the lower end of the deflector, an oil-chamber forming an extension of the main casing and to which the oil flows by gravity, and means for drawing off the oil from said chamber.

4. The combination with a casing having near its lower end an inlet for the liquid to be separated, said inlet having a downwardly-turned discharge-mouth, a submerged funnel-shaped deflector arranged within the casing and having its widened inlet-mouth near the upper portion of said casing, a water-discharge near the lower end of said deflector, an upper oil-chamber forming an extension of the main casing, and to which the oil flows by gravity, a sight-glass for determining the quantity of oil in said chamber, and means for drawing off said oil.

5. In a device of the class specified, a casing having at its upper end an air-vent, a float-valve for closing said air-vent, an inlet arranged near the lower portion of the casing for the entrance of the liquid to be separated, a submerged deflector having a widened entrance-mouth and a contracted discharge-opening, an oil-chamber arranged at the upper portion of the casing and through which the oil flows by gravity, and means for drawing off the oil from said chamber.

812,832. **LAVATORY-FIXTURE.** ELIPHALET DE CAMP and FRANK P. CAUFIELD, Newark, N. J., executors of Allen P. Croque, deceased. Filed Apr. 26, 1905. Serial No. 257,533.



Claim.—1. The combination, with a water-receptacle, and a vessel connected therewith, to which the water in being supplied to the receptacle also flows, of a trap through which the water supplied to the receptacle and vessel is discharged, and separate means for controlling the discharge of the water from such receptacle and from such vessel, substantially as described.

2. The combination, with a water-receptacle, and a vessel from which it is supported and to which the water in being supplied to the receptacle also flows, of a trap through which the water supplied to the receptacle and vessel may be discharged, and valves m and E and coöperating valve-seats by which the discharge of the water from the receptacle and vessel into the trap is controlled, substantially as described.

3. The combination, with a water-receptacle, and a vessel provided with a bracket-arm upon which the water-receptacle is mounted, of tubular connections between the receptacle and vessel through which water supplied to the one may flow to the other, a trap to which the receptacle and vessel are connected, and valves m and E and coöperating valve-seats through which the discharge of the contents of the receptacle and vessel into the trap may be controlled, substantially as described.

4. The combination, with a water-receptacle, and a vessel adapted to be firmly secured in the walls of a room or apartment and provided with a bracket-arm upon which the receptacle is mounted, of a tubular connection between the receptacle and vessel through which water supplied to the one may flow to the other, a trap, connection between the receptacle and trap through which the contents of the receptacle may be discharged into the trap, a valve E and coöperating seat located therein for controlling the discharge of such contents thereinto, and a second valve and seat, which, while permitting of the free flow of the contents from the receptacle, prevents the emptying of the trap by siphonic action when such contents is discharged, substantially as described.

5. The combination, with a water-receptacle, and a trap, of a chamber into which the contents of the receptacle are discharged provided with a valve-seat, a pipe leading from this valve-seat to the trap, a buoyant valve located within the chamber for coöperation with the valve-seat to prevent the emptying of the trap by siphonic action, and a second valve and seat for controlling the flow of the contents of the receptacle therefrom, substantially as described.

6. The combination, with a water-receptacle, and a trap, of a chamber into which the contents of the receptacle are discharged provided with a valve-seat in its bottom, a connection between this valve-seat and the trap for conducting the contents of the receptacle to the trap, a buoyant valve located within the chamber for coöperation with the valve-seat, and a valve and seat located within the connection between the chamber and the trap for controlling the retention and discharge of the contents of the receptacle within and from the same, substantially as described.

7. The combination, with a water-receptacle provided with a discharge-orifice, a vessel, a tubular connection between the receptacle and vessel through which water supplied to the one may flow to the other, and a trap to which the tubular lower end of the vessel is connected, of tubular connections between the discharge-orifice of the receptacle and the lower tubular portion of the vessel, a valve-seat located in the lower end of the tubular vessel below the entrance of the tubular connection leading from the discharge-orifice of the receptacle thereto, a tubular valve for coöperating with such seat, means by which this tubular valve may be raised from and closed upon its seat and means by which the orifice through the tubular valve may be opened and closed, substantially as described.

8. The combination, with a water-receptacle provided with a discharge-orifice, a closed vessel with which the receptacle is connected and to which the water is being supplied to the receptacle also flows, and a trap through which the contents of the receptacle and vessel may be discharged, of a tubular connection leading from the discharge-orifice of the receptacle to the trap, a valve-seat b^4 located in this tubular connection, a tubular valve E for coöperation with such valve-seat and itself provided with a valve-seat e, means by which this tubular valve may be operated, a tubular guide in which such tubular valve is fitted to slide, a valve H for coöperation with the valve-seat o, and means by which this valve H may be operated, substantially as described.

9. The combination with a water-receptacle provided with a discharge-orifice, a vessel with which the receptacle is connected and to which the water is being supplied to the receptacle also flows, a passage-way through which the contents of the receptacle and vessel may be discharged, a valve-seat b^4 arranged in connection therewith, a tubular valve for coöperating with this valve-seat, a tubular guide in which this last-mentioned valve is fitted to slide, means by which the orifice through such tubular valve may be opened and closed, and a dam arranged in connection with the tubular guide, whereby when the contents of the receptacle and vessel rises to a predetermined height it will flow over said dam and pass downward through the tubular valve to the place of discharge and thereby prevent the overflow of the receptacle, substantially as described.

10. The combination, with a water-receptacle provided with a discharge-orifice, a vessel with which the receptacle is connected and to which the water in being supplied to the receptacle also flows, a passage-way through which the contents of the receptacle and vessel may be discharged, a valve-seat b^4 arranged in connection therewith, a tubular valve for coöperating with this valve-seat, a tubular guide in which this last-mentioned valve is fitted to slide, means by which the orifice through such tubular valve may be opened and closed, and a tubular dam adjustably secured to the tubular guide, whereby the height in which the contents of the receptacle and vessel may rise may be controlled and regulated, substantially as described.

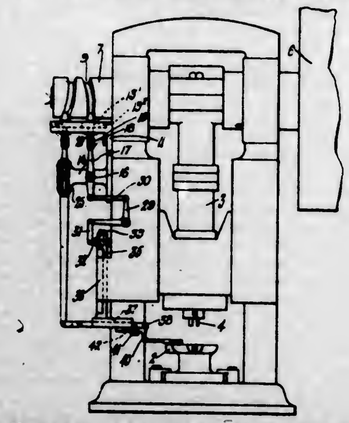
11. The combination with a water-receptacle, a vessel provided with an outwardly-extending bracket-arm upon which the receptacle is mounted, means by which this vessel may be firmly secured to the walls of a room or apartment, and a pipe b^5 between the vessel and the receptacle through which water delivered to the one will flow to the other, hot and cold water supply pipes through which hot and cold water may be supplied to the receptacle and vessel through the pipe b^5, and valve located in each inlet supply-pipe, whereby the flow of water through them to the receptacle and vessel may be controlled, substantially as described.

12. The combination, with a receptacle or bowl provided with a discharge-orifice, a vessel to which the receptacle or bowl is operatively connected, and a trap, of a chamber located beneath the bowl with a valve-seat m^3 in the under side of its upper end, a valve m for coöperating with such valve-seat, a pipe leading from the lower end of such chamber to the lower end of the vessel, a valve-seat b^4 formed in the lower end of the vessel beneath the entrance of the pipe which leads from the lower end of the chamber thereto, a tubular valve for coöperation with the valve-seat b^4 and provided in its upper end with a valve-seat o, a valve H for coöperating with this valve-seat o, and mechanism by which the valve H and the valve m in the said chamber may be moved from and toward their respective seats in unison, substantially as described.

13. The combination, with a water-receptacle or bowl, and a vessel from which it is supported and to which the water in being supplied to the receptacle and bowl also flows, a trap through which the water supplied to the receptacle or vessel may be discharged, a valve-seat b^4 located in the lower portion of the vessel, a tubular valve E for coöperating with such seat and provided with a valve-seat o at its upper end, a valve H for coöperating with the seat o, hot and cold water inlet pipes for supplying hot and cold water to the receptacle or bowl and vessel, valves arranged in such pipes for controlling the flow of the water therethrough, and means by which the valves in the inlet-pipe and the valve H in the upper end of the tubular valve may be operated, and the raising of the valve H from its seat in the upper end of the tubular valve positively insured whenever the valves in the inlet-pipes are opened, substantially as described.

14. The combination with a lavatory-fixture, of a metal frame adapted to be secured within the walls of the room or apartment, and means by which the fixture may be fixedly secured within the metal frame, substantially as described.

812,833. **FEED ATTACHMENT.** JAMES A. DORAN and JAMES C. DORAN, Providence, R. I. Filed Oct. 19, 1905. Serial No. 283,206.

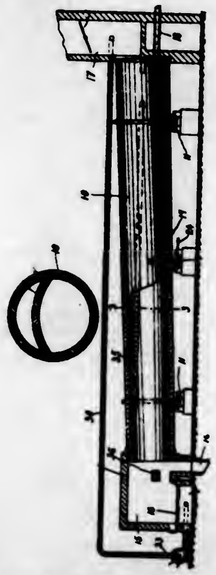


Claim.—1. In a device of the character described, the combination with a horizontally-movable slide, of a feed-finger fixed to the slide, a vertically-reciprocating guide-block in which the slide is supported, means for reciprocating the slide, and means for actuating the guide-block.

2. In combination with the frame, die, and driving-shaft of a press, of a cam upon the driving-shaft, two bars engaging the cam, a slide upon the frame, a block upon the slide, a slide in the block, a feed-finger on the second slide, pivotal connections between one cam-bar, and the second slide, and pivotal connections between the other cam-bar and the first slide.

3. In combination with the frame, die, and driving-shaft of a press, of a cam provided with two irregular channels mounted upon the driving-shaft, a bracket upon the frame, two slidable blocks in the bracket, a bar in each slide registering in each cam-channel, an arm upon the frame provided with a slot, an adjustable fulcrum-pin in the slot, a lever pivotally connected with one cam-bar and provided with a slot for receiving the fulcrum-pin, a link pivoted to the lever, a slide pivoted to the link, a feed-finger upon the slide, a second lever pivoted to the arm and pivotally connected with the second cam-bar, a bell-crank lever, a link connecting the second lever with the bell-crank lever, a second slide mounted in the frame, a link connecting the bell-crank lever with the second slide, and a block upon the second slide which supports the first slide.

812,834. **OSCILLATING CEMENT-KILN.** BYRON H. ELLERD, Brooxville, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Jan. 23, 1905. Serial No. 242,220.



Claim.—1. A cement-kiln having an inclined barrel provided with flame-producing means at its lower end, and at its higher end a stack and material-supplying means, said barrel having refractory interior walls forming a combustion-chamber of flattened internal cross-section tapering from a larger vertical diameter at the lower end to a smaller vertical diameter at the stack end, and means for automatically rocking said kiln.

2. A cement-kiln comprising a prone combustion-chamber whose interior tapers from a larger diameter at one end to a smaller diameter at the other end, flame-producing means at the larger end, an outlet at the smaller end for products of combustion, means to supply cement-forming material to the smaller end, and a double roof for said kiln, including a dead-air space.

3. A cement-kiln comprising an inclined oscillatory barrel having a refractory floor curved to a relatively short radius and a refractory roof curved to a longer radius, whereby the lateral diameter exceeds the vertical diameter, means to supply cement-forming material at the higher end, means to automatically rock said barrel, and flame-producing means at the lower end.

4. A cement-kiln comprising an inclined oscillatory barrel having a refractory floor curved to a relatively short radius and a refractory roof curved to a longer radius, whereby the lateral diameter exceeds the vertical diameter, said floor and roof approaching each other in the direction of the higher end, means for passing a stream of material through said barrel from the higher to the lower end, and means for passing a flame through said barrel in the opposite direction.

5. A cement-kiln comprising an inclined oscillatory barrel of cylindrical exterior form, and a flattened refractory wall crossing the intermediate portion of the interior of said barrel and forming the roof of the combustion-chamber.

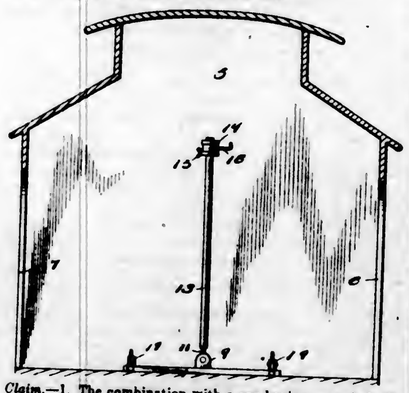
6. A cement-kiln comprising an inclined oscillatory barrel having a combustion-chamber tapering toward the higher end of the barrel, a stack at the higher end, a seat of combustion at the lower end, and means for supplying through said seat a draft-current of air and neutral products of combustion in predetermined proportion.

7. A cement-kiln comprising an inclined barrel having refractory inner walls forming a combustion-chamber of larger lateral than vertical diameter and tapering from the lower toward the higher end of the barrel, a stack and material-supplying means at the higher end, a clinker-outlet at the lower end, an exterior furnace at the lower end having grate, ash-pit below the grate and fire-chamber above opening into the barrel, a return-conduit for products of combustion connecting the stack with the ash-pit, a fan-blower in said conduit, an air-inlet to said conduit on the suction side of the fan, and means for regulating the relative quantities of air and products of combustion in the draft-current supplied to the ash-pit.

8. A cement-kiln comprising an inclined rotatory barrel, a refractory floor for feeding the material, curved on a circle concentric with the axis of rotation, a low refractory roof lying within the circle if completed, and means to automatically impart oscillatory movement to said barrel to feed the material.

9. A cement-kiln comprising an inclined barrel having combustion-chamber with refractory walls and of greater lateral width than vertical height, means to supply cement-forming material at the higher end, means to project a flame from the lower end, and means to automatically rock said barrel.

812,835. **MAIL-BAG CATCHER.** JOSIAH C. ELLIFF, Wills Point, Tex. Filed June 30, 1905. Serial No. 267,759.



Claim.—1. The combination with a car having oppositely-disposed doors, of an arm pivoted within the car for movement to extend outwardly through either of the doors, means for holding the arm yieldably within the car, means for holding the arm in its outwardly-projected position and a bag-receiving device carried by the outer end of the arm.

2. The combination with a car having oppositely-disposed doors, of an arm pivoted within the car for movement into position to project outwardly through either of the doors, means for holding the arm yieldably within the car, means for holding the arm in its outwardly-projected position and a bag-receiving hook carried by the arm, said hook extending radially of the arm and being movable to extend in different directions, said hook being also adjustable longitudinally of the arm and being movable to change the angle of its bill to the arm.

3. A mail-catcher comprising an attaching-plate, spaced ears carried by the attaching-plate, a rod engaged in the ears, a helical spring engaged with the rod and secured at one end to the plate, an arm carried by the other end of the spring, said spring being movable to hold the arm extending upwardly from the plate, a trigger carried by the plate, said arm being movable downwardly against the action of the spring for engagement with the trigger, said spring being arranged to hold the arm in frictional engagement with the trigger to hold the latter in operative position, a weight carried by the trigger and arranged to move the latter into inoperative position when said friction is removed and a bag-receiving device carried by the arm.

4. In a mail-catcher the combination with an arm movable to extend in different directions, of a collar slidably engaged with the arm and having a circumscribing peripheral groove, a band revolubly mounted in the groove, a set-screw engaged in the collar and adapted to impinge against the arm to hold the collar against movement thereupon and a bag-receiving hook swiveled in the band.

5. In a mail-bag catcher the combination with a plate, of a bag-receiving arm pivoted to the plate for movement to extend in opposite directions parallel to the plate or to extend upwardly from the plate, means for holding the arm yieldably in its upwardly-extending position and latches carried by the plate at opposite sides of the arm and arranged for engagement with the arm to hold the latter parallel with the plate.

6. In a mail-bag catcher the combination with a plate, of an arm pivoted upon the plate for movement to extend in opposite directions laterally or to extend upwardly from the plate, means for holding the arm yieldably in its upwardly-extending position and means for holding the rod in its laterally-extending positions against the action of the first-named holding means, said arm being adapted for frictional engagement of the second-named holding means to hold said holding means in operative position and being adapted for movement under pressure applied to its outer end to permit of movement of the second-named holding means into inoperative position.

812,836. **DOP.** PHILIP H. FARRELL, Flushing, N. Y. Filed Aug. 30, 1904. Serial No. 223,767.

Claim.—1. In a dop the combination of an adjustable support for a stone, a pair of jaws pinned in a slot in the dop, a hook extending from one end of each jaw, a lug extending from the opposite end of each jaw, means connected with the lugs to move the jaws and an independent removable jaw in the dop arranged to coact with the other jaws.

2. In a dop the combination of an adjustable support, a pair of jaws pinned in a slot in the dop, a hook end extending from one end of each jaw, a lug extending from the opposite end of each jaw, means connected with the lugs to move the jaws in position, an independent removable jaw having a slot, a pin in the dop supporting the latter jaw by engaging with its slot, a screw passing through one end of the latter jaw, and bearing against a wall of the dop to secure the jaw in place.

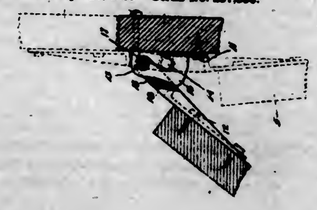
3. In a dop the combination of a threaded stem supported in the dop, a cup-shaped support on the end of the stem, a screw in the dop at right angles to said stem, a washer between the end of the screw and the said stem, the end face of the washer threaded to fit the threads of said stem a detachable jaw pinned in the dop, a hooked end extending from the jaw to clamp a stone on the support, a screw in the other end of the jaw and arranged to bear against a wall of the dop to secure the said jaw in place.

4. In a dop the combination of a stem, a cup-shaped support for a stone on the end of the stem, means to secure the stem in position, a pair of jaws pinned in a slot in the dop, a hook extending from one end of each jaw, a lug extending from the opposite end of each jaw, threaded thimbles in a cylindrical opening in the dop, the said opening connecting with the said slot, a screw having a right-handed and a left-handed thread connecting the thimbles, means to turn the screw, prongs extending from each thimble and embracing the lugs of the jaws, a stem in the dop engaging the screw to maintain it in place, an opening in the dop for a supporting-stem parallel to the stem of the support and a second opening for the supporting-stem inclined to the first opening.

812,837. **PROCESS OF WATERPROOFING TWINE.** HARRY FISHER, New York, N. Y. Filed Aug. 26, 1903. Serial No. 170,800.

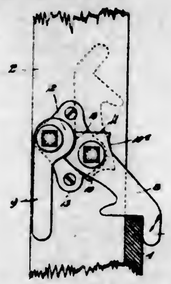
Claim.—The process of waterproofing twine consisting in treating a strip of material with casein and subsequently, after twisting the strip into a twine, treating the twisted twine with formaldehyde.

812,838. **GRAIN-DOOR FOR CARS.** JOHN FROCHT, Brainerd, Minn. Filed Apr. 27, 1905. Serial No. 257,696.



Claim.—The combination with the door-sections 4 and 5, of the hinge member 7 secured to said door-section 4 and having a bearing-shoulder 15, and an approximately vertical seat 14, having an outwardly-projecting seat 13, and the hinge member 6 secured to said sections 5 and provided with the ears 16, tie-bar 17 and bearing-shoulder 18, said shoulders 15 and 18 being held in engagement when said tie-bar 17 is engaged with said seat 13 to support the door-section 5 in an outwardly-inclined position, substantially as described.

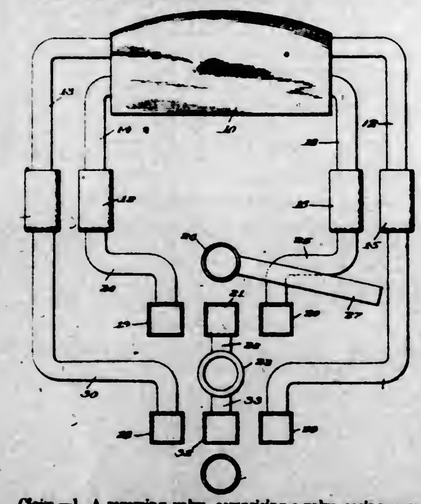
812,889. GRAIN-DOOR LOCK. JOHN PRUCHT, Brainerd, Minn. Filed Apr. 27, 1905. Serial No. 257,220.



Claim.—1. A lock of the character described comprising a pivoted dog and a lever, said dog having a stub-arm formed between concave cylindrical cam-seats, and said lever having an eccentric cam engageable with said stub-arm and fitting in said seats, to lock said dog in either of two positions, substantially as described.

2. The combination with a grain-door, of a lock therefor comprising a pivoted dog 8 and a coöperating lever 9, said dog 8 having the hooked end 8ª for action on the door, and having a stub-arm 11 formed between cylindrical cam-seats 10-10ª, and said lever 9 having an eccentric cam 12 engageable at will with said seats 10 and 10ª to lock said dog respectively in operative and in inoperative positions, and operative on said stub-arm 11 to impart pivotal door-clamping movements to said dog, substantially as described.

812,840. REVERSING-VALVE. WILLIAM A. FIELD, EUGENE B. CLARK, 2nd, and FRED WILSON, Chicago, Ill., assignors to Wellman, Seaver, Morgan Company, Cleveland, Ohio, a Corporation of Ohio. Filed June 10, 1904. Serial No. 211,968.



Claim.—1. A reversing-valve, comprising a valve-casing, a reversing-bonnet, mechanism for moving said bonnet, mechanism for raising said bonnet from one position and carrying it over and depositing it in another position, and fluid-pressure mechanism for automatically applying greater power to said bonnet during the lifting movement thereof and less power during the descending movement thereof, substantially as described.

2. A reversing-valve, comprising a valve-casing, a reversing-bonnet, mechanism for moving said bonnet, mechanism for raising said bonnet from one position and carrying it over and depositing it in another position, and means for applying greater power to said bonnet during the lifting movement thereof and less power during the descending movement thereof and for automatically increasing the speed thereof during the intermediate portion of its movement, substantially as described.

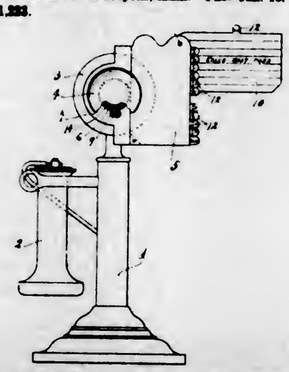
3. A reversing-valve, comprising a valve-casing, a reversing-bonnet therein, fluid-pressure mechanism for operating said bonnet, said operating mechanism having fluid-pressure-actuated means for applying greater power initially to said bonnet and afterward reducing the power applied thereto, substantially as described.

4. A reversing-valve, comprising a valve-casing, a reversing-bonnet therein, mechanism for operating said bonnet, said operating mechanism having means for applying greater power initially to said bonnet and afterward reducing the power applied thereto, and means for automatically increasing the speed of said bonnet during the intermediate portion of its movement, substantially as described.

5. A reversing-valve, comprising a valve-casing, a reversing-bonnet therein, mechanism for operating said bonnet, said operating mechanism having means for applying greater power initially to said bonnet, means for automatically increasing the speed of said bonnet during the intermediate portion of its movement, and means for reducing the speed of said bonnet toward the end of its movement, substantially as described.

6. A reversing-valve, comprising a valve-casing, a reversing-bonnet therein, guides for said bonnet having their end portions downwardly inclined and their intermediate portions substantially horizontal, mechanism for operating said bonnet, said operating mechanism having means for applying greater power to the bonnet when moving up said inclined portions of said guides and for reducing the speed thereof when descending said inclines, and means for increasing the speed of said bonnet when moving over the horizontal portions of said guides, substantially as described.

812,841. TELEPHONE MEMORANDUM ATTACHMENT. FRANK B. GILBERT, Minneapolis, Minn. Filed Jan. 16, 1906. Serial No. 241,223.

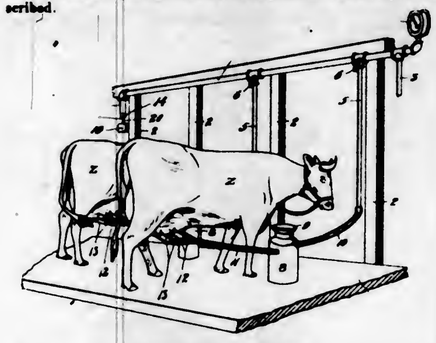


Claim.—A telephone attachment comprising a case 5, having the clamping-ring 6 and coöperating perforated web 7, the perforation 8 of said web being alined with said clamping-ring, and adapted to fit the threaded shank of a telephone-mouthpiece, and which clamping-ring is adapted to embrace said mouthpiece, a nutted bolt applied to the ends of said clamping-ring, and memorandum-cards applied within said case, substantially as described.

812,842. MILKING APPARATUS. ERRA B. GOSS, Waterloo, Iowa, assignor to The Sanitary Cow Milking Company, Minneapolis, Minn., a Corporation of Iowa. Filed June 19, 1903. Serial No. 161,574.

Claim.—1. In a milking apparatus, a device for producing pulsations comprising a weighted, normally seated valve, having an axial port and radial branch ports, which branch ports are normally closed, but which ports are in constant communication with the atmosphere, substantially as described.

2. In a milking apparatus, the combination with one of the air-pipes having a depending section 4ª, of a plug 14 in the lower end of said section 4ª, a weighted valve 15 having a tapered seat in said plug 14, said valve having the axial port 16 and flaring radial port 17, which ports 17 are normally closed and which ports 16 and 17 are in constant communication with the atmosphere, substantially as described.



812,843. SHIFTING THILL. THOMAS GRANT, Kalamazoo, Mich., assignor of one-half to The Michigan Buggy Company, Kalamazoo, Mich. Filed Mar. 13, 1905. Serial No. 249,845.

Claim.—1. The combination of a relatively stationary draft-bar having a pair of draft-rods arranged on the front thereof and parallel thereto; a shifting bar; connecting-clips for said bars, having holes therein adapted to receive the said draft-rods of said draw-bar, rigidly secured to said shifting bar, said clips being conformed to engage the forward face and under side of said draft-bar; hooks on said shifting bar; a forwardly-projecting spring on said draw-bar; a lever pivoted thereto; a loop on said lever adapted to engage said hooks on said shifting bar, said loop being pivoted to said lever at a point so related to its pivotal point as to lock the parts when the lever is in its rearward position, for the purpose specified.

2. The combination of a relatively stationary draft-bar; a shifting bar; connecting-clips for said bars; hooks on one of said shifting bars; a spring on the other bar; a lever pivoted to said spring; a loop on said lever adapted to engage said hooks, said loop being pivoted to said lever at a point so related to its pivotal point as to lock the parts when the lever is in its rearward position, for the purpose specified.

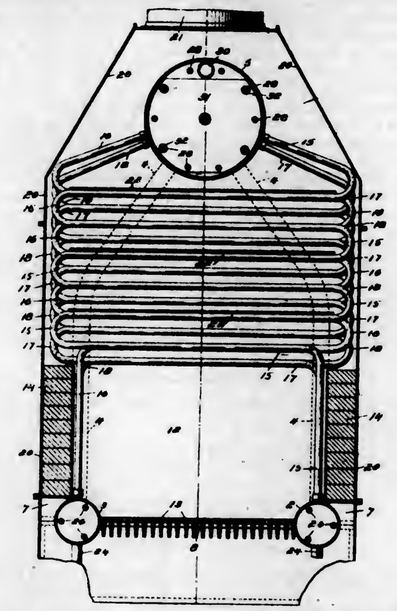
3. The combination of a relatively stationary draft-bar; a shifting-bar; connecting-clips for said bars; hooks on one of said bars; a spring carried by the other of said bars; and means for engaging said hooks carried by said spring, for the purpose specified.

4. The combination of a relatively stationary bar; a shifting bar; connecting-clips for said bars; a spring carried by one of said bars; and means for engaging the other bar carried by said spring, whereby said bars are locked together under spring tension, for the purpose specified.

5. The combination of a fixed bar; a shifting bar; forwardly-projecting clips secured to said fixed bar on which said shifting bar is mounted; a spring carried by one of said bars; and means for engaging the other bar carried by said spring, whereby said shifting bar is locked in its adjusted position under spring tension, for the purpose specified.

812,844. BOILER. SAMUEL HALLADEN, Vancouver, Canada. Filed Oct. 10, 1905. Serial No. 282,888.

Claim.—1. In a boiler of the class described; the combination with two base-pipes situated one on each side of the furnace, of a steam-drum above such base-pipes, stay-rods passing through said drum, a series of loosely-fitting partitions within said steam-drum and supported by said stay-rods, down-pipes exterior to the furnace-chamber connecting the base-pipes to the steam-drum, a series of steam-generating pipes between the base-pipes and the steam-drum such generating-pipes extending vertically upward from the base-pipe a short distance and thereafter passing back and forth across the furnace, each series of pipes from each base-pipe being connected to the same side of the steam-drum on which the base-pipe is to which they are connected, a foundation-frame in which the base-pipes rest supporting the bars of the furnace, and a casing inclosing the steam-generating pipes and that portion of the base-pipes and steam-drum to which they are connected.



2. In a boiler of the class described; the combination with two base-pipes extending along each side of the furnace and having their ends projecting beyond the furnace-casing, of a steam-drum in the middle line of the boiler above the base-pipes and similarly extending beyond the casing of the flue-space, stay-rods passing through said drum, a series of partition-plates loosely fitted on said stay-rods within said drum to extend across the drum, down-pipes from the under side of the ends of the drum exterior to the flue-casing to the similarly-projecting ends of the base-pipes, means for supporting the base-pipes and retaining them in position, a front plate provided with a furnace-doorway and a back end plate, such front and back plates being connected to the base-frame, furnace-bars suitably supported between the base-pipes, a series of steam-generating pipes inserted into the upper side of the base-pipes and extending upward a sufficient distance to clear the furnace and thereafter bent backward and forward across the furnace between it and the steam-drum each series of pipes being inserted into the steam-drum in the same side as the base-pipe is to which they are secured at the lower end, the apertures in the drum to which the steam-generating pipes are connected being pitched zigzag and the pipes to the upper line of apertures being so bent that the horizontal portion of them will in cross-section of the boiler be pitched between the horizontal portion of the pipes which are connected to the lower line of the apertures in the drum, and a casing inclosing the furnace and flue-space and extending upward to include the steam-drum.

3. In a boiler of the class described; the combination with two base-pipes and a steam-drum above them, of a series of steam-generating pipes connecting the base-pipes and drum, which generating-pipes are bent back and forth across the furnace, down-pipes exterior to the furnace and flue-spaces connecting the base-pipes to the steam-drum, a series of baffles among the cross-pipes extending alternately from the front plate to a short distance from the back plate and from the back plate to a short distance from the front plate, such baffles being placed in the open loops of the pipes of each side so that any one pipe may be removed without disturbing the other pipes or the baffles.

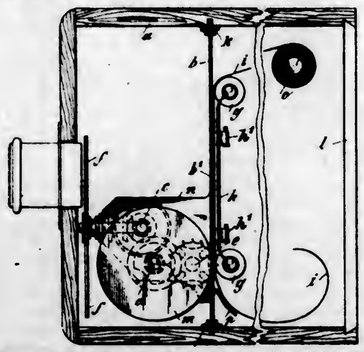
4. In a boiler of the class described; the combination with base-pipes on each side of the furnace, of a steam-drum in the middle line

above said base-pipes, a series of stay-rods running from end to end within the drum, loosely-fitting partition-plates held on said stay-rods and arranged across the steam-drum, down-pipes external to the furnace or flue-space connecting the steam-drum to the ends of the base-pipes and cross-pipes within the furnace connecting the drum with the base-pipes substantially as shown and described.

5. In a boiler of the class described; the combination with a side casing 30 forming the side wall of a furnace and having a non-conducting lining, of the end plates 9 and 10 inclosing the ends of the furnace, the casing 6 inclosing the ends of the flue-space, the smoke-stack 21, the base-pipes 2 and 3 the ends of which project beyond the end walls of the furnace-chamber, the steam-drum 5 within the upper part of the flue-space and having ends projecting beyond the ends thereof, the down-pipes 4 from the outer ends of the steam-drum to the outer ends of each base-pipe, the steam-generating pipes 15, 16, 17 and 18 from the base-pipes to the steam-drum, the baffles 22 extending alternately from the front plate to a short distance from the back plate and from the back plate to a short distance from the front plate, and the partition-plates 31 secured within the steam-drum.

6. In a boiler of the class described; the combination with base-pipes on each side of the furnace, of a steam-drum in the middle line above said base-pipes, a series of stay-rods running from end to end within the drum, loosely-fitting partition-plates held on said stay-rods and arranged across the steam-drum, down-pipes external to the furnace or flue-space connecting the steam-drum to the ends of the base-pipes, a plurality of cross-pipes connecting the steam-drum with the base-pipes, and a series of baffles among the cross-pipes.

812,845. **KINEMATOGRAPHIC CAMERA.** MAX HANSEN, Berlin, Germany. Filed Apr. 7, 1905. Serial No. 254,396.



Claim.—1. In a kinematographic camera, in combination, a camera-body, a perforated support in the body of the camera, actuating mechanism presenting feed-drums mounted entirely on the front of the support, film-guiding means and film-pressing means carried on the back thereof, and a film-band located on the rear side of the support and fed by the said drums and constantly forced against them by the said pressing means and running with unconstrained motion, as differentiated from those devices provided with positive winding means, substantially as described.

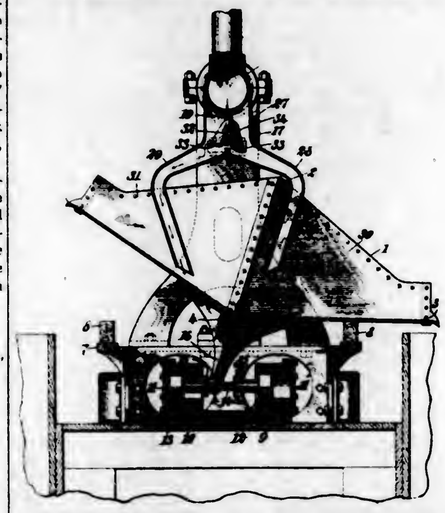
2. In a kinematographic camera, in combination, a camera-body, a removable perforated support fitting into the camera-body, actuating mechanism mounted entirely on the front side of the support, film-guiding means carried on the back thereof, and a film-band located on the rear side of the support and fed by the said actuating mechanism and running with unconstrained motion, as differentiated from those devices provided with positive winding means, substantially as described.

3. In a kinematographic camera, in combination, a camera-body, a removable perforated support fitting into the camera-body, actuating mechanism mounted entirely on the front side of the support, and film-guiding means carried on the back thereof, substantially as described.

4. In a kinematographic camera, in combination, a camera-body, a removable perforated support fitting into the camera-body and dividing it into a front and a rear chamber, actuating mechanism mounted on the front side of the support, and film-guiding means carried on the back thereof, substantially as described.

5. In combination, a camera-body having a removable back, a removable perforated support in the camera-body, actuating mechanism mounted on the front side of the support, film-guiding means carried on the back thereof, and a film-band located on the rear side of the support and fed by the said actuating mechanism and running with unconstrained motion, as differentiated from those devices provided with positive winding means, substantially as described.

812,846. **LIQUID-WEIGHING MACHINE.** CHRISTIAN J. HEDEMANN, Honolulu, Hawaii. Filed Apr. 15, 1905. Serial No. 255,794.



Claim.—1. A weighing-machine comprising a tilting or rocking tray divided into two compartments, a feed-pipe over the tray, a casing attached to the feed-pipe, tubes leading from said casing to the compartments of the tray, and a rocking deflector arranged in the casing and operated by movements of the tray.

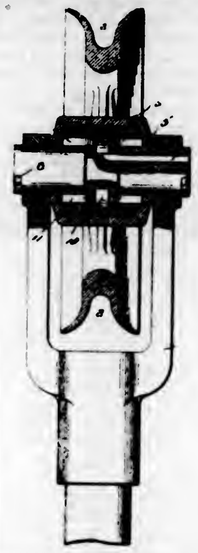
2. A weighing-machine comprising a tilting or rocking tray divided into two compartments, a feed-pipe over the tray, a casing attached to the feed-pipe, tubes leading from said casing to the compartments of the tray, a rocking deflector arranged in the casing and operated by movements of the tray, and a shifting weight supported on the tray.

3. A liquid-weighing machine comprising a tray divided into two compartments having outlets at their outer ends, trunnions on which said tray is mounted, a feed-pipe arranged above the tray, a casing attached to the feed-pipe, pipes leading from the casing to the compartments of the tray, a substantially V-shaped deflector arranged in the casing, a rock-shaft on which the deflector is mounted, an arm attached to one end of said rock-shaft, a lever having connection with said arm, a retarding-spring for the lever, rollers mounted on the lever, spring-pressed tappets carried by one of the trunnions and adapted for engagement with said rollers, and means for adjusting said tappets toward and from each other.

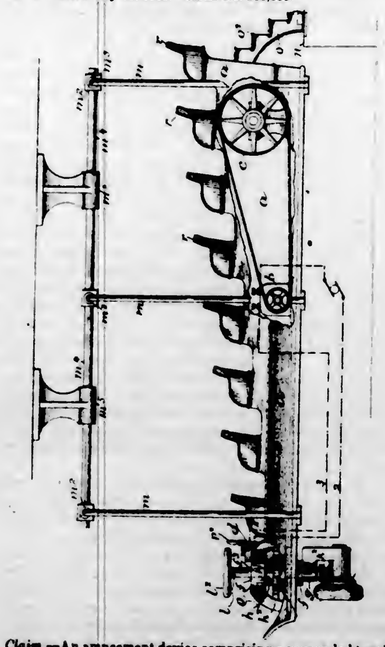
812,847. **TROLLEY-WHEEL.** JOHN HEMSLEY, Huntington, Ind. Filed Nov. 6, 1905. Serial No. 286,079.

Claim.—1. A trolley-wheel, comprising a hub having a lubricant-cavity therein and a circular opening in communication with the cavity in the hub, a shaft passing through the ends of the hub and having a circumferential groove therein in communication with the circular opening in the hub, and said shaft having a lubricant-channel passing longitudinally through the shaft from one end and having its inner end in communication with said circumferential groove in the shaft.

2. A trolley-wheel, comprising a hub having a lubricant-cavity extending around within the same, said hub having a circular opening in communication with the cavity, and said hub also having an opening extending longitudinally of the hub and in communication with the cavity and through which the lubricant is fed to the shaft, a shaft passing through the hub and having a circumferential groove therein in communication with the circular opening in the hub, and said shaft having a lubricant-channel passing longitudinally through the shaft from one end and having its inner end in communication with said circumferential groove in the shaft.

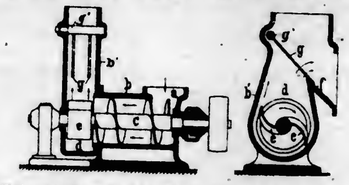


812,848. **AMUSEMENT DEVICE.** TIMOTHY C. HURST, New York, N. Y. Filed May 11, 1905. Serial No. 260,033.



Claim.—An amusement device comprising a suspended touring-car, vertically-arranged shaft journaled in a sleeve in the floor of said car, a wheel at the upper end and a beveled gear at the lower end of said shaft, a bearing on said shaft between the beveled gear and sleeve, provided with an elbow, a wheel journaled in the lower part of said elbow and provided with a beveled gear meshing with the first-mentioned beveled gear, a thrust-block surrounding said shaft above said sleeve, a threaded sleeve between said thrust-block and said first-mentioned sleeve, and a spider nut on said threaded sleeve, and an unbalanced wheel mounted within the car.

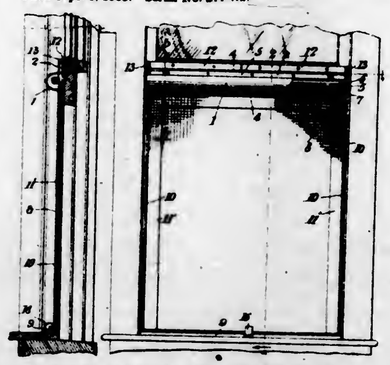
812,849. **MIXING-MACHINE.** CHARLES JAQUET, Strassburg-Königshofen, Germany. Filed Jan. 3, 1905. Serial No. 239,501.



Claim.—1. In a machine of the type set forth, a main casing horizontally disposed, a second casing vertically disposed and mounted on one end of said main casing and having its lower end projecting below the bottom of said main casing, a shaft arranged in both of said casings, a screw on said shaft extending the length of said main casing, a beater on the opposite end of said shaft, the diameter thereof being substantially the same as that of the screw.

2. In a mixing-machine, a main casing provided with an inlet, a vertical casing formed with an inclined outlet disposed transverse to said main casing, a shaft extending through both of said casings, a screw arranged on said shaft within and extending throughout said main casing, a beater arranged on said shaft and occupying the space of said vertical casing and comprising curved blades, said vertical casing extending below said main casing, the diameter of said beater being substantially the same as that of said screw, regulating-forks pivoted in the outlet end of said vertical casing, and a pivot for said forks extending parallel with said shaft.

812,850. **WINDOW-SCREEN.** DANIEL W. KEITH, Keithville, La. Filed Sept. 6, 1905. Serial No. 277,169.



Claim.—1. A screen-casing having an attaching-flange at one edge and a slot at the opposite edge, a roller supported for rotation in said casing and having spur-wheels at the ends thereof, a flexible screen upon the roller, a cleat at the free edge of the screen, and rack-bars connected with said cleat and extending through the screen-casing in engagement with the spur-wheels.

2. A screen-casing having a slot, a roller supported for rotation in said casing and provided with spur-wheels, a screen connected with the roller and extending through the slot, a cleat at the free edge of the screen, rack-bars connected with the cleat and projecting through the casing in engagement with the spur-wheels, and fenders connected with the casing beneath the rack-bars.

3. The combination with a window-sash, of a screen-casing connected therewith having a slot, a roller supported for rotation in said casing and having spur-wheels, a screen connected with the roller and extending through the slot in the casing, a cleat connected with the free edge of the screen, rack-bars connected with the cleat and projecting through the casing in engagement with the spur-wheels,

and means for detachably connecting the cleat with the window-

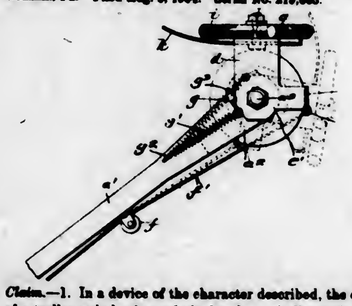
for reciprocating said bar and table toward and from a fixed

and means for detachably connecting the cleat with the window-casing.

4. The combination with a window-sash, of a screen-casing connected therewith and having a slot, a roller supported for rotation in said casing and having spur-wheels, a flexible screen connected with the roller and extending through the slot in the casing, a cleat connected with the free edge of the screen, rack-bars connected with the cleat and projecting through the casing in engagement with the spur-wheels, fender-strips connected with the cleat and extending beneath the rack-bars and between the screen-casing and the sash-rail upon which the latter is mounted, and auxiliary overlapping fender members having upturned ends engaging the fender-strips and the rack-bars.

5. The combination with a window-sash, a casing connected therewith, a screen-carrying roller in said casing, a cleat at the free edge of the screen, and spur-wheels upon the screen-carrying roller; of rack-bars connected with the cleat and projecting through the casing in engagement with the spur-wheels, and loops or guards for the reception of the free ends of the rack-bars upon the rail of the sash opposite to that with which the screen-casing is connected.

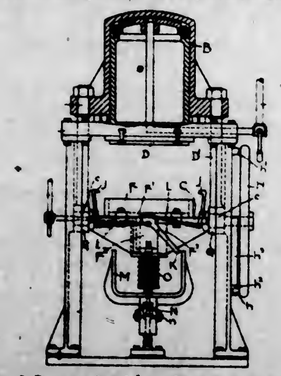
812,851. TROLLEY FOR ELECTRIC CARS. JOHN H. KIEFER, Indiana, Pa. Filed Aug. 5, 1904. Serial No. 219,063.



Claim.—1. In a device of the character described, the combination of a trolley-pole having a forked end, a spindle carried by said forked end, a trolley-wheel journaled thereon, a clip pivotally mounted upon said spindle, an upwardly-projecting extension integral with said clip, a turnstile carried by said clip, and means to hold said clip in an erect position.

2. In a device of the class described, the same comprising the usual trolley-pole having forked end, a spindle carried by said forked end, a trolley-wheel journaled thereon, a clip pivotally mounted upon said spindle, an upward extension integral with said clip, a turnstile carried by said clip, and having radially-extending curved arms, means to protect said turnstile, and means to hold said clip in an erect position.

812,852. MACHINE FOR FORMING SAND CORES. CLARENCE C. KERR, Johnstown, Pa., assignor to The Lorain Steel Company, a Corporation of Pennsylvania. Filed July 21, 1903. Serial No. 166,469.

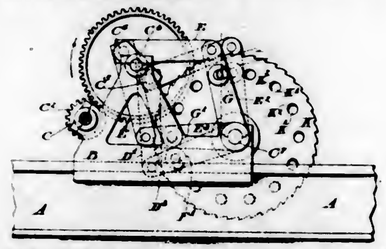


Claim.—1. In a core-forming machine, the combination of an invertible table, a core-box mounted thereon, power-operated means for reciprocating said box and table toward and from a fixed platen, a power-operated ejector carried by the said table, means for inverting said table and for retaining the core therein during inversion, and a movable core-receiving support below the said table.

2. In a core-forming machine, the combination of a fixed platen, an invertible table mounted below said platen to reciprocate toward and away from the same, a core-box mounted on said table, a power-operated ejector carried by said table, and a support for receiving the inverted ejected core.

3. In a core-forming machine, the combination with a fixed platen, of vertical guides below the same, a core-box-supporting table pivotally carried in boxes which are arranged to reciprocate in said guides, and stop devices for preventing the inversion of the table on its pivots except at a certain position.

812,853. SAW-DRIVE. WILFRED LEWIS, Philadelphia, Pa. Filed Dec. 17, 1904. Serial No. 237,231.



Claim.—1. Driving mechanism for rotary-saw blades having in combination an oscillating arm swinging on the axis of the saw, means for oscillating said arm and a clutch on said arm arranged to engage the saw-blade near but within its periphery when the arm moves in one direction and to disengage the saw-blade when the arm moves in the other direction.

2. Driving mechanism for rotary-saw blades having in combination a plurality of oscillating arms swinging on the axis of the saw, means for oscillating said arms, as described and so that they move in the same direction at different times, and a clutch on each said arm arranged to engage the saw-blade near but within its periphery when the arm moves in one direction and to disengage the saw-blade when the arm moves in the other direction.

3. Driving mechanism for rotary-saw blades having in combination an oscillating arm swinging on the axis of the saw, means for oscillating said arm, and a clutch on said arm arranged to engage the saw-blade without lateral thrust and near but within its periphery when the arm moves in one direction and to disengage the saw-blade when the arm moves in the other direction.

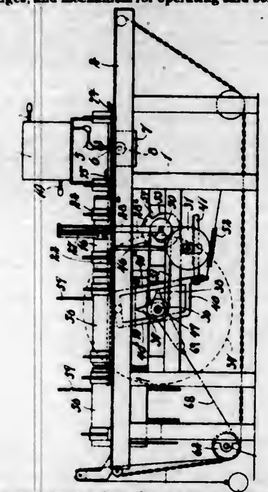
4. Driving mechanism for rotary-saw blades having in combination a saw-blade having near its periphery an annular series of transverse perforations, an oscillating arm swinging on the axis of the saw-blades, means for oscillating said arm and a spring-latch H, carried by the arm in position to register with and engage the perforations in the saw-blade as described.

5. Driving mechanism for rotary-saw blades having in combination a saw-blade having near its periphery an annular series of transverse perforations, a plurality of oscillating arms swinging on the axis of the saw-blade, one or more of said arms being situated on one side of the saw and one or more on the other side, means for oscillating said arms and a spring-latch H, carried by each arm in position to register with and engage the perforations in the saw-blade as described.

6. Driving mechanism for rotary-saw blades having in combination two oscillating arms pivoted on the axis of the saw-blade on each side thereof, a driving-shaft having two oppositely-extending cranks, two connecting-rods extending in different directions from each crank and connecting with the oscillating arms as described so as to move the two arms on the same side of the blade at different times in the same direction, and a clutch on each swinging arm arranged to engage and drive the saw-blade when moved in one direction and to disengage the blade when moved in the opposite direction.

812,854. VENEER-BENDING MACHINE. HERBERT O. LITTLE, Ingersoll, Canada, assignor to The Ontario Fruit Package Company, (Limited,) Ingersoll, Canada, a Corporation of Canada. Filed June 21, 1905. Serial No. 266,271.

Claim.—1. A machine for bending sheets of veneer comprising a form having edges about which the blanks are to be bent, moistening devices in line with said edges and arranged to engage opposite sides of a blank being fed to the form and moisten the same only on the lines of bend, bending-leaves supported to move in curved paths about the edges, and mechanism for operating said bending-leaves.



2. A machine for bending sheets of veneer comprising a form having edges about which the blanks are to be bent, a table in front of said form arranged to hold a sheet in position to be fed to the form, moistening devices set into the table approximately flush with the supporting-surface thereof and in line with the edges of the form for engaging and moistening the under side of the sheet on the lines of bend as the sheet is fed to the form, moistening devices above the table for wetting the upper side of the sheet on the same lines, bending-leaves supported to move in curved paths about the edges, and mechanism for operating said bending-leaves.

3. A bending-machine comprising a moistening device, a form, a bender arranged to carry a portion of a sheet of stock about the form, a clamp movable toward and from the side of the form, mechanism for moving the clamp toward the form after the bending operation to engage the bent portion of the stock and hold the same beside the form, and drying means adjacent the form constructed to closely confine and hold the stock in the shape given it by the form and to dry the stock while so holding it.

4. A bending-machine comprising a moistening device, a bending-form, a bender arranged to carry a portion of a sheet of stock about the form, a clamp adjacent the form, mechanism for moving said clamp toward the form to engage the bent portion of the stock and hold the same beside the form, a drying-form in line with the bending-form of a shape similar thereto with means for confining and holding the stock in the shape given it by the bending-form, and provisions for heating said drying-form.

5. A veneer-bending machine comprising a fixed form, having a flat surface and an edge, a bending member movable in a curved path about said edge, mechanism for oscillating said bending member in such path to engage and carry a portion of a sheet of veneer about said edge and then release the sheet, a clamp movable toward and from the form, and mechanism for moving said clamp toward the form to hold the bent portion beside the form as the same is released by the bending member.

6. A bending-machine comprising a form having edges, bending members supported and guided to move substantially concentrically about such edges, and means for simultaneously oscillating said bending members in opposite directions comprising an endless flexible driving element arranged with two stretches moving oppositely, each stretch being connected with one of the benders and means for moving said driving element first in one, and then in the opposite direction.

7. In a machine of the character described having bending members, means for operating said members, comprising an oscillatory shaft bearing wheels, and an endless flexible driving element passing over said wheels and guided in parallel stretches in the directions of movement of said members, one stretch being crossed over the other, whereby rotation of the shaft causes the stretches of said element to be moved oppositely, and each stretch being connected to one of the bending members.

8. In a machine of the character described having bending members, means for operating said members, comprising a main driving-shaft movable in one direction, an oscillatory shaft, reciprocatory driving connections between said main and oscillatory shafts for moving the latter first in one and then in the opposite direction, and an endless flexible driving element passing over said wheels and guided in parallel stretches in the directions of movement of said members, one stretch being crossed over the other, whereby rotation of the shaft causes the stretches of said element to be moved oppositely, and each stretch being connected to one of the bending members.

9. In a machine of the character described, a pair of bending members, an endless flexible cord or belt doubled to form two parallel lengths forming loops at their ends passing across the machine, one length being connected to each bending member, a shaft approximately in the same plane with the cord, and pulleys carried by said shaft, one of the loops formed in the cord being opened and passed over one of said pulleys, and the other being crossed and passed over the other pulley, whereby movement of both pulleys in one direction drives the lengths of said cord, and thereby the bending members in opposite directions.

10. A bending-machine comprising bending instrumentalities, a continuous intermittently-movable element constructed to feed stock to said instrumentalities, a shaft engaged with said element for moving the same, a ratchet-wheel fast on said shaft, a drum loose on the shaft, a pawl carried by the drum adapted to engage the ratchet when moved in one direction, a continuously-moving main shaft having a crank, a line connected to the crank passing about the drum, and yielding means for holding said line under tension, and connections from the main shaft arranged to operate said bending instrumentalities.

11. A bending-machine comprising a form, means for bending a blank about the same, a clamp pivoted adjacent a side of the form and movable toward and away from the same, a cam arranged to act on the clamp and move the same into contact with a portion of the blank after it has been bent, and automatic mechanism for operating said cam.

12. A bending-machine comprising a bending-form, having an edge for shaping a blank to be bent, a moistening device in line with said edge, means adjacent the bending-form for bending the blank about the edge of the form, a heated drying-form in line with the bending-form constructed to hold the blank in the shape given it by the bending means, and a continuous element extending by the moistening device and the bending and drying forms for feeding the blank past the moistening device, whereby the blank is moistened on the line of bending, to the bending means and form, and thence to the drying-form.

13. In a machine of the character specified, a drive-shaft, cam members thereon arranged in different planes, a pivoted frame having sides in different planes, each side being arranged to be operated by one only of the cam members, veneer-bending mechanism and connections from said frame for operating said mechanism.

14. A machine for bending veneer comprising a form having edges, guide-plates fixed adjacent the ends of the form and having grooves curved concentrically about said edges, bending members, plates connected to the ends and projecting beyond the sides of said members having ribs extending into said grooves and supporting the bending members, means for moving said members whereby they are carried about the edges of the form and caused to bear upon and bend about such edges the projecting ends of a sheet of veneer laid on the form, and flexible sheets connected at their edges to the bending members and a fixed abutment adjacent the form, one of such connections being yielding.

15. A machine for bending veneer comprising a form having a supporting-surface and sides angularly disposed thereto, divided therefrom by abrupt edges, fixed supports adjacent the supporting-surface of the form, guide-plates connected to the supports and having cam-grooves concentric with the edges of the form, benders having projections extending into said grooves and wholly supported thereby, means for moving the benders, whereby they are caused by said grooves to travel around the edges of the form and to carry thereabout the projecting ends of a sheet of veneer laid on the supporting-surface of the form, flexible sheets secured to the supports and carried around portions of the benders, and a plurality of springs connected to the outer edge of each sheet and fixed to the benders.

16. A machine for bending veneer, comprising a form having flat surfaces and dividing edges intermediate the surfaces, bending members movable concentrically about said edges and arranged to engage portions of a blank of veneer and fold the same about the form, holders for engaging and retaining the ends of the blank adjacent the sides of the form while the benders are returned, and automatic mechanism for first operating the benders and then moving the holders toward the sides of the form.

17. A machine for bending veneer, comprising a form having flat surfaces and dividing edges intermediate the surfaces, bending members movable concentrically about said edges and arranged to engage portions of a blank of veneer and fold the same about the form, holders for engaging and retaining the ends of the blank adjacent the sides of the form while the benders are returned, a second form shaped similarly to the first and in alinement therewith, reversely-shaped holders adjacent the second form and separated therefrom by a space of a width and shape substantially identical with that of a bent blank, and provisions for heating said second form and holders.

18. A machine for bending veneer comprising a form having an upper flat supporting-surface, substantially perpendicular sides and dividing edges, supports above the form having under surfaces parallel with the upper surface of the form and extending to the edges thereof, benders normally held by said supports adjacent the outer sides thereof, being greater in an up-and-down direction than laterally and formed with narrow under surfaces extending outward in the same plane with the under surfaces of the supports and with upwardly-extending outer surfaces, flexible metal sheets each secured at one edge to one of said supports and wrapped about the lower and outer sides of one of the benders, springs yieldingly connecting the outer edges of the sheets to the benders, and mechanism for oscillating the benders about the edges of the form to carry the under surfaces of the benders into parallelism with the sides of the form and back to normal position.

19. A machine for bending veneer comprising a form having an upper flat supporting-surface, substantially perpendicular sides and dividing edges, supports above the form having under surfaces parallel with the upper surface of the form and extending to the edges thereof, guide-plates fixed to said supports having grooves curved concentrically with said edges, bending members normally located beside the supports, elongated curved ribs fitting in said grooves and rigedly connected to the ends of said members, constituting the sole supporting means for the benders and causing the same when moved to travel in paths corresponding to said grooves, and means for oscillating said bending members.

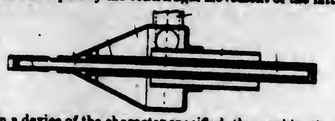
20. In a veneer-bending machine, a shaping-form having edges to shape the bends in a sheet of veneer, bending members movable about said edges to carry portions of a sheet of veneer thereabout, holders movable toward and from the sides of the form to engage and hold the ends of the bent sheet, a second form in line with the shaping-form, an endless feeding element extending longitudinally of the machine, a main drive-shaft and connections therefrom for operating the bending members, the holders and the feeding element, arranged to first carry the bending members about the form, then advance the holders toward the form, retract the bending means, and actuate the feeding element to carry the bent sheet from the shaping-form to the second form and to feed a fresh blank to the shaping-form.

21. In a veneer-bending machine, a shaping-form having edges to shape the bends in a sheet of veneer, bending members movable about said edges to carry portions of a sheet of veneer thereabout, holders movable toward and from the sides of the form to engage and hold the ends of the bent sheet, a second form in line with the shaping-form, an endless feeding element extending longitudinally of the machine, a flexible driving element having oppositely-moving portions connected to the respective bending members, a main drive-shaft, cam members rotated by the shaft for moving said driving element back and forth, cams operated by the driving-shaft for moving the holders toward and from the shaping-form, and intermittent mechanism operated by the driving-shaft for moving said feeding element.

812,855. MILKING-MACHINE. FREDRIK LJUNGSTRÖM, Stockholm, Sweden, assignor to Aktiebolaget Separator, Stockholm, Sweden. Filed Nov. 11, 1905. Serial No. 286,807.

Claim.—1. In a device of the character specified, the combination with a feed-tube and a delivery-tube, of a vessel interposed between said tubes and adapted to impart a centrifugal movement to liquid supplied thereto, and means to vent from the vessel air separated from the liquid therein by the centrifugal movement thereof.

2. In a device of the character specified, the combination with a feed-tube and a delivery-tube, of a vessel interposed between said tubes adapted to impart a centrifugal movement to liquid supplied thereto, and a conduit in said vessel to convey therefrom the air separated from the liquid by the centrifugal movement of the latter.



3. In a device of the character specified, the combination with a feed-tube and a delivery-tube, of a vessel interposed between said tubes and adapted to impart a centrifugal movement to liquid supplied thereto, an air-chamber in the vessel above said tubes, and a conduit to establish communication between the chamber and atmosphere.

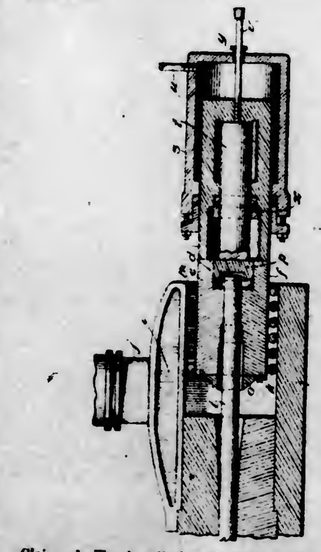
4. In a device of the character specified, the combination with a feed-tube and a delivery-tube, of a vessel interposed between the tubes and adapted to impart a centrifugal movement to liquid supplied thereto, a tube in the vessel to convey air from the latter, and a valve on said tube operable by the air therein.

5. In a device of the character specified, the combination with a feed-tube and a delivery-tube, of a vessel interposed between the tubes and adapted to impart a centrifugal movement to liquid supplied thereto, an air-chamber in the vessel, an air-conduit leading from near the top of the chamber down into the vessel and communicating with the atmosphere, and a valve on the conduit operable by the air therein.

6. A device of the character specified comprising a vessel having an air-chamber in its top, a tube opening tangentially into the vessel, a tube axially mounted in the latter, a conduit within the latter tube extending through the top of the vessel and a conduit closed at one end opening into the air-chamber and surrounding the aforesaid conduit.

7. A device of the character specified comprising a cylindrical vessel having a conical chamber mounted thereon, a tube opening tangentially into the vessel, a tube axially mounted in the latter, a tube mounted concentrically within the latter tube extending out through the conical chamber, a valve on the outer end of said tube, a tube inclosing the latter tube closed at its bottom and extending to near the top of the conical chamber, for the purpose set forth.

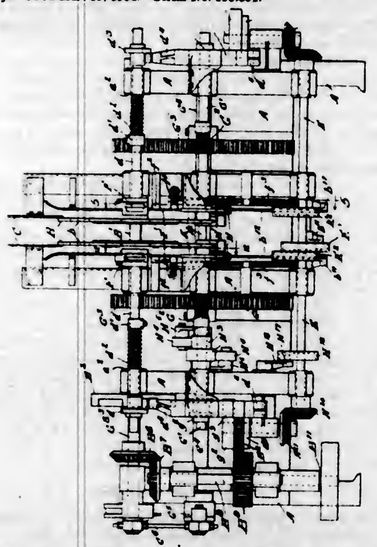
812,856. METHOD OF UPSETTING METAL. HENRIK V. LOSS, Philadelphia, Pa. Filed Dec. 6, 1903. Renewed Jan. 10, 1906. Serial No. 295,461.



Claim.—1. The described method of upsetting a bar or billet which consists in first inclosing the bar or billet in dies longitudinally separable, causing said dies to approach one another and simultaneously applying end pressure to the bar to cause the metal to move with the dies thus swelling the metal within and between them, continuing the approachment of and completing the upsetting of the metal within and between the dies, and finally upsetting the end of the bar while held within the said dies.

2. The described method for upsetting a bar or billet, which consists in first inclosing the bar or billet in dies longitudinally separable; secondly, moving said dies toward one another and causing the metal to move with said dies in order to upset the metal within and between them, and finally upsetting the end of the bar while held within said dies.

812,857. AUTOMATIC SQUARE-CAN HEADING AND CRIMPING MACHINE. AUGUSTUS LOSS, San Francisco, Cal., assignor to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Mar. 19, 1904. Serial No. 198,891.



Claim.—1. In a square-can heading and crimping machine, the combination with an intermittently-rotating can-body carrier or feed wheel furnished with pockets to receive the can-bodies, and with opening and closing spring-actuated can-body clamps, of a can-body feed device or chute, can-head chutes, oscillating can-head feed-escapements for the can-head chutes, can-head guides at the base of the can-head chutes, reciprocating can-heading plungers for pushing the can-heads onto the can-bodies, reciprocating and rotating crimper-chucks, crimping-rolls mounted on oscillating arms, pattern-cams on the crimping-chuck shafts, oscillating arms having rollers engaging the pattern-cams, mechanism connecting the crimping-roller arms with the pattern-cam-roller arms, and an operating-cam for the crimping-rollers, substantially as specified.

2. In a square-can heading and crimping machine, the combination with an intermittently-rotating can-body feed-wheel having pockets to receive the can-bodies and opening and closing can-body clamps, can-head feed-chutes, can-head feed devices, reciprocating can-heading plungers, reciprocating and rotating crimping-chucks, crimping-rollers, and mechanism for operating the crimping-rollers, means for automatically and positively opening the can-body clamps substantially as specified.

3. In a square-can heading and crimping machine, the combination with an intermittently-rotating can-body feed-wheel having pockets to receive the can-bodies, opening and closing can-body clamps, can-head chutes, can-head feeders, reciprocating heading-plungers, reciprocating and rotating crimping-chucks, pattern-cams, crimping-rollers, connecting mechanism between the crimping-rollers and pattern-cams, and a pressure-cam for operating the crimping-rollers, substantially as specified.

4. The combination with can-head chutes and heading-plungers, of an intermittently-revolving can-body feed-wheel, having pockets to receive the can-bodies, and opening and closing can-body clamps, and springs for yieldingly closing the clamps, means for automatically and positively opening the can-body clamps substantially as specified.

5. The combination with can-head chutes and heading-plungers, of an intermittently-revolving can-body feed-wheel, having pockets to receive the can-bodies, and opening and closing can-body clamps, and springs for yieldingly closing the clamps, and a stationary cam for positively holding the clamps closed in the heading position, substantially as specified.

6. The combination with can-head chutes and heading-plungers, of an intermittently-revolving can-body feed-wheel having pockets to receive the can-bodies, and opening and closing can-body clamps, a spring for yieldingly closing the clamps, a stationary cam for positively holding the clamps closed in the heading position, and a movable device for positively opening the clamps, substantially as specified.

7. The combination with can-head chutes and heading-plungers, of an intermittently-revolving can-body feed-wheel having pockets to receive the can-bodies, and opening and closing can-body clamps, a spring for yieldingly closing the clamps, a stationary cam for positively holding the clamps closed in the heading position, reciprocating and rotating crimping-chucks, crimping-rollers and a movable lever for positively opening the can-body clamps at the crimping position, substantially as specified.

8. The combination with can-head chutes and heading-plungers, of an intermittently-revolving can-body feed-wheel having pockets to receive the can-bodies, and opening and closing can-body clamps, a spring for yieldingly closing the clamps, a stationary cam for positively holding the clamps closed in the heading position, reciprocating and rotating crimping-chucks, crimping-rollers and a movable lever for positively opening the can-body clamps at the crimping position, and a stationary cam for positively opening the can-body clamps at the discharge position, substantially as specified.

9. In a square-can heading and crimping machine, the combination with can-head chutes, of reciprocating heading-plungers, an intermittently-revolving can-body feed-wheel having pockets therein to receive the can-bodies, and automatically opening and closing can-body clamps, reciprocating and rotating crimping-shafts and crimping-rollers, and means for positively opening the can-body clamps at the crimping position substantially as specified.

10. In a square-can heading and crimping machine, the combination with can-head chutes, of reciprocating heading-plungers, an intermittently-revolving can-body feed-wheel having pockets therein to receive the can-bodies, and opening and closing can-body clamps, reciprocating and rotating crimping-shafts, pattern-cams and crimping-rollers, connecting mechanism between the pattern-cams and the crimping-rollers, and means for operating the crimping-rollers, substantially as specified.

11. In a square-can heading and crimping machine, a can-body feed-wheel having pockets therein to receive the can-bodies, opening and closing can-body clamps, and springs for closing said clamps, and a movable positively-operated device for opening the clamps at the crimping position substantially as specified.

12. In a square-can heading and crimping machine, a can-body feed-wheel having pockets therein to receive the can-bodies and opening and closing can-body clamps, springs for closing said clamps, in combination with a positively-operated device for automatically opening said clamps at the crimping position, substantially as specified.

13. In a square-can heading and crimping machine, a can-body feed-wheel having pockets therein to receive the can-bodies and automatically opening and closing can-body clamps, springs for closing said clamps, in combination with a stationary cam for positively closing and holding closed the clamps at the heading position, and means for automatically opening the clamps at the crimping position, substantially as specified.

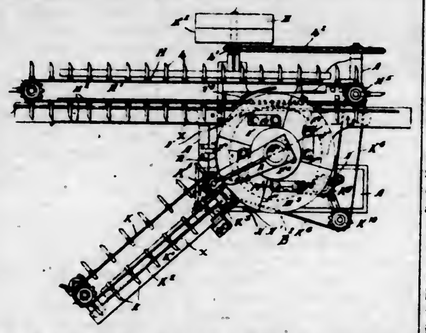
14. In a square-can heading and crimping machine, a can-body feed-wheel having pockets therein to receive the can-bodies, and opening and closing can-body clamps, springs for closing said clamps, in combination with a stationary cam for positively closing and holding closed the clamps, and a movable positively-operated device for opening the clamps, substantially as specified.

812,858. AUTOMATIC ROUND-CAN HEADING AND CRIMPING MACHINE. AUGUSTUS LOSS, San Francisco, Cal., assignor to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Mar. 19, 1904. Serial No. 198,893.

Claim.—1. In a machine for crimping and heading filled cans, the combination with a turret or carrier for the cans, of a plurality of lower or heading plungers, a plurality of upper or crimping plungers, a plurality of can-receiving pockets, of a plurality of pairs of plungers, a plurality of sets of opening and closing jaws having crimping-faces, a

3. In a machine for embossing card-mounts, a cylindrical rotatable die and a cylindrical rotatable matrix, combined with feed and means for effecting a simultaneous but differential adjustment

Claim.—1. In a machine for crimping and heading filled cans, the combination with a turret or carrier for the cans, of a plurality of lower or heading plungers, a plurality of upper or crimping plungers, a plurality of sets of segmental opening and closing heading-jaws, furnished with bevel-faces for guiding the can-bodies into the can-heads, and with bevel-shoulders for crimping the flanges of the heads on the headed cans, means for feeding or delivering the can-bodies onto the carrier, and means for feeding or delivering the can heads or covers into the heading-jaws, means for discharging a cover when no can-body is present in the carrier to receive it, and means for continuously driving the can-carrier shaft at a lower speed while receiving the can-bodies, and at a high speed at other times, substantially as specified.



2. In a can heading and crimping machine, the combination with a pair of opposing or upper and lower movable plungers, of opening and closing segmental combined heading and crimping jaws, the upper plunger first seating the can-head in said jaws, the lower plunger then forcing the can-body through the heading-jaws into the can-head, and the upper plunger then forcing the headed can against the crimping-shoulder of said jaws and crimping the can and discharging it from said jaws, substantially as specified.

3. The combination with a pair of opposing or upper and lower movable plungers, of opening and closing jaws having bevel-faces for guiding the end of the can-body into the cover, and bevel-shoulders for crimping the cover on the can after it is headed, the upper plunger first seating the can-head in said jaws, the lower plunger then forcing the can-body through the heading-jaws into the can-head, and the upper plunger then forcing the headed can against the crimping-shoulder of said jaws and crimping the can and discharging it from said jaws, substantially as specified.

4. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of opposing or upper and lower movable plungers, and a plurality of sets of opening and closing jaws having inclined or flaring can-heading faces and inclined or flaring crimping-faces, the upper plunger of each pair first seating the can-head in the heading and crimping jaws, the lower plunger of each pair then forcing the can-body through the crimping-jaws into the can-head, and the upper plunger of each pair then forcing the headed can past the crimping-shoulder of the heading-jaws and out of said jaws, substantially as specified.

5. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of opposing or upper and lower movable plungers, a plurality of sets of opening and closing jaws having inclined heading-faces and inclined crimping-faces, and a can-body feeder, the upper plunger of each pair first seating the can-head in the heading and crimping jaws, the lower plunger of each pair then forcing the can-body through the crimping-jaws into the can-head, and the upper plunger of each pair then forcing the headed can past the crimping-shoulder of the heading-jaws and out of said jaws, substantially as specified.

6. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of opposing or upper and lower movable plungers, a plurality of sets of opening and closing jaws having crimping-faces, a can-body feeder, and a can head or cover feeder, the upper plunger of each pair first seating the can-head in the heading and crimping jaws, the lower plunger of each pair then forcing the can-body through the crimping-jaws into the can-head, and the upper plunger of each pair then forcing the headed can past the crimping-shoulder of the heading-jaws and out of said jaws, substantially as specified.

7. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of plungers, a plurality of sets of opening and closing jaws having crimping-faces, a can-body feeder, and a can head or cover feeder, said can-head feeder having a can head or cover discharge trap, substantially as specified.

8. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of plungers, a plurality of sets of opening and closing jaws having crimping-faces, a can-body feeder, a can head or cover feeder, said can-head feeder having a can head or cover discharge trap, said can-body carrier having a device actuated by the presence or absence of the can therein to control the operation of said can-head trap, substantially as specified.

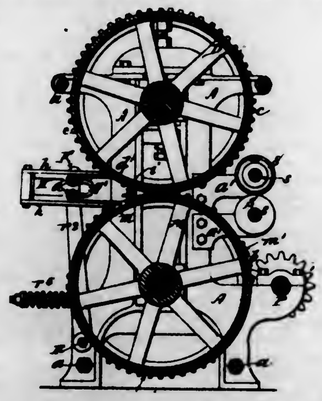
9. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of plungers, a plurality of sets of opening and closing jaws having crimping-faces, a can-body feeder, a can head or cover feeder, and mechanism for continuously rotating said can-body carrier at different speeds during the can-receiving and can heading and crimping operations, substantially as specified.

10. The combination with a can-body carrier having a plurality of can-receiving pockets, of a plurality of pairs of plungers, a plurality of sets of opening and closing jaws having heading-faces and crimping-faces, a can-body feeder, a can head or cover feeder, mechanism for rotating said can-body carrier, and means for retarding the movement of said carrier while passing the can-body feeder substantially as specified.

11. In a can-heading machine, the combination with a can carrier or turret, opening and closing heading-jaws carried thereby, heading-plungers, a can-body feeder, a can-head runway furnished with a trap for discharging a can head or cover in case no can-body is present on the carrier to receive it, and means for opening said trap to discharge a cover when no can-body is present, substantially as specified.

12. In a can-heading machine, the combination with a can carrier or turret, opening and closing heading-jaws carried thereby, heading-plungers, a can-body feeder, a can-head runway furnished with a trap for discharging a can head or cover in case no can-body is present on the carrier to receive it, and means for opening said trap to discharge a cover when no can-body is present, said means comprising a movable device N on the carrier, a can-body-operated lever N^2 on the carrier for actuating said device, and a trigger R projecting in the path of said movable device N on the carrier and connected with said trap, substantially as specified.

812,859. **EMBOSSING-MACHINE.** JAMES F. LOWENHAUPT, Woodhaven, N. Y. Filed May 26, 1905. Serial No. 262,133.



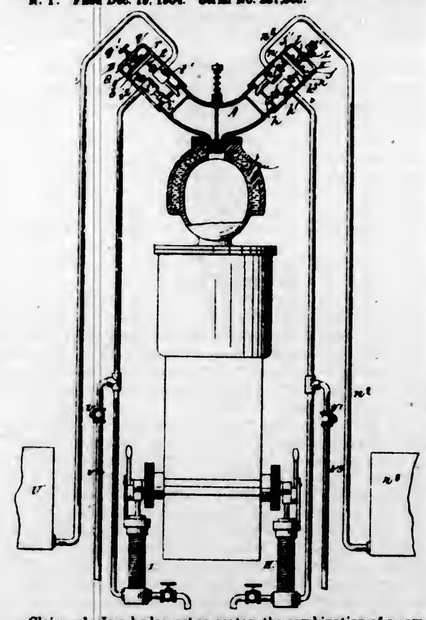
Claim.—1. In a machine for embossing, in combination with a cylindrical rotatable die and a cylindrical rotatable matrix, the cam E, rock-shaft R, levers r^2, cross-head F, rock-shafts G, grippers g', and slides H, for the purpose set forth.

2. In a machine for embossing, in combination with a cylindrical rotatable die and a cylindrical rotatable matrix, the cam E, springs r^3, rock-shaft R, levers r^2, cross-head F, rock-shafts G, grippers g', and slides H, for the purpose set forth.

3. In a machine for embossing card-mounts, a cylindrical rotatable die and a cylindrical rotatable matrix, combined with feed mechanism adapted to forward the cardboard, means coöperative with a portion of said feed mechanism for returning the grippers thereof to their normal position, a registering shoulder, and means, operable prior to the forward movement of the grippers, for tripping said shoulder to permit of the feeding of the edge of the card to the dies.

4. In a machine for embossing card-mounts, a cylindrical rotatable die and a cylindrical rotatable matrix, combined with feed mechanism adapted to forward the cardboard, means coöperative with a portion of said feed mechanism for returning the grippers thereof to their normal position, a registering shoulder, means, operable prior to the forward movement of the grippers, for tripping said shoulder to permit of the feeding of the edge of the card to the dies, a rock-shaft carrying said shoulder and having a projection, and a roller carried by the die for coöperation with said projection.

812,860. **HYDROCARBON-MOTOR.** ABBOT A. LOW, Horseshoe, N. Y. Filed Dec. 19, 1904. Serial No. 237,268.



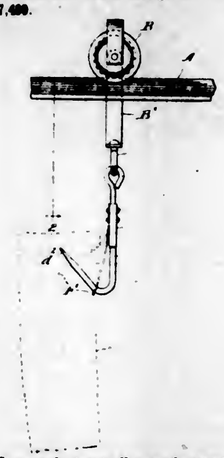
Claim.—1. In a hydrocarbon-motor, the combination of a combustion-chamber, a mixing-chamber, an inlet-valve interposed between said combustion-chamber and mixing-chamber, an intersticed screen in said mixing-chamber, means for injecting a jet of hydrocarbon fuel against said screen, means for injecting a jet of compressed air against said screen, and means for effecting a simultaneous but differential adjustment of the quantity of fuel and compressed air injected against said screen in the mixing-chamber, for the purpose described.

2. In a hydrocarbon-motor, the combination of a combustion-chamber, a mixing-chamber, an inlet-valve interposed between said combustion-chamber and mixing-chamber, an intersticed screen in said mixing-chamber, means for injecting a jet of hydrocarbon fuel against said screen, means for injecting a jet of compressed air against said screen, and means for simultaneously increasing or diminishing the quantity of fuel and compressed air injected against said screen in the mixing-chamber, for the purpose described.

3. In a hydrocarbon-motor, the combination of a combustion-chamber, a mixing-chamber, an inlet-valve interposed between said combustion-chamber and mixing-chamber, an intersticed screen in said mixing-chamber, means for injecting a jet of compressed air against said screen, the injectors being arranged convergently with relation to each other so that the jets of hydrocarbon and compressed air impinge against each other at or near the center of said screen, and means for effecting a simultaneous but differential adjustment of the quantity of fuel and compressed air injected against said screen in the mixing-chamber, for the purpose described.

4. In a hydrocarbon-motor, the combination with a mixing-chamber communicating with the combustion-chamber, of means for simultaneously supplying alcohol, and hydrocarbon to said mixing-chamber, and means for varying and adjusting the supply of compressed air thereto in a differential but prescribed proportion, for the purpose set forth.

812,861. **PENDENT OR TROLLEY-CARRIER MEAT-HOOK.** GEORGE W. MARTIN, Chicago, Ill., assignor of two-thirds to James S. Agar and David C. Roach, both of Chicago, Ill. Filed June 20, 1905. Serial No. 265,499.



Claim.—1. In a pendent or trolley-carrier meat-hook, the combination with the trolley, of a meat-hook having a pivotal and swivel connection with the pendent arm of the trolley, and having its shank furnished with a spring-supporting block, and a hook-freeing flat curved spring secured at its upper end to the spring-supporting block on the hook-shank and extending across the mouth of the hook, and having a slot in its free end to receive the hook-prong and permit flexure of the spring, substantially as specified.

2. A pendent meat-hook having a hook-freeing spring secured to the shank portion of the hook, and projecting across the mouth of the hook to withdraw or free the hook-prong from the article suspended therefrom when it is lifted, substantially as specified.

3. A pendent meat-hook furnished with a spring to free or withdraw the same from the article suspended on the hook when it is lifted, substantially as specified.

4. A pendent meat-hook having a hook-freeing spring secured to the shank portion of the hook, and projecting across the mouth of the hook to withdraw or free the hook-prong from the article suspended therefrom when it is lifted, said hook-freeing spring having a slot at its free end to receive and accommodate the prong of the hook, substantially as specified.

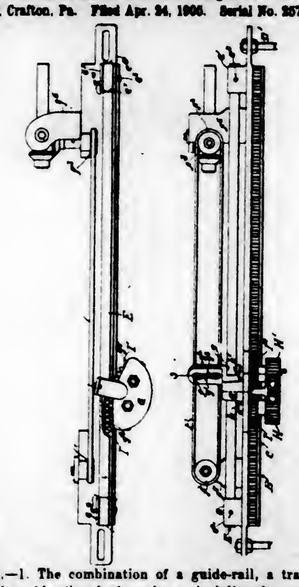
812,862. **BUCKLE.** ALVIN S. MERRILL and HENRY M. HOWARD, Beulah, Mich. Filed Sept. 6, 1905. Serial No. 277,196.

Claim.—1. A buckle comprising oppositely-disposed bowed members having overlapping ends, a cross-bar integral with one of the members and extending therefrom at a point equidistant from the ends of said member, one of the ends of the cross-bar projecting into the other member at a point equidistant from the ends of said member, and constituting a pivot therefor, and a line-engaging lug extending from said bar.

2. A buckle comprising oppositely-disposed bowed members.

one of said members having its ends beveled on both sides, and the other member having each end beveled on one side, the ends of the two members being adapted to overlap, a cross-bar integral with one of the members and extending therefrom at a point equidistant from its ends, one end of said cross-bar projecting into the other member at a point equidistant from the ends thereof, and constituting a pivot for said member, and a line-engaging lug extending from the center of said bar

812,863. **FEEDING MECHANISM FOR CARDING-MACHINES.** PATRICK L. MCBRIDE, Lowell, Mass., assignor to Thomas Kennedy Miller, Crafton, Pa. Filed Apr. 24, 1905. Serial No. 257,045.



Claim.—1. The combination of a guide-rail, a traveler-body supported by said rail and adapted to swivel directly on said rail, a traveling belt or chain arranged at the rear of said guide-rail and engaging said traveler-body, a pair of gears carried by said traveler-body and engaging each other, a pair of feed-rolls, each rotary with one of said gears, and a rack normally engaging the following one of said gears.

2. The combination of a guide-rail having a flat upper surface, a traveler-body having a lateral opening, the upper surface of which is flat and rests upon the upper surface of said rail, a traveling belt or chain arranged at the rear of said rail and engaging said traveler, a pair of gears carried by said traveler and engaging each other, a pair of feed-rolls each rotary with one of said gears, and a rack to engage the following one of said gears.

3. The combination of a guide-rail having a flat upper surface, a traveler-body having an opening from side to side across the back thereof; adapted to receive said guide-rail, means for closing said opening back of said rail, said traveler-body being adapted to swivel on said rail, a traveling belt or chain arranged at the rear of said rail and engaging said traveler, a pair of gears carried by said traveler and engaging each other, a pair of feed-rolls each rotary with one of said gears, and a rack to engage the following one of said gears.

4. The combination of a guide-rail having a flat upper surface, a traveler-body having an opening from side to side across the back thereof, adapted to receive said guide-rail, a pin passing down through said traveler and opening back of said rail to retain said traveler on said rail, said traveler being adapted to swivel on said rail, a traveling belt or chain arranged at the rear of said rail and engaging said traveler, a pair of gears carried by said traveler and engaging each other, a pair of feed-rolls each rotary with one of said gears, and a rack to engage the following one of said gears.

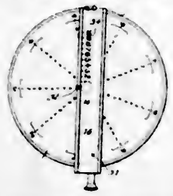
5. The combination of a guide-rail having a flat upper surface, a traveler-body having an opening from side to side across the back thereof adapted to receive said guide-rail, said traveler being adapted to swivel on said rail, pins passing down through said traveler and opening in front of and back of said rail and having flattened surfaces to bear against said rail, said pins being free to turn in said traveler when said traveler swivels and to bear upon the front and rear of said rail when said traveler is in either of its operative positions, a traveling belt or chain arranged at the rear of said rail and engaging said traveler, a pair of gears carried by said traveler and engaging each other, a pair of feed-rolls, each rotary with one of said gears, and a rack to engage the following one of said gears.

6. The combination of a guide-rail, a traveler provided with a slot having enlarged upper and lower ends and a gradually-contracted portion midway between the ends, a traveling belt or chain having a pin to engage said slot, a pair of gears carried by said traveler and engaging each other, a rack adapted to engage the following one of said gears and feed-rolls each rotary with one of said gears.

7. The combination of a supporting-bar, provided with a longitudinal T-slot, a bolt having a head arranged in said slot and laterally movable therein, a roll-stand having a transverse rib or projection to rest on said supporting-bar and having a hole to surround said bolt and a nut to engage said bolt and to clamp said stand against said bar.

8. The combination of guide-rail stands, a guide-rail, a traveler supported on and turning with said rail, said rail being adapted to turn in said stands but provided with means for preventing its longitudinal movement therein.

812,864. **GAME-RECORDING DEVICE.** AARON S. NICHOLS, Boston, Mass. Filed Apr. 22, 1904. Serial No. 204,337.



Claim.—1. The apparatus for recording game-scores consisting of a holder, a score-card adjustable in said holder for the different innings but otherwise stationary therein, and means upon the holder adapted to make a separate record upon the cord of each of a plurality of plays or strokes in each inning.

2. The apparatus for recording game-scores consisting of a holder, a score-card adjustably positioned in the holder for the different innings but otherwise stationary therein, means carried by the holder and adapted to make a separate record upon the card of each of a plurality of plays or strokes in each inning, and a device movable by the player and serving to actuate said recording means.

3. The apparatus for recording game-scores consisting of a circular holder, a circular score-card adjustably positioned in said holder for the different innings, but otherwise stationary therein, and means upon the holder adapted to make a separate record of each of a plurality of plays or strokes in each inning.

4. The apparatus for recording game-scores consisting of a holder, a score-card having separate spaces for the different innings and adjustably held in the holder, and means for making a separate record of each stroke or play occurring in an inning in the proper inning-space and adapted to make a plurality of such records depending upon the number of strokes in the inning.

5. The apparatus for recording game-scores consisting of a holder, a score-card which is both adjustable in and removable from the holder and which is divided into inning-spaces, and means carried by the holder for making a separate record of each of a plurality of strokes occurring in an inning.

6. The apparatus for recording game-scores consisting of a holder, a score-card which is both adjustable in and removable from the holder, a series of devices stationarily located in the holder and each adapted to record a separate stroke, and a device movable by the player and serving to actuate all or any portion of such devices necessary to record a plurality of plays occurring in an inning.

7. The apparatus for recording game-scores consisting of a circular holder, a circular score-card which is both adjustable in and removable from the holder, and which is divided into inning-spaces, and a series of recording devices each adapted to record a separate play and the series being adapted to record a plurality of plays in each inning-space.

8. The apparatus for recording game-scores consisting of a score-card, a holder for such card, means for recording upon the card, and devices for actuating the recording means, said recording means consisting of a series of spring puncturing-points, arranged in a straight line.

9. The apparatus for recording game-scores consisting of a stationary score-card, a holder for such card, means for recording upon the card, and devices for actuating the recording means, said recording means consisting of spring puncturing-points, arranged in a straight line adapted to be operated successively by the actuating devices.

10. The apparatus for recording game-scores consisting of a stationary score-card, a holder for such card, means for recording upon the card, and devices for actuating the recording means, said recording means consisting of spring puncturing-points arranged in a straight line, and said actuating devices being adapted to operate the points in successive order.

11. The combination in a portable game-recorder, of a holder, a series of recording devices, for recording the separate plays occurring in an inning, means for actuating the said recording devices in the order in which the plays occur, and a score-card adapted to be adjustably positioned in said holder for the different innings and having inning-spaces, each of such spaces being provided with numbers for indicating the several plays occurring in the inning, and the recording devices being adapted to make their records adjacent to such numbers.

12. The combination in a portable game-recorder, of a suitable holder, a series of recording devices for recording the plays, means for actuating said recording devices and a score-card having inning-spaces which are provided with numbers arranged in radial lines, the card being adapted to be adjusted for the different innings.

13. The combination in a portable game-recorder, of a suitable holder, a series of recording devices for recording the plays, means for actuating said recording devices successively in the order of the plays, and a score-card having inning-spaces which are provided with numbers arranged in radial lines, the card being adjustable for the different innings.

14. The combination in a portable game-recorder of a suitable holder, a score-card adjustable in the holder and having inning-spaces provided with numbers or characters in radial lines for indicating the different plays, a series of recording devices also arranged in radial lines and means for actuating said recording devices successively.

15. The combination in a portable game-recorder of a suitable holder, a circular score-card adjustable around its axis in the holder and having inning-spaces provided with numbers or characters in radial lines for indicating the different plays, a series of recording devices also arranged in radial lines and means for actuating said recording devices successively.

16. The game-recorder having a stationary circular score-card divided into radial inning-spaces, a holder therefor, a series of play-recording devices arranged radially of the card, and means for actuating said devices in successive order whereby a record may be made of all the plays occurring in an inning in a radial line upon the card.

17. The game-recorder having a stationary score-card, a holder therefor, a series of play-recording devices adapted to make records in a straight line and in successive order upon the card, and means adapted to actuate said recording devices one by one.

18. The game-recorder having a stationary score-card, a holder therefor, a series of play-recording devices arranged in a straight line across the card and adapted to print in the same straight line, a slide moving in line with the recording devices and actuating the same in successive order, and means for operating said slide.

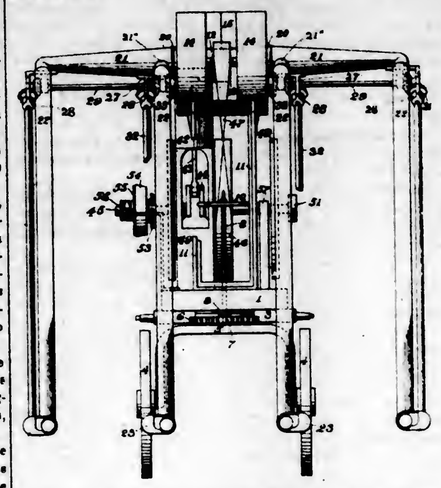
19. The game-recorder having a score-card, a holder therefor, and a series of play-recording devices, a slide for actuating the recording devices and means for imparting a step-by-step movement to said slide.

20. A game-recorder having means for making a permanent and separate serial record upon a card of the plays occurring in each of a plurality of innings, each inning-record forming a separate series upon the card, and an indicator actuated by and moving with the recording means and adapted to show at any stage of the game the number of plays made in any inning while the inning is being played.

812,865. **COTTON-PICKING MACHINE.** JOSEPH NESBIT, Argo, Miss. Filed June 24, 1905. Serial No. 266,526.

Claim.—1. In a cotton-picking machine, the combination of a suction-tube, a casing at the end thereof with an opening at the mouth of said tube, and shears with their cutting edges near the mouth of said tube and the opening of said casing.

2. In a cotton-picking machine, the combination of a suction-tube having a mouth for receiving cotton from the boll, and shears located adjacent to said mouth for assisting in separating the cotton from the plant.



3. In a cotton-picking machine, the combination of a suction-tube having a mouth for receiving cotton from the boll, shears located adjacent to said mouth for assisting in separating the cotton from the plant, and means for continuously operating said shears.

4. In a cotton-picking machine, the combination of a suction-tube having a mouth for receiving cotton from the boll, shears located adjacent to said mouth for assisting in separating the cotton from the plant, an engine for driving the machine, and mechanism connected up between the machine and the movable blade of the shears.

5. In a cotton-picking machine, the combination of a suction-tube, a casing at the end thereof with an opening at the mouth of said tube, and shears with their cutting edges near the mouth of said tube and the opening of said casing, one blade of the shears being movable relatively to the casing and the cutting edge of the other blade being formed upon said casing.

6. In a cotton-picking machine, the combination of a suction-tube having a mouth for receiving cotton from the boll, shears located adjacent to said mouth for assisting in separating the cotton from the plant, an engine for driving the machine, and mechanism connected up between the machine and the movable blade of the shears, said mechanism consisting of gearing, a flexible shaft connecting said gearing and one of the blades of said shears, and a driving connection between said engine and said gearing.

7. In a cotton-picking machine, the combination of a suction-tube having a mouth for receiving cotton from the boll, shears located adjacent to said mouth for assisting in separating the cotton from the plant, an engine for driving the machine, mechanism connected up between the machine and the movable blade of the shears, said mechanism consisting of gearing, a flexible shaft connecting said gearing and one of the blades of said shears, a driving connection between said engine and said gearing, a fan-casing, a pipe extending therefrom, and brackets attached to said pipe and supporting said gearing, said pipe communicating with said suction-tube.

8. In a cotton-picking machine, the combination of a pneumatic tube, a casing at the end thereof, with an opening at the mouth of said tube, and shears with their cutting edges near the mouth of said tube and the opening of said casing.

812,866. **MEANS FOR PREVENTING THEFT OF BRASSES FROM RAILWAY JOURNAL-BOXES.** EDWARD J. NOELETT, Chicago, Ill. Filed July 20, 1904. Serial No. 216,867.

Claim.—1. The combination with a journal-box, having oppositely-disposed seats on the inner faces of the side walls thereof of a retractable bolt engaged at its end in said seats.

2. The combination with a car journal-box, its journal and brasses of longitudinally-extensible means adapted to engage in

seats in the side walls of the box and acting to prevent removal of the

front and rear stops, tandem-arranged springs, front and rear followers said intermediate followers and the front and rear followers respec- ing frame pivotally connected at its rear end to said main frame, a

seats in the side walls of the box and acting to prevent removal of the brasses.

3. The combination with a car journal-box of locking mechanism therein engaging the inner face of each side wall and adapted to retain the brass therein.

4. The combination with a car journal-box having inwardly-opening seats in the side walls thereof of an expansible locking-bolt adapted to engage at its ends in said seats and means for decreasing the length of the bolt to permit its removal.

5. The combination with a journal-box provided with inwardly-opening seats in the side walls thereof of an extensible locking-bolt engaged at its ends therein beyond and extending below the bearing and means for retracting one end of the bolt from its seat.

6. In a car journal-box having inwardly-opening seats in the opposite sides thereof beyond the end of and adjacent the upper side of the journal of a longitudinally-retractable locking-bolt adapted to fit in said seats and acting to prevent the removal of the brasses.

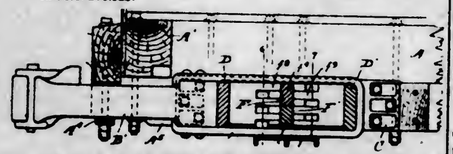
7. The combination with a journal and the brass therefor of a journal-box having an inwardly-opening seat in each side thereof, a spring locking-bolt adapted to be secured at its end in said seats adjacent the ends of the brass, and key-operated means adapted to retract one end of the bolt from its seat.

8. In a journal-box, an expansible locking mechanism adapted to engage the inner surface of the sidewalls of the box and means for withdrawing one end of the same from such engagement.

9. In a device of the class described, the combination with a journal-box of a detachable lock comprising a sheet-metal casing and a key-operated spring-bolt slidably secured therein and adapted to engage in the sides of said journal-box.

10. The combination with a journal-box of a lock comprising a strong sheet-metal casing, a rigid bolt in one end thereof, a slidable spring-controlled bolt in the other, the inner ends of said bolts overlapping said slidable bolt adapted to be retracted by a key.

812,867. TANDEM-SPRING DRAFT-RIGGING FOR RAILWAY-CARS. JOHN F. O'CONNOR, Chicago, Ill., assignor to W. H. Miner Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 5, 1905. Serial No. 276,923.



Claim.—1. In a tandem-spring draft-rigging, the combination with the draw-bar and draw-bar strap, of side plates or stop-castings having front and rear stops, tandem-arranged springs, a front follower bearing against the front end of the front spring, a rear follower bearing against the rear end of the rear spring and two intermeshing, flush-fitting, telescoping skeleton intermediate followers, one integral with the front follower and the other integral with the rear follower, the two intermediate, flush-fitting followers both engaging the adjacent ends of each spring when the springs are not compressed, and sliding or telescoping in respect to each other to compress the springs, and integral interfitting longitudinally-extending tongues connecting said intermediate followers and the front and rear followers respectively substantially as specified.

2. In a tandem-spring draft-rigging, the combination with the draw-bar and draw-bar strap, of side plates or stop-castings having front and rear stops, tandem-arranged springs, front and rear followers, and two intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, and integral interfitting longitudinally-extending tongues connecting said intermediate followers and the front and rear followers respectively substantially as specified.

3. In a tandem-spring draft-rigging, the combination with the draw-bar and draw-bar strap, of side plates or stop-castings having front and rear stops, tandem-arranged springs, front and rear followers, and two intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, and two interfitting sets of integral tongues, one set integral with one of said intermediate followers for connecting it with the front follower, and the other set integral with the other intermediate follower for connecting it with the rear follower, substantially as specified.

4. In a tandem-spring draft-rigging, the combination with the draw-bar and draw-bar strap, of side plates or stop-castings having front and rear stops, tandem-arranged springs, front and rear followers, and two intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, said intermeshing skeleton intermediate followers being integral one with the front follower, and the other with the rear follower, and integral interfitting longitudinally-extending tongues connecting said intermediate followers and the front and rear followers respectively substantially as specified.

5. In a tandem-spring draft-rigging, the combination with the draw-bar and draw-bar strap, of side plates or stop-castings having front and rear stops, tandem-arranged springs, front and rear followers, and two intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, said intermeshing skeleton intermediate followers having each an H-shaped continuous cross-bar and a slotted cross-bar, substantially as specified.

6. In a tandem-spring draft-rigging, the combination with tandem-arranged springs, of front and rear followers, and two complementing or intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart to compress the springs, whereby the adjacent ends of the two tandem springs are adapted to be brought close together or be separated a distance only equal to the necessary thickness of one follower, and integral interfitting longitudinally-extending tongues connecting said intermediate followers and the front and rear followers respectively substantially as specified.

7. In a tandem-spring draft-rigging, the combination with tandem springs, front and rear followers, and two complementing or intermeshing skeleton intermediate followers, one of said intermediate skeleton followers being integral with the front follower and the other with the rear follower, and integral interfitting longitudinally-extending tongues connecting said intermediate followers and the front and rear followers respectively substantially as specified.

8. In a tandem-spring draft-rigging, the combination with tandem springs, front and rear followers, and two complementing or intermeshing skeleton intermediate followers, one of said intermediate skeleton followers being integral with the front follower and the other with the rear follower, one of said intermediate followers having extension-legs to limit the follower movement and the compression of the springs, substantially as specified.

9. In a tandem-spring draft-rigging, the combination with tandem springs, front and rear followers, and two complementing or intermeshing skeleton intermediate followers, one of said intermediate skeleton followers being integral with the front follower and the other with the rear follower, said intermediate followers having interfitting extension-legs engaging shoulders on the front and rear followers to limit the movement and the compression of the springs, substantially as specified.

10. In a tandem-spring draft-rigging, the combination with the draw-bar and draw-bar strap, of side plates or stop-castings having front and rear stops, tandem-arranged springs, front and rear followers, and two intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed and to telescope or slide apart when the springs are compressed, a plurality of integral tongue connections between one of said intermediate followers and the front follower and a plurality of integral tongue connections between the other intermediate follower and the rear follower, said tongue connections of the one intermediate follower interfitting and alternating with those of the other intermediate follower substantially as specified.

11. In a tandem-spring draft-rigging, the combination with tandem-arranged springs, of a front follower having an integral bottom plate or web, a rear follower having an integral bottom plate or web and two complementing or intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed, and to telescope or slide apart to compress the springs, and integral interfitting longitudinally-extending tongues connecting said intermediate followers and the front and rear followers respectively substantially as specified.

12. In a tandem-spring draft-rigging, the combination with tandem-arranged springs, of a front follower having in integral bottom plate or web, a rear follower having an integral bottom plate or web and two complementing or intermeshing skeleton intermediate followers adapted to shut together when the springs are not compressed, and to telescope or slide apart to compress the springs, the ends of said integral bottom plates or webs on the front and rear followers abutting together to limit the compression of the springs, substantially as specified.

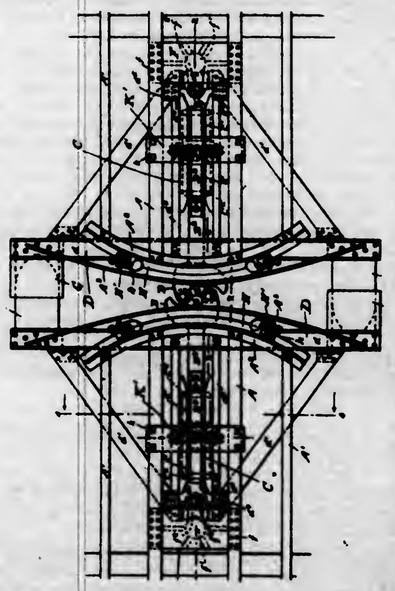
13. In a tandem-spring draft-rigging, the combination with tandem springs, front and rear followers having integral bottom plates or webs and integral side walls, and two complementing or intermeshing skeleton intermediate followers integral one with the front follower and the other with the rear follower, and integral interfitting longitudinally-extending tongues connecting said intermediate followers with the front and rear followers, respectively, substantially as specified.

14. In a tandem-spring draft-rigging, the combination with tandem springs, front and rear followers having integral bottom plates or webs and integral side walls, and two complementing or intermeshing skeleton intermediate followers integral one with the front follower and the other with the rear follower, and integral interfitting longitudinally-extending tongues connecting said intermediate followers with the front and rear followers respectively, said intermediate followers having interfitting extension-legs, substantially as specified.

15. In a tandem-spring draft-rigging, the combination with tandem-arranged springs, front and rear followers, and two interfitting telescoping H-shaped and slotted cross-bar intermediate followers, substantially as specified.

16. In a tandem-spring draft-rigging, the combination with tandem-arranged springs, front and rear followers, and two interfitting telescoping H-shaped and slotted cross-bar intermediate followers, one of said intermediate followers being integral with the front follower and the other with the rear follower, substantially as specified.

812,868. DRAFT APPLIANCE FOR RAILWAY-CARS. JOHN F. O'CONNOR, Chicago, Ill., assignor to W. H. Miner Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 23, 1905. Serial No. 284,789.



Claim.—1. In a railway-car coupling and draft appliance, the combination with the main frame of the car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler and draft-rigging mechanism mounted upon and carried by said supplemental swinging frame and a socket and plunger at the opposite sides of the swinging frame adapted to engage the coöperating plunger and socket of the swinging frame of the adjacent car to turn the two swinging frames into parallelism and the couplers and draw-bars into alinement with each other as the cars approach, substantially as specified.

2. In a railway-car coupling and draft appliance, the combination with the main frame of the car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler and draft-rigging mechanism mounted upon and carried by said supplemental swinging frame, a curved track and hangers for supporting the front end of said supplemental swinging frame, and a socket and plunger at the opposite sides of the swinging frame adapted to engage the coöperating plunger and socket of the swinging frame of the adjacent car to turn the two swinging frames into parallelism and the couplers and draw-bars into alinement with each other as the cars approach, substantially as specified.

3. In a railway-car coupling and draft appliance, the combination with the main frame of the car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler and draft-rigging mechanism mounted upon and carried by said supplemental swinging frame, means for centering said supplemental swinging frame with the main frame, and a socket and plunger at the opposite sides of the swinging frame adapted to engage the coöperating plunger and socket of the swinging frame of the adjacent car to turn the two swinging frames into parallelism and the couplers and draw-bars into alinement with each other as the cars approach, substantially as specified.

4. In a railway-car coupling and draft appliance, the combination with the main frame of the car, of a supplemental swinging frame pivotally connected at its rear end to said main frame, a coupler draft-rigging mechanism mounted upon and carried by said supplemental swinging frame, a curved track and hangers for supporting the front end of said supplemental swinging frame, and means for centering said supplemental swinging frame with the main frame, and a socket and plunger at the opposite sides of the swinging frame adapted to engage the coöperating plunger and socket of the swinging frame of the adjacent car to turn the two swinging frames into parallelism and the couplers and draw-bars into alinement with each other as the cars approach, substantially as specified.

5. The combination with a car-frame, of a supplemental draw-bar and draft-rigging carrying frame pivotally connected to the main frame, and a coupler draw-bar and cushioning device mounted upon and carried by said supplemental frame, said supplemental frame having socket and plunger devices adapted to engage similar devices on the adjacent car to turn said supplemental frame on its pivot so as to bring the draw-bar carried thereby into alinement with the draw-bar of the adjacent car, substantially as specified.

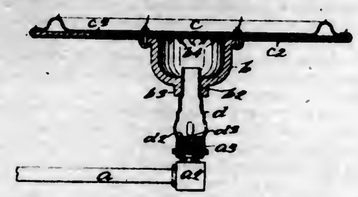
6. The combination with a car-frame, of a supplemental draw-bar and draft-rigging carrying frame pivotally connected to the main frame, and a coupler draw-bar and cushioning device mounted upon and carried by said supplemental frame, and means for centering said supplemental frame with the car-frame, said supplemental frame having socket and plunger devices adapted to engage similar devices on the adjacent car to turn said supplemental frame on its pivot so as to bring the draw-bar carried thereby into alinement with the draw-bar of the adjacent car, substantially as specified.

7. The combination with the car-frame, of a supplemental triangular frame pivotally connected to the main frame and provided with parallel bars, side plates or stop-castings secured to said parallel bars, followers, a cushioning device and a draw-bar mounted upon and carried by said supplemental frame, substantially as specified.

8. The combination with the car-frame, of a supplemental triangular frame pivotally connected to the main frame and provided with parallel bars, side plates or stop-castings secured to said parallel bars, followers, a cushioning device, a draw-bar mounted upon and carried by said supplemental frame, and a centering device for said supplemental frame, substantially as specified.

9. The combination with the car-frame, of a supplemental triangular frame pivotally connected to the main frame and provided with parallel bars, side plates or stop-castings secured to said parallel bars, followers, a cushioning device, a draw-bar mounted upon and carried by said supplemental frame, a centering device for said supplemental frame, and means for turning said supplemental frame on its pivot to bring the draw-bar carried thereby into alinement with the draw-bar of the adjacent cars the cars approach each other for coupling on a curve, substantially as specified.

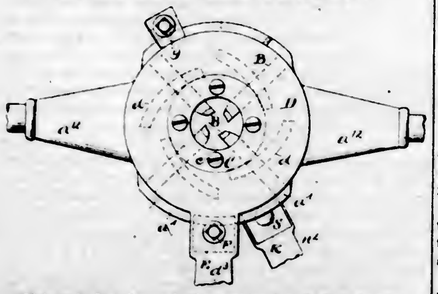
812,869. HEATER. ANNA O'HARE and CHARLES B. WESTON, Brooklyn, N. Y. Filed July 28, 1905. Serial No. 271,578.



Claim.—1. A gas-heater comprising a cup-shaped member having a horizontal cap member secured to the top thereof, said cup-shaped member being provided at the top thereof and beneath the cap member with a plurality of recesses forming ports or passages, and said cup-shaped member being also provided in the bottom thereof with an opening and a Bunsen-burner tube adapted to be inserted into said opening, substantially as shown and described.

2. A gas-heater comprising a cup-shaped member having a horizontal cap member secured to the top thereof, said cup-shaped member being provided at the top thereof and beneath the cap member with a plurality of recesses forming ports or passages, and said cup-shaped member being also provided in the bottom thereof with an opening and Bunsen-burner tube adapted to be inserted into said opening, the cap member being also composed of a bottom part of asbestos and a top part of metal, substantially as shown and described.

812,870. DIE-STOCK. HERMAN W. OSTER, Cleveland, Ohio, assignor to The Oster Manufacturing Company, Cleveland, Ohio, a Corporation of Ohio. Filed Feb. 6, 1905. Serial No. 244,265.



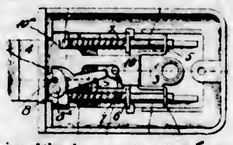
Claim.—1. In a die-stock, the combination of a body having an outwardly-projecting flange, adjustable dies in said body, a plate having means thereon for adjusting said dies and a portion extending over said flange, a clamp beneath such portion of the plate, said clamp having an outer end engaging said plate, an intermediate portion for the reception of a bolt, and an inner end portion adapted to engage said flange, and a bolt extending through the portion of the plate adjacent to said flange and threaded into the intermediate portion of said clamp, substantially as specified.

2. In a die-stock, the combination of the body having a pair of flanges thereon, said flanges projecting outwardly from opposite portions of said body, adjustable dies within said body, a plate rotatably fitted on said body and having means for adjusting said dies, said plate having a handle extending over one of said flanges, a clamp carried by said handle for engaging the proximate flange, a projection from said plate above the other flange, and an adjustable stop member carried by the last-mentioned flange for engagement by said projection, substantially as specified.

812,871. LOCK AND LATCH. PAUL PAPENFOTH, New Britain, Conn., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Feb. 13, 1905. Serial No. 245,817.

Claim.—1. In a device of the character described, a movable bolt, an independently-movable piece carried thereby, a dogging device carried by said bolt and operable by said independently-movable piece, a manually-operative device, a connection between the same and said bolt, said connection also operating said dogging device.

2. In a device of the character described, a movable bolt, a dogging device carried thereby, an independently-movable member carried by said bolt and engaging said dogging device to operate the same, and a latch-slide operatively connected with said dogging device and said bolt.



3. In a device of the character described, a movable bolt, a dogging device carried thereby, an independently-movable member carried by said bolt and engaging said dogging device to operate the same, a latch-slide operatively connected with said dogging device and said bolt, and means to cause said latch-slide to operate said dogging device in advance of said bolt.

4. In a device of the character described, a movable bolt, an independently-movable piece carried at the end thereof, and normally spaced apart slightly therefrom, a dogging device connected to said independently-movable piece, a manually-controllable operating device, a connection between said operating device and said bolt and dogging device, whereby said dogging device may be released and the bolt retracted.

5. In a device of the character described, a movable bolt, an end piece carried thereby, a dogging device carried by said bolt, a connection between said dogging device and said end piece, means for normally moving the end piece in a direction to set the dogging device, a manually-controllable slide operatively connected with both the bolt and said dogging device whereby the latter may be released and the former retracted.

812,872. INCANDESCENT ELECTRIC LAMP. HERSCHEL C. PARKER, New York, N. Y., assignor to Parker-Clark Electric Company, Jersey City, N. J., a Corporation of New Jersey. Filed Apr. 8, 1905. Serial No. 254,587.

Claim.—1. An incandescent electric lamp, comprising a tube of highly-refractory material which is permeable to light, a highly-refractory conductive film on the inner surface of the tube, and connections at the tube ends for the said conductive film.

2. An electric incandescent lamp, comprising a highly-refractory light-permeable tube, a highly-refractory conductive film on the inner surface of the tube, a non-conducting packing for the tube, and electrical connections at the tube ends.

3. An electric incandescent lamp, comprising a tube of highly-refractory material which is permeable to light, a conducting-film on the inner surface of the tube said film extending the whole length of the tube, a non-conducting packing for the tube, and electrical connections at the tube ends.

4. An electric incandescent lamp, comprising a tube of highly-refractory light-permeable material, a conducting-film covering the inner surface of the tube, a packing for the tube, the said packing being essentially of the same coefficient of expansion as the tube, and electrical connections at the tube ends.

5. An electric incandescent lamp, comprising a tube of highly-refractory material which is permeable to light, a conducting-film on the inner surface of the tube, a non-conducting packing filling the tube except at points near the ends, a packing of a relatively good conductor at the tube ends, leading-in wires connecting with the conductive packing, and a seal for the tube ends.

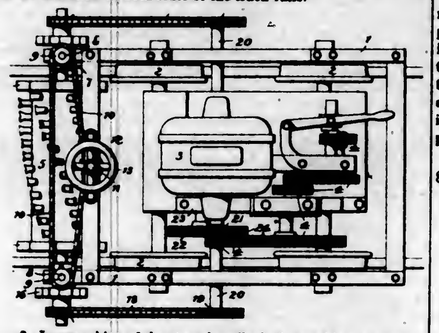
6. An incandescent electric lamp, comprising a hollow member of highly-refractory material which is permeable to light, a highly-refractory conductive lining for the member, and electrical connections at the ends of the member.

7. An incandescent electric lamp, comprising a tube of highly-refractory material which is permeable to light, a refractory conductive lining for the tube, a non-conductive core filling the bore of the tube, and electrical connections at the tube ends.

8. An incandescent lamp comprising a body portion of highly-refractory light-permeable material, and a film of iridium on the said body.

812,873. ICE-CUTTER FOR SURFACE RAILWAYS. WILLIAM H. PERRY, Concord, N. H. Filed Oct. 6, 1905. Serial No. 281,433.

Claim.—1. In a machine of the class described, the combination with a truck-frame, and a driving element associated therewith, of a rotary drum carried by said frame, gearing interposed between the driving element and said drum for rotating the latter, and cutters carried by said drum and arranged thereon at points to attack the ice and snow at both sides of the track-rails.



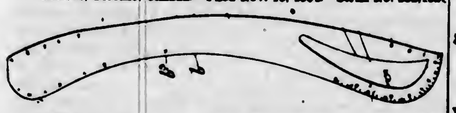
2. In a machine of the class described, the combination with a truck-frame, and a driving element associated therewith, of a rotary drum carried by said frame, gearing interposed between the driving element and said drum for rotating the latter, cutters carried by said drum and arranged thereon at points to attack the ice and snow at both sides of the track-rails, and means for adjusting the position of the drum and cutters in relation to the track-bed.

3. In a machine of the class described, the combination with a truck-frame, and a driving element associated therewith, of a rotary drum journaled upon said frame, gearing interposed between the driving element and said drum for rotating the latter, cutting elements arranged in spiral relation upon said drum and extending from end to end thereof, and cutting-disks also carried by the drum and arranged in such relation to the track-rails as to attack the ice and snow at both sides of the latter.

4. In a machine of the class described, the combination with a truck-frame, and a driving element associated therewith, of a rotary drum journaled upon said frame, gearing interposed between the driving element and said drum for rotating the latter, cutting elements arranged in spiral relation upon said drum and extending from end to end thereof, cutting-disks also carried by the drum and arranged in such relation to the track-rails as to attack the ice and snow at both sides of the latter, and means for adjusting the position of the drum and cutters in relation to the track-bed.

5. In a machine of the class described, the combination with a truck-frame, and a driving element associated therewith, of a drum journaled upon said frame, a series of cutting elements arranged in spiral relation upon said drum and extending from end to end thereof, cutting-disks also carried by said drum and arranged at points to attack the ice and snow at both sides of the track-rails, a shaft journaled upon the truck-frame and geared to the driving element, and gearing interposed between said shaft and said drum for rotating the latter.

812,874. GARMENT-DESIGNING CURVE-RULE. ERNEST L. PHELPS, Toronto, Canada. Filed Nov. 10, 1904. Serial No. 232,152.



Claim.—1. A curve-rule having one edge formed with an outward bend made up from end to end of two flat compound curves and the opposite edge formed at one end with a straight portion and a continuing comparatively quick curve and the opposite end of a comparatively quick curve, both of which curves are joined by a comparatively flat curve having an inward bend as and for the purpose specified.

2. A curve-rule having one edge formed with an outward-curved bend made up from end to end of two flat compound curves and the opposite edge formed at one end with a straight portion and a continuing comparatively quick curve and the opposite end of a comparatively quick curve, both of which curves are joined by a comparatively flat curve having an inward bend, both edges being provided with indexing-points at and toward each end at desired distances apart on both sides of the rule and intermediate indexing-points, one near each edge and on both sides of the rule as and for the purpose specified.

3. A curve-rule having one edge formed with an outward bend made up from end to end of two flat compound curves and the opposite edge formed at one end with a straight portion and a continuing comparatively quick curve and the opposite end of a comparatively quick curve, both of which curves are joined by a comparatively flat curve having an inward bend and an opening at the larger end of the rule formed of two simple curves meeting at the outer end in a point and having the opposite end rounded as and for the purpose specified.

812,875. TOP-ROLL SADDLE. GEORGE L. PERRIN, Manchester, N. H., assignor to The Whitin Machine Works, Whitinsville, Mass., a Corporation of Massachusetts. Filed Apr. 14, 1905. Serial No. 256,233.

Claim.—1. In a top-roll saddle of the character described, an upper member, a spring secured at one end to the top of said member and provided with suitable perforations, a weight-stirrup embracing or surrounding said member and spring by means of a suitable opening in the stirrup, and resting directly on the saddle, and a pin or projection adapted to extend down from the stirrup into one of the perforations in the spring and be released therefrom by pressing said spring out of engagement therewith.

2. In a top-roll saddle of the character described, an upper member, a spring secured at one end to the top of said member and formed up centrally into a portion which is normally raised above the top of the member, a weight-stirrup embracing or surrounding said member and resting directly on the saddle, and means for engaging said weight-stirrup with the spring, disengagement being produced by pressing on said spring.

3. In a top-roll saddle of the character described, an upper member provided with the curved head *k* formed on its surface with the longitudinal guiding-groove *k'*, a spring secured at its rear end to said member, formed up centrally into a normally raised portion provided with suitable perforations and with its forward end resting in said groove, and a weight-stirrup embracing said member and spring by means of a suitable opening and provided with an engaging pin *v* adapted to extend down into one of said perforations and to be released therefrom by pressure on the raised portion of the spring.

4. In a top-roll saddle of the character described, an upper member, a spring secured at one end to the top of said member and provided with the normally raised portion *n'* having perforations *p*, and the weight-stirrup provided with the opening *s* narrowed at its lower end whereby shoulders *t* are produced and at its upper end whereby shoulders *t'* are produced, the upper end of said opening being provided with the downwardly-extending pin *v* adapted to engage the spring by means of one of its perforations.

812,876. COLLAR-FOUNDATION. DAVID POTTS, Three Oaks, Mich., assignor to Warren Featherbone Company, Three Oaks, Mich., a Corporation of Illinois. Filed Feb. 15, 1905. Serial No. 245,944.

Claim.—1. A collar-foundation comprising a series of upwardly-extending stiffening-strips spaced apart from each other and attached at the top to a downwardly-extending flexible flap, substantially as described.

2. A collar-foundation comprising a series of upwardly-extending stiffening-strips spaced apart from each other and attached at the top to a downwardly-extending flexible flap of textile fabric, substantially as described.

3. A collar-foundation comprising a bottom band, a series of upwardly-extending stiffening-strips fastened thereto and attached at the top to a downwardly-extending flexible flap, substantially as described.

4. A collar-foundation comprising a bottom band of stiffening material, a series of upwardly-extending stiffening-strips fastened

thereto and attached at the top to a downwardly-extending flexible flap, substantially as described.

5. A collar-foundation comprising a series of upwardly-extending stiffening-strips, a top band to which the upper ends of the stiffening-strips are fastened and a downwardly-extending flexible flap attached at its top to said top band, substantially as described.

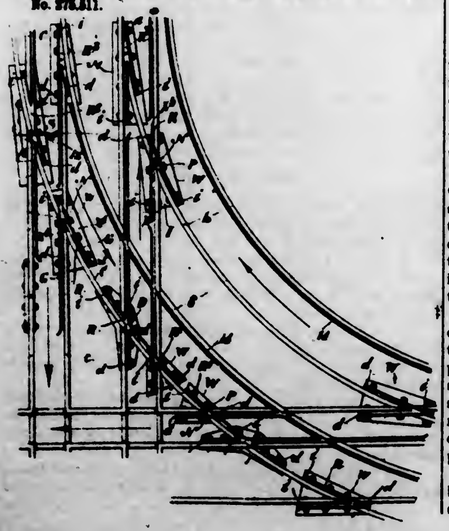
6. A collar-foundation comprising a series of upwardly-extending stiffening-strips, a top band of stiffening material to which the upper ends of the stiffening-strips are fastened and a downwardly-extending flexible flap attached at its top to said top band, substantially as described.

7. A collar-foundation comprising a bottom band, a series of upwardly-extending stiffening-strips fastened thereto, a top band and a downwardly-extending flexible flap, the flap and the upwardly-extending stiffening-strips being attached to the top band, substantially as described.

8. A collar-foundation comprising a bottom band, a series of upwardly-extending stiffening-strips fastened thereto, a top band of stiffening material and a downwardly-extending flexible flap, the flap and the upwardly-extending stiffening-strips being attached to the top band, substantially as described.

9. A collar-foundation comprising a bottom band of stiffening material, upwardly-extending stiffening-strips attached thereto, a top band of stiffening material to which the upper ends of said stiffening-strips are attached and a downwardly-extending flexible flap fastened at its top edge to the top band of stiffening material, substantially as described.

812,877. **RAILWAY-FROG FOR TURN-INS AND TURNOUTS.** REUBEN M. RANKIN, Los Angeles, Cal. Filed Aug. 24, 1905. Serial No. 275,611.

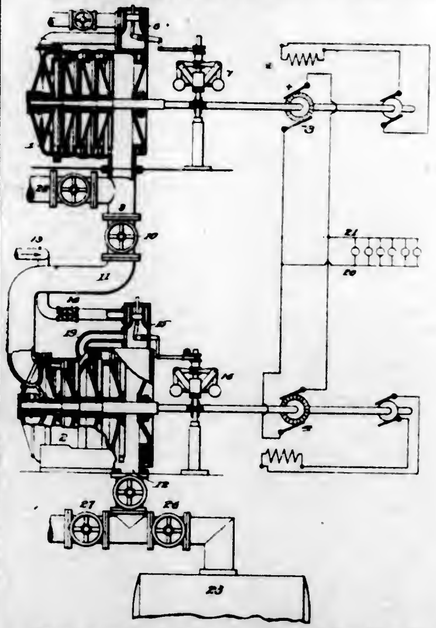


Claim.—1. A railway-frog provided with a foundation, a filler and a riser, and with rivet-holes therethrough, and rivets in said holes detachably fastening the parts together.

2. A railway-frog comprising rail-junctions and rail ends, risers adapted to protect said junctions and ends fastened to the inside of the rails, and an auxiliary riser fastened to the outside of the rails at the junction or ends.

3. A railway-frog comprising two intersecting rails, a riser secured at said intersection on the inside of said rails, an auxiliary riser on the outside of said rails at the intersection thereof, a clearance-space being in one of said rails, and an outside riser secured at said clearance-space.

812,878. **TURBINE-DRIVEN MACHINERY.** AUGUSTE C. H. RATEAU and GASTON SAUTTER, Paris, France, assignors to Rateau Turbine Company, Chicago, Ill., a Corporation of West Virginia. Filed Aug. 17, 1903. Serial No. 169,674.



Claim.—1. The combination with a plurality of turbines connected in series with respect to the passage of steam, of a corresponding number of power-absorbing machines driven by said turbines, a connection between said driven machines to maintain approximately a fixed relative speed thereof, and a governor mechanism responsive to changes in speed of the system controlling the admission of steam to the first turbine of the series.

2. The combination with a plurality of turbines and means for conveying motive fluid through said turbines in series to operate the same as a unit of motive power, of a corresponding number of power-transforming machines each driven by one of said turbines, said machines being connected in parallel with respect to the delivery of their output, and a single governor-mechanism responsive to changes in the speed of the system controlling the admission of motive fluid to the first turbine of the series.

3. The combination with two or more turbines and means for conveying motive fluid through said turbines in sequence to operate the same as a unit of motive power, of a corresponding number of power-absorbing machines driven each by a corresponding one of said turbines, a regulator mechanism responsive to slight changes in speed of one of said turbines and arranged to control the admission of motive fluid to said series of turbines, and means for causing said driven machines to react mutually to distribute the total load in proportion to the power developed by the respective turbines.

4. The combination with high-pressure and low-pressure turbines, and means for passing motive fluid through said turbines in series to operate the same as a unit of motive power, of dynamo-electric generators driven each by a corresponding one of said turbines, and a main circuit to which said generators are connected in parallel, whereby the load upon said circuit at any instant is distributed between said generators in proportion to the power developed by their respective driving-turbines.

5. The combination with high-pressure and low-pressure turbines, and means for passing motive fluid through said turbines in series, of electric generators driven each by a corresponding turbine, a main circuit fed with current from said generators, and connections between said generators adapted to distribute the total load of said main circuit between said generators proportionately to the power developed by their corresponding driving-turbines.

6. The combination with electric generators connected in parallel to a main circuit, of high-pressure and low-pressure turbines each driving a corresponding generator, means for causing motive fluid to pass through said turbines in series to operate the same as a unit, an obturator controlling the supply of motive fluid to the first turbine of the series, and a governor for operating said obturator, responsive to changes in the total load on said main circuit.

7. The combination with a plurality of turbines connected in series with respect to the passage of motive fluid therethrough, of a corresponding number of power-absorbing machines driven by said turbines, a connection between said driven machines, means for admitting additional motive fluid to an intermediate point in the turbine system, and a governor mechanism responsive to an abnormal fall of speed, arranged to control the admission of such additional motive fluid.

8. The combination with a plurality of turbines connected in series, of a corresponding number of power-transforming machines driven by said turbines, a connection between said driven machines whereby they are caused to maintain approximately a fixed relative speed, a governor mechanism responsive to changes of speed of the system arranged to control the admission of motive fluid to the first turbine of the series, means for admitting additional motive fluid to an intermediate point in the turbine system, and a second governor mechanism responsive to an abnormal fall of speed consequent upon overload, arranged to control the admission of such additional motive fluid.

9. The combination with a plurality of turbines and means for passing steam through said turbines in series, of electric generators driven one by each turbine, said generators being connected in parallel, a governor mechanism responsive to changes in speed of one of said turbines, controlling the passage of steam to the first turbine of the series, means for supplying additional steam at an intermediate point in the turbine series, and a second governor mechanism responsive to an abnormal fall of speed consequent upon overload, arranged to control such additional steam-supply.

812,879. **FASTENING-HOOK.** CHARLES DE LOS RIOS, Hartford, Conn., assignor to Underwood Typewriter Company, New York, N. Y., a Corporation of New Jersey. Filed Aug. 26, 1905. Serial No. 275,940.

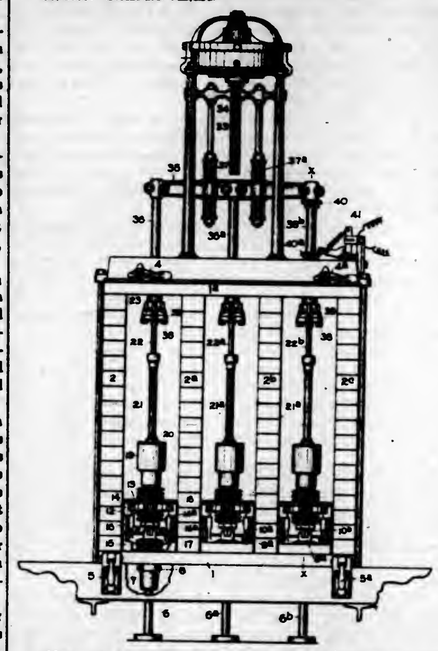
Claim.—1. A hook having a shank, and a bolt fitted around the shank and adapted to engage the point of the hook, said bolt constructed to slide onto or off from said shank.

2. A hook having a shank, and a bolt fitted around the shank and adapted to engage the point of the hook, said bolt constructed to slide onto or off from said shank, and the latter having an eye in its end, so that a screw or device upon which the hook is hung by means of said eye, may serve as a lock to prevent the bolt from becoming detached.

3. A flat hook struck up from sheet metal and having a shank formed with an eye in its end, the shank being as broad throughout as at the eye portion, and a flat sheet-metal bolt having members to clasp said shank, and constructed to slide upon the shank to close and open the hook.

4. A flat hook struck up from sheet metal and having a shank formed with an eye in its end, the shank being as broad throughout as at the eye portion, and a flat sheet-metal bolt having members to clasp said shank, and constructed to slide upon the shank to close and open the hook; said bolt constructed to slide past the point of the hook and to be sprung laterally thereby, so as to lock the hook closed.

812,880. **SWITCH OR CIRCUIT-BREAKER FOR HIGH-POTENTIAL CIRCUITS.** BROWN W. RICE, Jr., Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Dec. 30, 1899. Serial No. 742,134.



Claim.—1. Means for rupturing a high-potential current, comprising contacts, an inclosure around the points of contact adapted to store high pressure upon the separation of said contacts, a body of insulating liquid submerging the contacts, and quick-acting means for separating the contacts with a quick break and a long motion whereby the arc products are squeezed into small cross-section and the arc is stretched until ruptured.

2. Means for rupturing a high-potential current, comprising contacts, an inclosure around the points of contact adapted to store high pressure upon the separation of said contacts, a body of insulating liquid submerging the contacts, and quick-acting means for separating the contacts with a quick break and withdrawing one of them out of said liquid whereby the arc products are squeezed into small cross-section and the arc is stretched until ruptured.

3. Means for rupturing a high-potential current, comprising contacts, a metallic inclosure around the points of contact adapted to store high pressure upon the separation of said contacts, a body of insulating liquid submerging the contacts, a lining of insulating material for the inclosure extending above the level of the liquid to prevent jumping of an arc, and quick-acting means for quickly separating said contacts and withdrawing one of them from the liquid whereby the arc products are squeezed into small cross-section and the arc is stretched until ruptured.

4. Means for rupturing a high-potential current, comprising separable contacts, a small inclosure for the break-points of the contacts for confining the pressure produced by the arc so as to compress the arc into small cross-section as the contacts separate, an insulating liquid within said inclosure submerging said contacts, and means for separating said contacts with a quick break.

5. Means for rupturing a high-potential current, comprising contacts, a small vessel adapted to withstand great pressure containing an inelastic fluid insulator submerging the contacts, means for cushioning the pressure, and means for separating the contacts rapidly by a long movement whereby the arc is squeezed into a small cross-section of high resistance when the contacts are rapidly separated.

6. Means for rupturing a high-potential current, comprising contacts, a small oil vessel, a bath therein submerging said contacts when the circuit is closed, and power-driven means for rapidly sep-

arating the contacts with a long range of movement whereby the increase of pressure and wide quick separation of the contacts extinguish the arc.

7. A circuit-breaker or switch for opening circuits of high potential and large amperage comprising contacts, an oil-bath submerging the contacts, a small vessel containing said bath adapted to store high pressure, and an air-pocket in said vessel, small relatively to the volume of oil, whereby a sudden rise of pressure under heat of the arc compresses the arc into small cross-section and thereby admits of its easy extinguishment.

8. Means for rupturing a high-potential current, comprising separable contacts, an inclosure around the points of contact, a body of insulating liquid in said inclosure filling the greater portion thereof and leaving an air-space small relative to the volume of oil, and means for separating the contacts in oil and drawing one of them into the air within said inclosure.

9. Means for rupturing a high-potential current, comprising an inclosure, a body of insulating liquid contained therein, an apertured insulator for supporting said inclosure, a terminal extending through the aperture in said insulator into said inclosure, a contact in circuit therewith, a coöperating movable contact arranged to break therewith under the insulating liquid, and a support for said insulator embracing the exterior of the same.

10. An electric switch comprising two fixed contacts, two mechanically and electrically connected movable contacts adapted to be moved into and out of engagement with said fixed contacts, a separate inclosure for each break-point, a cover for each inclosure for rendering the same capable of withstanding high pressure and an insulating liquid in each of said inclosures submerging said break-points.

11. An electric switch comprising two fixed contacts, two mechanically and electrically connected movable contacts adapted to be moved into and out of engagement with said contacts, a separate inclosure for each break-point, a cover for each inclosure for rendering the same capable of withstanding high pressure, an insulating fluid in each of said inclosures submerging said break-points, and means for separating said contacts with a quick break.

12. Means for rupturing a high-potential current, comprising separable contacts, an inclosure about said contacts containing a liquid insulator, means for separating the contacts in said inclosure, means for contracting the arc in cross-section after a definite range of movement and means for preventing the expulsion of the liquid from the inclosure.

13. Means for rupturing a high-potential current comprising separable contacts, an inclosure about said separable contacts, a tube communicating with the chamber, and means for separating the contacts in said chamber and drawing one of them into said tube.

14. Means for rupturing a high-potential current comprising separable contacts, an oil-chamber about said separable contacts, a tube communicating with the chamber, and means for separating the contacts under oil and withdrawing one of them into said tube.

15. Means for rupturing a high-potential current, comprising separable contacts, an oil-chamber about said separable contacts, a tube communicating with the chamber, and means for withdrawing a contact from the oil into the tube when the circuit is opened.

16. Means for rupturing a high-potential current, comprising separable contacts, an oil-chamber about said separable contacts, a tubular extension closely embracing the movable terminal, and means for withdrawing said terminal from the oil into the extension when the circuit is opened.

17. Means for rupturing a high-potential current, comprising a chamber containing an insulating liquid, separable contacts submerged in said liquid when the circuit is closed, a tubular extension in which the movable contact is mounted above the liquid-line, and means for withdrawing the movable contact from the liquid.

18. Means for rupturing a high-potential current, comprising a metallic closed chamber about a single pair of separable contacts, an insulating-lining for said chamber, a movable contact, a narrow tubular connection into which the movable contact may recede, and means for producing a long movement of said contact in said tubular connection to rupture the circuit.

19. Means for rupturing a high-potential current, comprising a closed chamber about a single pair of separable contacts, an insulating-lining for the chamber, a movable contact, a tubular extension of the chamber of insulating material closely fitting the movable contact, and means for withdrawing the contact from the chamber into the tube.

20. Means for rupturing a high-potential current, comprising an inclosure about the separable contacts, a tubular extension communicating with said inclosure and closely fitting the movable contact adjacent to its connection with the inclosure, and means for separating the contacts in said chamber and drawing one of them into said tube.

21. A switch or circuit-breaker for high-potential currents, comprising multipolar separable contacts, independent substantially air-tight inclosures having solid insulating-walls for the several contacts, and quick-acting means for separating all poles simultaneously with a quick break.

22. A switch or circuit-breaker for high-potential currents, comprising multipolar separable contacts, an independent oil-chamber about each pair of contacts, said oil-chambers being so arranged as to prevent the arc from holding over between the different sets of multipolar contacts, and quick-acting means for separating all poles simultaneously with a quick break.

23. A switch or circuit-breaker for high-potential currents, comprising multipolar separable contacts, an independent closed oil-chamber around each pair of contacts, and quick-acting means for separating all poles simultaneously with a quick break.

24. A high-potential switch or circuit-breaker comprising circuit-terminals, a plurality of closed oil-pots containing an oil-bath for the circuit-terminals, and quick-acting means for moving a plurality of the circuit-terminals simultaneously to form a plurality of quick breaks under the oil.

25. A multiphase electric switch comprising a plurality of pairs of separable contacts, an independent inclosure for each pair, insulating liquid in each inclosure, and quick-acting means for simultaneously separating all the contacts with a quick break.

26. A multiphase electric switch comprising a plurality of pairs of separable contacts, an independent inclosure for each pair, insulating liquid in each inclosure, and insulating-partitions for separating the inclosures of the different phases.

27. A multiphase electric switch comprising a plurality of pairs of separable contacts, an independent inclosure for each pair, insulating liquid in each inclosure, and insulating-walls for completely inclosing the inclosure of each phase.

28. A high-potential switch comprising an insulating-support, polyphase terminals mounted in a plurality of separate insulated closed cells, one for each phase, an operating-motor, and a control-circuit governing the motor leading a distance from the switch.

29. A high-potential switch comprising multipolar break-points housed in oil-baths in separate insulated closed cells, an operating connection on the outside, a motor connected therewith, and a control-circuit governed from a distant point for operating the motor.

30. A switch or circuit-breaker for high-potential currents, comprising separable contacts, a highly-insulated inclosure around the rupture-points of said contacts, a motive device for moving said contacts, and means operated at a distance for controlling said motive device.

31. A switch or circuit-breaker for high-potential currents, comprising a plurality of sets of separable contacts, a highly-insulated inclosure around the rupture-points of each of said sets of contacts, a motive device for moving said contacts, and an independent control-circuit for controlling said motive device.

32. A switch or circuit-breaker for high-potential currents, comprising a highly-insulated oil-receptacle for the separable contacts in which the circuit is made and broken under oil, a motive device for establishing and breaking the contact, and an independent low-voltage control-circuit operated at a distance from the switch for controlling the motor to close or open the contacts.

33. A switch or circuit-breaker for high-potential currents, comprising separable contacts, a highly-insulated oil-receptacle therefor, electrically-operated means for closing or separating the contacts, and a control-circuit including a circuit-controller at a distance from the switch for effecting the closure and separation.

34. A switch or circuit-breaker for high-potential currents comprising multipolar separable contacts, substantially air-tight inclosures for the several contacts, and means controlled from a distant point for separating all poles simultaneously.

35. A switch or circuit-breaker for high-potential currents, comprising a plurality of pairs of separable contacts, an inclosure for each pair of contacts, and remotely-controlled means for separating all poles simultaneously.

36. A switch or circuit-breaker for high-potential currents, comprising separable contacts, an inclosure therefor, a body of insulating liquid submerging the contacts, means for giving a long range of motion to the contacts, a motor device for establishing and separating the contacts, an independent low-voltage control-circuit for operating the motor device including a hand-operated circuit-controller located at a distance from the switch, a circuit-changing device at or near the switch for automatically cutting in or out of service the motor after it has acted, and connections for setting the control-circuit for the subsequent switch operation.

37. A high-potential switch or circuit-breaker, having a plurality of independent closed chambers containing oil, multiple contacts within the several chambers submerged in oil, a motor geared to the movable contacts, a spring between the motor and the movable contacts to effect quick separation, and a controlling device distant from the switch for operating the motor.

38. A high-potential switch or circuit-breaker comprising contact-terminals, a small closed chamber inclosing said terminals, and insulating refractory walls housing said chamber on all sides.

39. A high-potential switch or circuit-breaker comprising multiple separable terminals, each pair of terminals being independently inclosed in a small chamber housed within an insulating fireproof inclosure on all sides.

40. A high-potential switch or circuit-breaker, having its contacts submerged in oil, an oil-chamber therefor, and a fireproof insulating-cell around the oil-chamber, the walls of the cell and the oil-chamber being separated by an air-space.

41. A contact for a switch or circuit-breaker, comprising a plurality of segmental rings each composed of a plurality of independent separate parts held together by an annular helical spring.

42. An electric switch or circuit-breaker having a plug-contact and an annular contact to embrace the plug, comprising a plurality of yieldingly-expansible rings independently connected with a circuit-terminal.

43. An electric switch or circuit-breaker having a plug-contact and an annular contact to receive the plug composed of laterally-sliding elastically-yielding independent segments.

44. A contact for a switch comprising a segmental ring composed of a plurality of independent laterally-sliding segments and means for forcing said segments together.

45. An electric switch or circuit-breaker, comprising a fixed terminal, a socket therein, a cup-contact loosely seated in the socket, a movable terminal, and means for guiding them in alinement.

46. An electric switch or circuit-breaker, comprising a fixed terminal, a socket therein, a loosely-fitting cup-contact in the socket, means for locking the cup removably in the socket, and a movable terminal adapted to enter the cup.

812,881. HANGER OR BAR FOR OVERHEAD ELECTRIC TROLLEY-WIRES. ABRAHAM RICHARDSON, Blackpool, England, assignor of seven-eighths to Joseph Heap, Henry Heap, James Bailey, Thomas Brierley, Robert Billington, James Haydock, and Thomas Smith Jones, Blackpool, England. Filed Feb. 6, 1905. Serial No. 244,375.

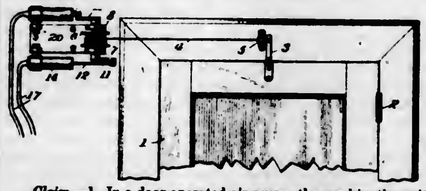
Claim.—1. An ear or hanger for supporting or holding up electric conductor-wires constructed with two jaws to grip the wires upwardly-extending tapered shanks to said jaws an internally-screwed socket between the said shanks to receive the end of the insulator-bolt, a taper-collar provided with an inwardly-projecting annular flange placed over the shanks of the jaws, the insulator-bolt inserted in the socket and a shoulder thereon to engage the flange on the collar and force it over the tapered shank, substantially as described.

2. In an ear or hanger for supporting electric conductor-wires, the combination with two jaws of upwardly-extending divided shanks, such shanks being tapered and furnished with an internally-screw-threaded socket one part in each shank to receive the screwed end of the insulator-bolt a collar with inwardly-projecting annular flange placed over the tapered shanks of the jaws an insulating and supporting screw inserted in the socket and a shoulder on the said insulator-bolt to engage the annular flange and force the collar over the shank substantially as described.

812,882. ANIMAL-GUARD. ST. ELMO ROBINSON, Arlington, Oreg. Filed Aug. 25, 1904. Serial No. 222,173.

Claim.—In a device of the character described, the combination with a spring-handle, of blades having extensions which lie in said handle, slotted adjusting-wedges lying between the handle and said extensions of the blades, and fastening devices passing through said extensions and the handle and through the slotted portions of the wedges.

812,883. DOOR-OPERATED AIR-PUMP FOR ATOMIZERS. WILLIAM H. ROSS, Baltimore, Md. Filed Oct. 30, 1905. Serial No. 285,080.



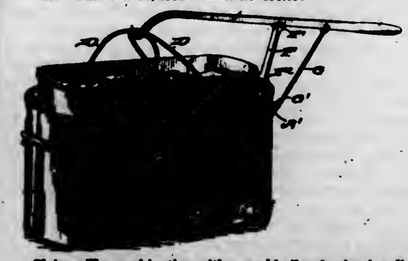
Claim.—1. In a door-operated air-pump, the combination with a door, of a spring-drum, a pump connected with said drum and operated thereby, a cord upon the drum, and means for connecting the cord to the door.

2. In a door-operated air-pump, the combination with a door and means for connecting a cord thereto in any desired relation to the hinge of the door, of a base-plate, a crank-shaft mounted in bearings on said plate, a pump operated from said crank-shaft, a spring-drum connected with said shaft, and a cord connecting said drum with said door.

3. In a door-operated air-pump, the combination with a bracket on the door and a pulley on the door-frame, of a spring-drum, a cord extending from said drum around said pulley to the bracket, and an air-pump operated by said drum.

4. In a door-operated air-pump, the combination with a door and means for connecting the cord thereto, of a base-plate, a plurality of pump-cylinders pivotally connected to said plate, a crank-shaft mounted on said plate and having cranks for operating the pumps, a spring-drum connected with said crank-shaft, and a cord connecting said drum with the door.

812,884. CLOTHES-DRAINER. FRANKLIN P. SAGER, Maplewood, Ohio. Filed Jan. 27, 1904. Serial No. 190,797.



Claim.—The combination with a washboiler, having handles at its ends, of a perforated receptacle within the boiler, provided with

bails, a lever having a hook at one end for engaging the bails of the receptacle, a fulcrum-bar pivoted to the lever intermediate of its ends, said bar having a fork end formed of three members for engaging the upper edge of the boiler, and a rod pivoted to the lever at one side of the fulcrum-bar, and having a hook at its end adapted to one of the handles of the boiler, substantially as shown and described.

812,885. CHECK-VALVE. MOSES L. SANBORN, Boston, Mass. Filed Feb. 10, 1905. Serial No. 245,006.

Claim.—1. A check-valve for dispensing apparatus comprising a coupling consisting of an upright stem having a passage enlarged at its upper part, a horizontal stem at the lower end of the upright stem, a horizontal stem connected at the upper part of the upright stem at right angles to both stems, a passage extending diagonally downward from the enlarged passage in the upright stem into the upper horizontal stem, a supplemental pipe connected with the lower horizontal stem, a delivery-pipe connected with the upper horizontal stem, a stem-plug screwed into the upright stem having a passage through it so that pressure from the supplemental pipe to the delivery-pipe must first pass through the stem-plug and a spring-seated lined cap for the top of the stem-plug for normally closing the stem-plug and preventing the flow of liquid into the supplemental pipe, substantially as shown and described.

2. A check-valve for dispensing apparatus comprising an upright stem, a horizontal stem at the lower end of the upright stem, a horizontal stem connected to the upper part of the upright stem at right angles to both stems, a passage extending from the lower horizontal stem through the upright stem and enlarged at its upper part, a stem-plug inserted in the passage and having a passage extending through it, the upper portion of the passage being of less diameter than the lower portion, so that any substance passing from the lower horizontal stem to the other horizontal stem must first pass through the plug, a spring-operated cap for normally closing the plug, and a passage extending from the passage in the upright stem and at a point lower than the cap, diagonally downward into the other horizontal stem, substantially as shown and described.

812,886. VARIABLE-SPEED GEARING. WILLARD T. SEARS, Philadelphia, Pa., assignor to Niles-Bement-Pond Company, Jersey City, N. J. Filed Apr. 24, 1905. Serial No. 257,149.

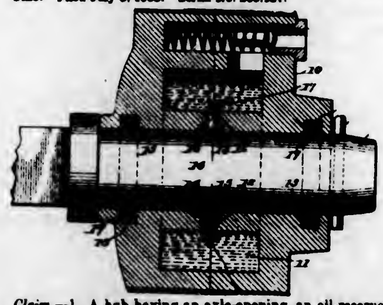
Claim.—1. In variable-speed gearing, the combination of three driven gears turning together, a cage mounted for rotation upon an axis coinciding with that of said gears, planet-shafts carried by said cage parallel with the axis of said gears, planet-gears on said shafts one engaging each of the first-mentioned gears, internal gears one engaging each of said planet-gears, means for holding said internal gears alternately against rotation, a second set of three driven gears turning with said cage, a second cage provided with planet-shafts and planet-gears coöperating with the second set of driven gears, internal gears coöperating with the gears of the second cage, and means for holding the last-mentioned internal gears alternatively against rotation, whereby a number of different speeds in excess of the number of gear ratios provided may be imparted the final driven member of the gearing.

2. In variable-speed gearing, the combination of a driving member, a driven member, and a plurality of sets of planetary gears arranged in a plurality of groups intermediate said members; whereby a number of different relative speeds of said members in excess of the number of said sets of planetary gears may be obtained.

3. The combination of a primary driving-shaft, a primary driven member, and a plurality of sets of planetary gears for imparting to said primary driven member a corresponding number of speeds relative to that of said primary driving member; a final driven member, and a plurality of sets of planetary gears intermediate said driven members, the whole serving to impart to said final driven member a number of speeds relative to that of the primary driving member in excess of the total number of said sets of planetary gears.

4. The combination of a driving member, a primary driven member, three sets of planetary gears intermediate said members, a final driven member, three sets of planetary gears intermediate said driven members, and means for bringing said sets of gears into action selectively, as desired, whereby a number of speeds in excess of the number of said sets of gears may be imparted to said final driven member.

812,887. LUBRICATING-WHEEL. OTIS O. SELLERS, Wellston, Ohio. Filed July 3, 1905. Serial No. 268,127.



Claim.—1. A hub having an axle-opening, an oil-reservoir adjacent to and communicating with the axle-opening by a dovetailed aperture, a closure for the aperture conforming to the interior of and proportioned to be inserted through the axle-opening, and a fibrous material filling the aperture between the closure and reservoir.

2. A hub having an axle-opening, an oil-reservoir adjacent to and communicating with the axle-opening, by a dovetailed aperture with its larger end opening into the axle-opening, a correspondingly-shaped casing adapted to engage the aperture and having a perforate end closing the opening and curved to form a continuation of the adjacent curved walls of the axle-opening, and a fibrous material filling the casing between the perforate closure and the reservoir.

3. A hub having an axle-opening, an oil-reservoir surrounding the axle-opening and substantially concentric therewith and with a tapered aperture connecting the axle-opening and reservoir with its larger end opening into the axle-opening, a casing proportioned to be inserted through the axle-opening into and to fit the aperture and having a perforate end closing the aperture and coinciding substantially with the interior curvature of the axle-opening, a wick engaged within the casing and having one end in contact with the perforate closure and the other end extending into the reservoir, a charging-chamber provided with a charging-opening and communicating with the reservoir, and a valve for the opening.

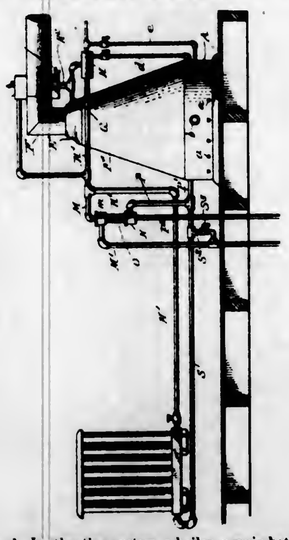
812,888. SPEED-CHANGING MECHANISM. PETER SHANNON, Chicago, Ill. Filed July 5, 1904. Serial No. 215,502.

Claim.—1. In a speed-changing mechanism, the combination of a driving-shaft, a driven shaft in parallel relation thereto, gear-wheels carried by said shafts, a carrying-head capable of circular adjustment with relation to the axis of the driving-shaft, and a series of trains of variable-speed gears carried by said head and comprising a series of outer gear-wheels having variable diameters, intermediate idler-gear wheels operatively connecting said outer gear-wheels with the gear-wheel of the driving-shaft, and a series of outer gears of uniform diameter moving in unison with the series of outer variable gears aforesaid, and adapted to be successively brought into operative engagement with the gear-wheel of the driven shaft, substantially as set forth.

2. In a speed-changing mechanism, the combination of a driving-shaft, a driven shaft in parallel relation thereto, gear-wheels carried by said shafts, a carrying-head capable of circular adjustment with relation to the axis of the driving-shaft, and a series of trains of variable-speed gears carried by said head and comprising a series of outer gear-wheels having variable diameters and arranged in alternated relation to each other, a series of idler-gear wheels each of which operatively connect a pair of said outer gear-wheels with the gear-wheel of the driving-shaft, and a series of outer gears of uniform diameter moving in unison with the series of outer variable gears aforesaid and adapted to be successively brought into operative engagement with the gear-wheel of the driven shaft, substantially as set forth.

3. In a speed-changing mechanism, the combination of a driving-shaft, a driven shaft in parallel relation thereto, gear-wheels carried by said shafts, a carrying-head capable of circular adjustment with relation to the axis of the driving-shaft, and a series of trains of variable-speed gears carried by said head and comprising a series of outer gear-wheels having variable diameters and arranged in alternated relation to each other, a series of idler-gear wheels each of which operatively connect a pair of said outer gear-wheels with the gear-wheel of the driving-shaft and a series of outer gear-wheels of uniform diameter and arranged in alternated relation, said series of gears having movement in unison with the series of outer variable gears aforesaid and adapted to be successively brought into operative engagement with the gear-wheel of the driven shaft, substantially as set forth.

812,889. HOT-WATER HEATING SYSTEM. WILLIAM J. SHERTZ, Washington, D. C., assignor of one-half to Henry M. Baker, Washington, D. C. Filed Mar. 15, 1904. Serial No. 198,314.

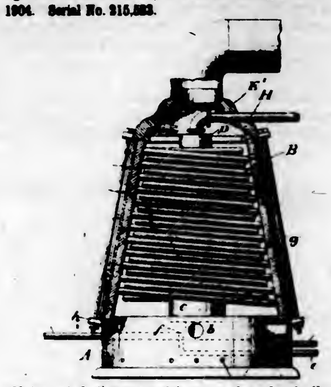


Claim.—1. In a heating system, a boiler, a main hot-water pipe and a return-pipe connected with said boiler, a feed-pipe, a waste-pipe, and a steam-operated safety device connecting the main hot-water pipe and the waste-pipe and controlling the supply of cold water to the boiler during its operation.

2. In a heating system a boiler, a feed-pipe, a main hot-water pipe leading to the radiator, a waste-pipe, and a safety device arranged between the feed and waste pipes and connected to the hot-water pipe, said device comprising two valves adapted to be operated in unison to control the flow of water to the feed-pipe and the flow from the waste or discharge pipe.

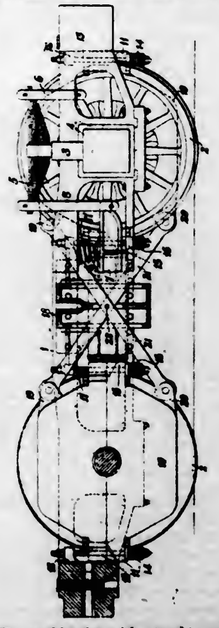
3. In a heating system, a boiler, an expansion-chamber connected therewith, a main hot-water pipe leading to the radiator, a return-pipe from the radiator to the boiler, a waste-pipe from said hot-water pipe, a feed-pipe, a burner connected with the gas-supply, thermostat arranged in the hot-water pipe and controlling the flow of gas to the burner, a safety device arranged between the hot-water pipe and the feed-pipe and controlling the inlet of water to the boiler and the outflow from the hot-water pipe, and a pilot-burner connected to the gas-supply.

812,890. BOILER. WILLIAM J. SHERTZ, Washington, D. C., assignor of one-half to Henry M. Baker, Washington, D. C. Filed July 6, 1904. Serial No. 215,553.



Claim.—A boiler comprising a series of spirally-coiled tubes forming truncated cones, said coiled tubes being arranged one within the folds or convolutions of the other so that they break joint with each other, a manifold or drum arranged within and filling the space of the top coil of the inner coiled tube, a manifold or drum within the lower or bottom coil, each of said series of tubes being connected to said manifolds, and an escape-pipe entering the top manifold or drum.

812,891. INTERCONNECTED SUSPENSION MEANS FOR GEARLESS MOTORS. ROBERT SIEGFRIED, Pittsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed June 13, 1905. Serial No. 264,913.



Claim.—1. The combination with a truck, a pair of electric motors and supporting connections between the same and the truck, of balancing-links the opposite ends of which are connected respec-

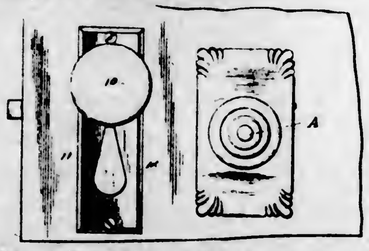
tively to the upper and lower parts of said motors and the middle points of which are connected together.

2. The combination with a truck, a pair of electric motors and supporting connections between the motors and the trucks, of a pair of balancing-links each of which connects the upper side of the one motor with the lower side of the other.

3. The combination with a truck, a pair of electric motors and supporting connections between the motors and the trucks, of a pair of links the ends of which are pivotally attached to opposite sides of opposite motors and the middle points of which are connected together.

4. The combination with a truck, a pair of electric motors and supporting connections between the motors and the trucks, of a pair of links the ends of which are pivotally attached to opposite sides of opposite motors.

812,892. **BURGLAR-ALARM.** JACOB H. SNOW, Indianapolis, Ind. Filed July 28, 1905. Serial No. 271,697.



Claim.—1. The combination with the frame of a bell, a bell-hammer shank, and a spring-actuated slide-rod having an enlargement thereon resting normally in the path of said shank, an arm secured to the rod, the frame of the bell having a recess therein for the reception of the arm, of a door-knob, and means secured to the knob and arm for operating the alarm.

2. The combination with the frame of a bell, a bell-hammer shank, and a spring-actuated slide-rod having an enlargement thereon in the path of the shank, an arm secured to the shank, the frame of the bell having a recess therein for the reception of the arm, of a door-knob, and means connecting the knob and arm together, whereby the arm is caused to ride up the sides of the recess by the turning of the knob and sound the alarm.

3. The combination of a bell-hammer shank, a spring-actuated slide-rod for controlling the latter an arm on the rod having a V-shaped enlargement on one face thereof, the arm of the bell having a V-shaped recess or socket in which the enlargement normally rests, a push-button in position to actuate the rod, a door-knob, and means extending from the knob to the arm.

4. The combination with a door bell, knob and lock having the usual keyhole, of an outer knob-shank, a keyhole-plate rigidly secured to the outer knob-shank, and normally closing the keyhole, an inner knob-shank and means extending from the inner knob-shank to the bell whereby to cause the sounding of the latter with the turning of the knob or the moving the keyhole-plate.

5. The combination of a bell-hammer shank, and a spring-actuated slide-rod for controlling the latter, said rod having an enlargement thereon, which normally rests in the path of the vibratory shaft of the hammer-shank whereby to prevent the latter from striking the bell when it is in its normal position, an arm secured to the rod, a push-button for forcing the rod endwise to release the bell-hammer, means for normally holding the arm in position, a rod extending from the knob to the arm whereby the arm is rocked with the turning of the knob, to move the rod endwise and release the bell-hammer.

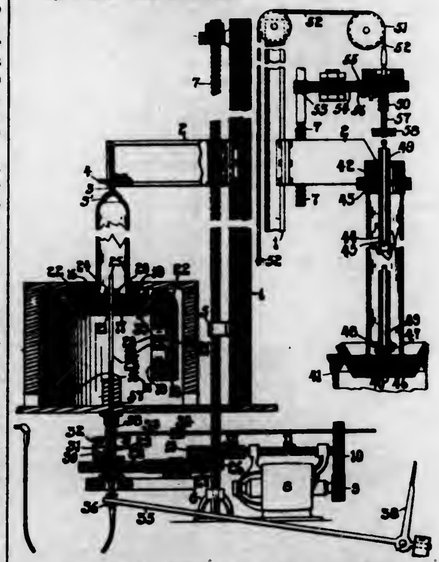
812,893. **WHEEL-TIRE.** EUGENE F. SCHMIZ, Bethlehem, Pa. Filed Sept. 10, 1903. Serial No. 172,173.

Claim.—1. The combination with a vehicle-wheel of two or more annular members movably disposed relative to the felly portion of the same and with the opposite edges overhanging, annular clamp-plates bearing against the sides of the wheel and with their inner faces overhanging, means for securing said clamp-plates to the wheel, and elastic tire members encircling the wheel between said annular members and said clamp-plates and with the side faces projecting beneath the overhanging portions of the clamp-plates and annular members.

2. The combination with a vehicle-wheel of a band encircling the felly portion of the same, means for detachably securing said band to the felly, two or more annular members movably bearing upon said band and with the sides overhanging laterally, annular clamp-plates bearing upon the edges of said band and with their inner faces overhanging the band, means for securing said clamp-plates to the band, and elastic tire members bearing upon the band between said annular members and the clamp-plates and formed with the side faces projecting beneath the overhanging portions of said annular members and clamp-plates.

3. The combination with a vehicle-wheel of a band encircling the felly and with an annular rib integral therewith and with side faces overhanging the band, annular clamp-plates bearing against the sides of the wheel and with their inner faces overhanging the band and elastic tire members encircling the wheel between said annular rib and annular clamp-plates and bearing upon said band and with the side faces of the tire members projecting beneath the overhanging portions of the clamp-plates and ribs.

812,894. **MANUFACTURE OF GLASS.** JAMES R. SPEER, Pittsburg, and GEORGE H. HARVEY, Glenfield, Pa., assignors to Brownsville Glass Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Apr. 1, 1905. Serial No. 253,253.



Claim.—1. In the manufacture of hollow glassware, means independent of the molten glass for cooling the glass in the neighborhood of the drawing zone, and means for lowering the cooling means in unison with the lowering of the molten glass in the receptacle therefor during the drawing operation.

2. In the manufacture of hollow glassware, means for delivering a gaseous fluid within the hollow ware in the neighborhood of the drawing zone and means for lowering the delivering means during the drawing operation.

3. In the manufacture of hollow glass, means within the hollow glass for cooling the glass in the neighborhood of the drawing zone, and means for producing a relative movement of the glass-container and the cooling means during the drawing operation.

4. In the manufacture of hollow glass articles, means for supplying a gaseous pressure within the article during the drawing operation and means for simultaneously lowering the said supplying means.

5. In the manufacture of hollow glass articles, means for drawing the glass, means for supplying a gaseous pressure within the article during the drawing operation, means for lowering the said supplying means at a desired rate relative to the rate of travel of the drawing means.

6. In the manufacture of glass, a swinging pot, having an opening and means for admitting a fluid through said opening but out of contact with the molten glass and means for swinging the pot so that its mouth will be sufficiently low to drain the same.

7. In the manufacture of glass, a swinging pot having an opening, means for admitting a fluid through said opening and means for removing said first means.

8. In the manufacture of hollow glass articles a pipe to conduct fluid to the interior thereof, means for lowering the pipe, said means including a detachable connection, and means for withdrawing the detachable connection.

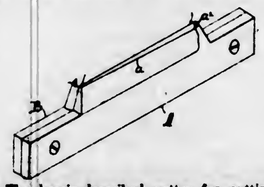
9. In the manufacture of hollow glass articles, a pipe to conduct fluid to the interior thereof, means for lowering the pipe, said means including a detachable connection, means for withdrawing the detachable connection and a second means for lowering the said pipe.

10. Steps in the process of drawing hollow glassware, which consist in drawing vertically a hollow body directly from the molten glass, causing the level of the glass to change as the drawing progresses and supplying a cooling medium within the hollow ware at a substantially fixed distance from the drawing zone.

11. Steps in the process of drawing hollow glass which consist in drawing vertically a hollow body directly from the molten glass, causing a gaseous fluid to be delivered within and against the same at a substantially fixed distance from the drawing zone.

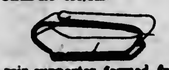
12. Steps in the process of drawing hollow glass articles which consist in drawing vertically a hollow body directly from the molten glass, supplying a gas in the neighborhood of the drawing zone, within the hollow glass and simultaneously lowering the supplying means.

812,895. **CUTTER FOR CUTTING TOOTHPICKS FROM VENEER STRIPS.** GEORGE P. STANLEY, Dixfield, Me., assignor to Cesar H. Harvey, trustee, Portland, Me. Filed Jan. 15, 1906. Serial No. 296,071.



Claim.—The herein-described cutter for cutting toothpicks from veneer strips consisting of a main knife and an auxiliary knife secured together each having a straight cutting edge the two edges being separated by a slightly-tapering recess for forming the toothpicks, said main knife having a curved lateral wing its one end forming the wide rounded end of said recess and at the other end a short lateral wing forming the narrow end of said recess, the said auxiliary knife having like lateral wings projecting away from said recess and located on opposite ends from the wing on the main knife all of said wings being formed integral with their respective knives.

812,896. **REIN-SUPPORTER.** ALVARO B. STOCKBRIDGE, Washington Court-House, and THOMAS B. LAWHEAD, Greenfield, Ohio. Filed July 13, 1904. Serial No. 216,443.

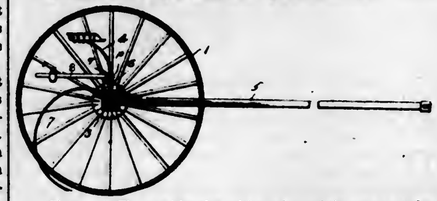


Claim.—1. A rein-supporter formed from a single piece of metal having an enlarged intermediate portion and elongated tapering fingers, the intermediate portion being bent upon itself and the fingers being bent back upon the intermediate portion and in engagement with each other.

2. A rein-supporter formed from a single piece of metal and comprising an enlarged intermediate portion and elongated tapering fingers secured to opposite edges of the intermediate portion, the said intermediate portion having one edge provided with barbs, the barbed edge of the intermediate portion being bent at an angle to the latter and in engagement with the opposite edge of the intermediate portion, the bent portions of the intermediate portion being spaced apart, whereby it may be secured to harness, the said fingers being bent back into engagement with each other above the bent intermediate portion for the support of a rein.

3. A rein-supporter comprising an intermediate portion, and oppositely-disposed fingers, the intermediate portion being bent back upon itself and provided with barbs whereby it may be secured to harness, the said fingers being bent into engagement with each other above the bent intermediate portion to form a guide.

812,897. **HAY-RAKE ATTACHMENT.** JESSE H. SUTHERLAND Dawkins, Colo. Filed Dec. 12, 1904. Serial No. 236,690.



Claim.—1. The combination with a rake and the seat-post thereof, of a member connected to said post, and adjustable means connected to said member for obstructing the lift of the rake.

2. The combination with a rake and supporting-frame therefor, of a bar connected adjustably to said frame, and adjustable means connected with said bar for limiting the lift of the rake.

3. The combination with a rake and its supporting-frame, of a bar connected to said frame located above the rake, and means thereon for limiting the lift of the rake.

4. The combination with a rake and its supporting-frame, of a bar adjustably connected to said frame located above the rake, and said bar provided with means for limiting the lift of the rake.

5. The combination with a rake having a suitable supporting-frame of a bar adjustably connected to said frame and located above said rake, having adjustable means for limiting the lift of said rake.

6. The combination with a rake and supporting-frame, of a bar clamped to said frame, and a cross-bar secured on the first bar and located in the path of the lift of the rake.

7. In a rake, the combination with the seat-post, of a bar having means for attachment thereto, a cross-bar fastened to said first-mentioned bar and located in the path of the lift of the rake.

8. The combination with a rake, of a seat-post, a slotted bar having means for attachment thereto, and a cross-bar adjustably connected to said slotted bar and located in the path of the lift of the rake.

9. In a rake, the combination with the seat-post thereof, of a slotted bar having means for attachment to said post, a bar arranged at right angles to said slotted bar and located in the path of the lift of the rake, and a bolt and nut for clamping said bars together.

812,898. **FEED MECHANISM.** JOHN J. TEAGHER, Attleboro, Mass., assignor to Brown and Sharpe Manufacturing Company, Providence, R. I., a Corporation of Rhode Island. Filed Feb. 13, 1906. Serial No. 300,467.

Claim.—1. The combination of a power feed mechanism, a part operated thereby, and mechanism for manually accelerating the movement of the part during the operation of the power-feed.

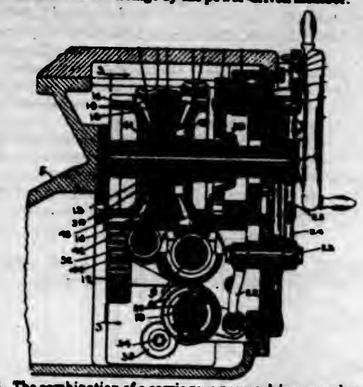
2. The combination of a power feed mechanism, a part operated thereby, and mechanism for manually accelerating or retarding the movement of the part during the operation of the power-feed.

3. The combination of a power-feed, a carriage operated thereby, mechanism for manually accelerating the movement of the carriage during the operation of the power-feed.

4. The combination of a work-support, a grinding-wheel support, power mechanism for feeding one of said supports, and mechanism for manually varying the feed during the operation of the power feeding mechanism.

5. The combination of a carriage, a power-driven member, gearing through which motion is transmitted to said carriage, and mech-

anism for manually operating said gearing while in operation to vary the movement of said carriage by the power-driven member.



6. The combination of a carriage, a power-driven member, gearing through which motion is transmitted to said carriage, and mechanism for manually moving said gearing about the axis of the driving member to vary the movement of the carriage by the driving member

7. The combination of a carriage, of a driven member connected with the carriage, a driving member, intermediate gearing, power mechanism for operating the driving member, and mechanism for manually turning the intermediate gearing about the axis of the driving and driven members.

8. The combination with a carriage of a power-driven feed mechanism therefor, and a manual feed therefor unaffected by the power-feed when operatively connected with the carriage.

9. The combination with a carriage of a power-driven feed mechanism therefor, intermediate gearing in said mechanism, means for holding said intermediate gearing in position during the operation of the feed mechanism, and mechanism for manually shifting said gearing to effect the manual feed of the carriage.

10. The combination with a driven gear and a part operated therefrom, of a driving-gear, power mechanism for operating said driving-gear, intermediate gearing between said driving and driven gears, a frame carrying said intermediate gearing, and mechanism for manually operating said frame.

11. The combination with a driven gear and a part operated therefrom, of a driving-gear, power mechanism for operating said driving-gear, intermediate gearing between said driving and driven gears, a frame carrying said intermediate gearing, means for locking said frame in position and means for manually operating said frame.

12. The combination with a driven gear and a part operated therefrom, of a driving-gear, a worm-wheel connected with said driving-gear, a worm engaging said worm-wheel, a power mechanism for operating said worm, intermediate gearing between the driving and driven gears, a frame carrying said intermediate gearing, a worm-wheel connected with the frame, a worm engaging the worm-wheel, and mechanism for manually operating said worm.

13. The combination of a work-support, a tool-support, a driven gear connected to feed one of said supports, a driving-gear, power mechanism for operating said driving-gear, intermediate gearing between the driving and driven gears, means for holding said intermediate gearing in position, and means for manually shifting said intermediate gearing to impart movement to the connected support.

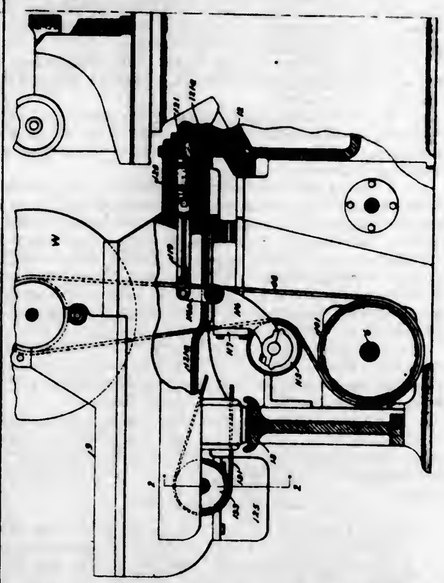
14. The combination of a work-support, a tool-support, a driven gear connected to feed one of said supports, a driving-gear, power mechanism for operating said driving-gear, mechanism for reversing said power mechanism, intermediate gearing between said driving and driven gears, and mechanism for manually shifting said gearing to impart movement to the connected support.

15. The combination of a work-support, a tool-support, a power-driven feed mechanism connected with one of said supports, a hand-operated device, and gearing between said device and the movable support for transmitting motion from the device to said support and preventing movement of said device by the power-driven mechanism.

16. The combination of a work-support, a tool-support, a reversing mechanism, gearing intermediate said reversing mechanism and one of said supports for feeding it in either direction, and manually-operated mechanism for effecting a relative movement between parts of said gearing to transmit motion to the connected support.

17. The combination of a work-support, a grinding-wheel support, a reversing-mechanism gearing intermediate said mechanism and one of said supports for feeding it in either direction, a hand device, and connections between said device and said gearing for shifting a part of said gearing to transmit motion from said device to the connected support.

812,899. BELT-TIGHTENER. JOHN J. TRACHER, Attleboro, Mass., assignor to Brown and Sharpe Manufacturing Company, Providence, R. I., a Corporation of Rhode Island. Filed July 3, 1905. Serial No. 268,620.



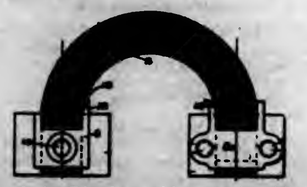
Claim.—1. A belt-tightening mechanism comprising a belt, a belt-engaging device, a piston connected with said device, devices for maintaining a fluid-pressure on said piston, and driving mechanism for the belt and connection for driving the pressure-maintaining devices from said driving mechanism, substantially as described.

2. A belt-tightening mechanism comprising a belt, a belt-engaging device, a piston connected with said device, and devices for maintaining a fluid-pressure on said piston driven from the driving mechanism for the belt.

3. A belt-tightening mechanism comprising a belt-engaging device, and means for forcing the device against the belt by fluid under pressure, which are rendered inoperative upon the stopping of the belt.

4. A belt-tightening mechanism comprising a belt-engaging device, a piston connected with the device, and a pump for maintaining fluid-pressure on the piston and a common driving mechanism for the pump and belt.

812,900. RAIL-BOND. EDWARD G. TRUMAN, Cambridge, Mass. Filed Dec. 24, 1902. Serial No. 136,402.



Claim.—1. A rail-bond comprising a number of flexible strips provided with an attaching-surface intersecting the intended path of the electric current conveyed by the bond and formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely-extending recess opposite said attaching-surface, in combination with a binding-plate located in said recess.

2. A rail-bond comprising a number of flexible strips, and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, and extending beyond the edges of said collective surfaces in the same plane therewith, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a binding-plate located in said recess.

3. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, in combination with a U-shaped binding-plate having its middle portion placed against said strips opposite said attaching-surface and having its ends arranged to confine said strips against lateral separation.

4. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond and also having a transversely-extending recess opposite said attaching-surface, in combination with a U-shaped binding-plate embracing said strips and having its central portion located in said recess.

5. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a U-shaped binding-plate embracing said strips and having its central portion located in said recess.

6. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely-extending recess opposite said attaching-surface, in combination with a U-shaped perforated binding-plate having its central portion located in said recess.

7. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a U-shaped perforated binding-plate having its central portion located in said recess.

8. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and having a transversely-extending recess opposite said attaching-surface, said attaching-surface intersecting the intended path of the electric current conveyed by said bond, in combination with a binding-plate located in said recess, and means for preventing the lateral separation of said strips.

9. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, and extending beyond the edges of said collective surfaces in the same plane therewith, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a binding-plate located in said recess, and means for preventing the lateral separation of said flexible strips.

10. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely-extending recess opposite said attaching-surface, said attaching-surface intersecting the intended path of the electric current conveyed by said bond, the bottom of said recess forming an acute angle with said attaching-surface, in combination with a binding-plate located in said recess.

11. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, and extending beyond the edges of said collective surfaces in the same plane therewith, said bond being provided with a transversely-extending recess located opposite said attaching-strip and having its bottom forming an acute angle with said attaching-strip, in combination with a binding-plate located in said recess.

12. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely-extending recess opposite said attaching-surface, the bottom of said recess making an acute angle with said attaching-surface, in combination with a U-shaped binding-plate having its central portion located in said recess.

13. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, said bond being also provided with a transversely-extending recess, the bottom of which forms an acute angle with said attaching-strip, in combination with a U-shaped binding-plate having its central portion located in said recess.

14. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, in combination with a U-shaped binding-plate embracing said strips opposite said attaching-surface, the ends of said binding-plate being formed to extend laterally beyond the central portion thereof, in a direction parallel with the length of the strips, for the purpose set forth.

15. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said strips on one side of the bond, in combination with a U-shaped binding-plate embracing said flexible strips opposite said attaching-strip, the ends of the binding-plate being extended laterally beyond the central portion thereof, in a direction parallel with the length of the strips, for the purpose set forth.

16. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely extending recess opposite said attaching-surface, said attaching-surface intersecting the intended path of the electric current conveyed by said bond, in combination with a binding-plate having its central portion located in said recess and having its ends extended beyond said central portion, toward the flexible portion of the bond.

17. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, and extending beyond the edges of said collective surfaces in the same plane therewith, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a binding-plate having its central portion located in the said recess and having its ends extended beyond said central portion, toward the flexible portion of the bond.

18. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, in combination with a U-shaped binding-plate embracing said strips opposite said attaching-surface and having an extended end provided with a rounded inner surface adjacent to the flexible portion of the bond, for the purpose set forth.

19. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, in combination with a U-shaped binding-plate embracing said strips opposite said attaching-surface and having an extended end provided with a rounded inner surface adjacent to the flexible portion of the bond, for the purpose set forth.

20. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely-extending recess opposite said attaching-surface, in combination with a binding-plate located in said recess and having an extended end provided with a rounded inner surface adjacent to the flexible portion of the bond and normally out of contact therewith, for the purpose set forth.

21. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a binding-plate located in said recess, and having an extended end provided with a rounded inner surface adjacent to the flexible portion of the bond and normally out of contact therewith, for the purpose set forth.

22. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, in combination with a binding-plate placed against said strips opposite said attaching-surface, said binding-plate being provided with two perforations located adjacent to the edges of the bond, and the direction of said perforations being perpendicular to said collective exposed surfaces of the flexible strips.

23. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, in combination with a U-shaped binding-plate embracing said strips opposite said attaching-surface, said binding-plate being provided with two perforations located adjacent to the edges of the bond, and the direction of said perforations

being perpendicular to said collective exposed surfaces of the flexible strips.

24. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said strips on one side of the bond, in combination with a binding-plate placed against said flexible strips opposite said attaching-strip, and provided with two perforations located adjacent to the edges of the bond, the direction of said perforations being perpendicular to said collective exposed surfaces of the flexible strips.

25. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, in combination with a U-shaped binding-plate embracing said flexible strips opposite said attaching-strips and provided with two perforations located adjacent to the edges of the bond, the direction of said perforations being perpendicular to said collective exposed surfaces of the flexible strips.

26. A rail-bond comprising a number of flexible strips provided with an attaching-surface formed by the collective exposed surfaces of the strips on one side of the bond, and also having a transversely-extending recess opposite said attaching-surface, in combination with a binding-plate having its central portion located in said recess and also having two perforations located adjacent to the edges of the bond.

27. A rail-bond comprising a number of flexible strips and an attaching-strip secured to the collective exposed surfaces of said flexible strips on one side of the bond, said bond being also provided with a transversely-extending recess opposite said attaching-strip, in combination with a binding-plate having its central portion located in said recess and also having two perforations located adjacent to the edges of the bond.

28. A binding-plate for rail-bonds provided with two perforated lugs and also having its end portions extended beyond one edge of its central portion, transversely to the direction of the perforations in said lugs.

29. A U-shaped binding-plate for rail-bonds having its end portions extended laterally beyond one edge of its central portion, and also having two perforated lugs located on opposite sides of said central portion.

30. A rail-bond comprising a number of flexible strips having superimposed flat attaching portions the corresponding edges of which extend laterally beyond the flexible portion of the bond, said extending edges providing collectively an attaching-surface at one side of the bond.

31. A rail-bond comprising a number of flexible strips having superimposed flat attaching portions the corresponding edges of which extend laterally beyond the flexible portion of the bond, said extending edges providing collectively an attaching-surface at one side of the bond, in combination with means for clamping said attaching-surface against a rail.

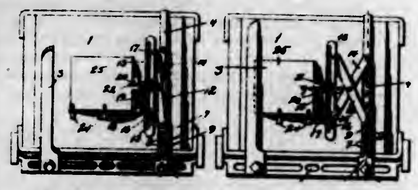
32. A rail-bond comprising a number of flexible strips having superimposed flat attaching portions the corresponding edges of which extend laterally beyond the flexible portion of the bond, said extending edges providing collectively an attaching-surface at one side of the bond, in combination with a binding-plate embracing said strips opposite said attaching-surface.

33. A rail-bond comprising a number of flexible strips having superimposed flat attaching portions the corresponding edges of which extend laterally beyond the flexible portion of the bond, said extending edges providing collectively an attaching-surface at one side of the bond, in combination with a binding-plate applied to said strips opposite said attaching-surface and perforated to receive an attaching bolt or rivet.

34. A rail-bond comprising a number of flexible strips having superimposed flat attaching portions the corresponding edges of which extend laterally beyond the flexible portion of the bond, said extending edges providing collectively an attaching-surface at one side of the bond, in combination with means for confining the attaching portions of said strips in superimposed relation.

812,901. AUTOMATIC SHEET-ADJUSTING DEVICE FOR PRINTING-PRESSES. FRED H. TRESSEL, Columbus, Ohio. Filed May 26, 1905. Serial No. 262,260.

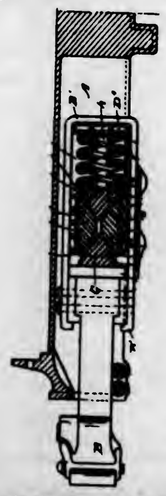
Claim.—1. In an automatic sheet-adjuster, the combination with the platen and gripper-bar, of a printing-press of a bracket secured to the platen, a slide-bar mounted to slide longitudinally on the bracket, means having connection with the slide-bar and the gripper-bar for imparting motion to said slide-bar, an adjusting-bar movable at right angles to the slide-bar, crossed links having connection with the adjusting-bar, the slide-bar and the bracket for moving the adjusting-bar laterally, and a pusher-piece mounted on the adjusting-bar.



2. In an automatic sheet-adjuster, the combination with the platen and gripper-bar, of a printing-press of a bracket secured to the platen, a slide-bar mounted to slide longitudinally on the bracket, means having connection with the slide-bar and the gripper-bar for imparting motion to said slide-bar, an adjusting-bar movable at right angles to the slide-bar, crossed links having connection with the adjusting-bar, the slide-bar and the bracket for moving the adjusting-bar laterally, and a pusher-piece adjustable on the adjusting-bar in directions at substantially right angles to each other.

3. In an automatic sheet-adjuster, the combination with the platen and the gripper-bar of a printing-press, a support arranged on the platen, sheet-adjusting parts, crossed links interposed between the sheet-adjusting parts and the support for laterally and downwardly moving said parts, and means operating on the support having connection with the gripper-bar and the crossed links for imparting motion to the latter.

812,902. FRICTION DRAFT-RIGGING FOR RAILWAY-CARS. FREDERICK B. TOWNSEND, Chicago, Ill., assignor to W. H. Miner Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 28, 1904. Serial No. 230,315.



Claim.—1. In a friction draft-rigging, the combination with a draw-bar and a draw-bar strap or yoke, of a sliding friction shell or casing having a friction-chamber and interior friction-faces parallel with the draw-bar, and a spring-chamber of larger size or diameter than the friction-chamber, sliding friction-blocks within the friction-chamber of said shell or casing having exterior friction-faces parallel to and in sliding frictional engagement with said interior friction-faces of said shell or casing, a wedge or device for spreading said blocks and a spring in the spring-chamber of said shell or casing, said friction shell or chamber having an opening in one of its sides for insertion and removal of the spring, the walls of said friction-chamber being thicker and stronger than the walls of said spring-chamber, substantially as specified.

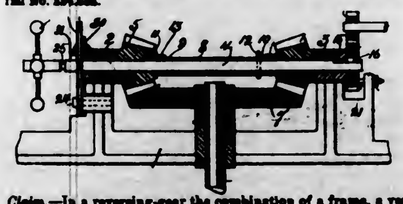
2. In a friction draft-rigging, the combination with a draw-bar and a draw-bar strap or yoke, of a sliding friction shell or casing having a friction-chamber and interior friction-faces parallel with the draw-bar, and a spring-chamber of larger size or diameter than the friction-chamber, sliding friction-blocks within the friction-chamber of said shell or casing having exterior friction-faces parallel to and in sliding frictional engagement with said interior friction-faces of said shell or casing, a wedge or device for spreading said blocks and a spring in the spring-chamber of said shell or casing, said spring being of larger size or diameter than the friction-chamber, said friction shell or casing having an opening in one of its sides for insertion and removal of the spring, the walls of said friction-chamber being thicker and stronger than the walls of said spring-chamber, substantially as specified.

3. In a friction draft-rigging, the combination with a car-frame furnished with front and rear stops, of a draw-bar and draw-bar yoke or extension, a follower abutting against one of said stops on the car-frame, a sliding friction shell or casing abutting at one end against the other stop on the car-frame, and having a friction-chamber, and a spring-chamber of larger size than the friction-chamber, said sliding friction-shell having interior friction-faces parallel to the draw-bar, and said friction-blocks having exterior friction-faces parallel to and in frictional engagement with said interior friction-faces of said friction shell or casing, sliding friction-blocks in said friction-chamber, a wedge for spreading said blocks and a spring, said friction shell or casing having a lateral opening for insertion and removal of the spring, the walls of said friction-chamber being thicker and stronger than the walls of said spring-chamber, substantially as specified.

4. In a friction draft-rigging, the combination with a car-frame furnished with front and rear stops, of a draw-bar and draw-bar yoke or extension, a follower abutting against one of said stops on the car-frame, a sliding friction shell or casing abutting at one end against the other stop on the car-frame, and having a friction-chamber, and a spring-chamber of larger size than the friction-chamber, sliding friction-blocks in said friction-chamber, said sliding friction-shell having interior friction-faces parallel to the draw-bar, and said friction-blocks having exterior friction-faces parallel to and in frictional engagement with said interior friction-faces of said friction shell or casing, a pair of wedges for spreading said blocks and a spring, said sliding friction shell or casing having a lateral opening through one of its sides for insertion and removal of the spring, the walls of said friction-chamber being thicker and stronger than the walls of said spring-chamber, substantially as specified.

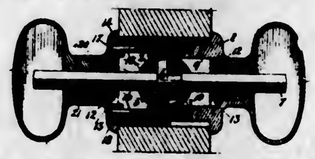
5. In a friction draft-rigging, the combination with a draw-bar and a draw-bar strap or yoke, of a sliding friction shell or casing having a friction-chamber and a spring-chamber and furnished with a lateral opening into the spring-chamber for insertion and removal of the spring, sliding friction-blocks in the friction-chamber, said sliding friction-shell having interior friction-faces parallel to the draw-bar, and said friction-blocks having exterior friction-faces parallel to and in frictional engagement with said interior friction-faces of said friction shell or casing, and a spring in the spring-chamber, the walls of said friction-chamber being thicker and stronger than the walls of said spring-chamber, substantially as specified.

812,903. GEARING. BERNHARD TROPP, New York, N. Y., assignor to William Henry Laird, New York, N. Y. Filed Sept. 17, 1904. Serial No. 224,882.



Claim.—In a reversing-gear the combination of a frame, a vertical and a pair of horizontal bearings extending from the frame, a main shaft located in the vertical bearing, a bevel-gear fastened to the main shaft, a second shaft supported in the horizontal bearings and having a pair of grooves, a pair of bevel-pinions supported on the second shaft, a sleeve on the second shaft separating the bevel-pinions, pins extending from the second shaft, pins extending from the bevel-pinions, the second shaft arranged to slide in its bearings so that one of the pins thereon may be engaged with a pin of the bevel-pinions in one position thereof, and the other pin of the second shaft arranged to be engaged with the pin of the other bevel-pinion after the second shaft has been moved to another position, a lever having a hook extending therefrom fulcrumed on the frame and arranged to engage one of the two grooves on the second shaft, a spring between the hook of the lever and the frame to hold the lever in engagement with one of the grooves on the second shaft, a lug extending from the frame, and means to lock the said lever with said lug.

812,904. LOCK AND LATCH MECHANISM. HENRY G. VOGHT, New Britain, Conn., assignor to The Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Mar. 18, 1905. Serial No. 250,726.



Claim.—1. In a lock and latch mechanism, a lock-case adapted to be inserted in the edge of a door and surrounded by the material thereof on both sides, a bolt, slide and roll-back guided and supported in said case, inner and outer bearing-plates connected to said case, telescopic means of connection for permitting the adjustment of said bearing-plates to and fro for doors of different thicknesses, and yet maintaining their alinement relative to each other and to said operating mechanism, and actuating knobs or members mounted in each of said plates.

2. In a lock and latch mechanism, the combination of a case adapted to be supported in a hole in the edge of a door, a bolt and operating mechanism supported therein, said case having grooves at the top and bottom, bearing-plates for the actuating members, and projecting members carried thereby coöperating with said grooves and with each other for permitting adjustment to and fro and maintaining proper alinement.

3. In a lock and latch mechanism, the combination of a case adapted to be supported in a hole in the edge of a door, a bolt and operating mechanism supported therein, said case having a transverse groove and a passage for the actuating-spindle, bearing-plates, a projection from one of said plates fitting said groove, means of connection between the other plate and said first plate and said case whereby said plates may be adjusted to and fro and held in alinement, and actuating-knobs carried by said plates.

4. In a lock and latch mechanism, a bearing-plate having a longitudinal passage with a shoulder at the inner end, a knob-shank fitting said passage and having an annular recess at its inner end, a plurality of segmental pieces fitting said recess and grooved in their outer surfaces, and a split spring-ring fitting the grooves and holding said pieces in place to prevent the withdrawal of said shank member, substantially as described.

5. In a lock and latch mechanism, the combination of two rose-plates adapted to the opposite sides of the door, operating-knobs having bearings therein, and coöperating telescopic means projecting from said plates with screws for attaching one to the other.

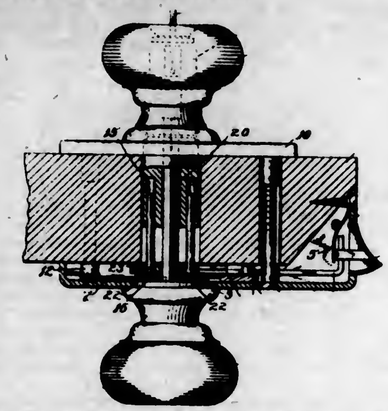
812,905. LOCK AND LATCH MECHANISM. HENRY G. VOGHT, New Britain, Conn., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed June 6, 1905. Serial No. 263,917.

Claim.—1. In a lock and latch mechanism, the combination of a latch-slide, inner and outer knobs, operative means of connection between said knobs and said slide, means for dogging the operative connection between one of said knobs and said latch-slide, and means for permitting the connection to be broken when the knob is forcibly rotated before the dogging connection is dislocated.

2. In a lock and latch mechanism, the combination of a latch-bolt, inner and outer knobs, means of operative connection between said knobs and said latch-bolt, means for dogging the operative connection between one of said knobs and said latch-bolt, a lock carried by said knob, a spindle connection therefrom to the other knob, and means for preventing the retraction of said bolt when the operative connection between said outer knob and said dogging device is broken.

3. In a lock and latch mechanism, the combination of a latch-bolt, inner and outer knobs, independent roll-backs therefor with operative means of connection to said latch-bolt, means for dogging one of said roll-backs, and breakable means of connection between said roll-back and its knob.

4. In a lock and latch mechanism, the combination of a latch-bolt, inner and outer knobs, independent roll-backs therefor with operative means of connection to said latch-bolt, means for dogging one of said roll-backs, breakable means of connection between said roll-back and its knob, and means for stopping the rotation of said outer knob when said connection is broken.



5. In a lock and latch mechanism, the combination of a latch-bolt, inner and outer knobs, operative means of connection between said knobs and said latch-bolt, a lock carried by one of said knobs, means for dogging the operation of said knob, means of connection between said lock and said latch-bolt for retracting said latch-bolt when said knob is dogged, means for permitting the connection between said knob and said latch-bolt to be broken when said dogging device is in operation, and means for preventing the retraction of said bolt by the continued rotation of said knob and lock connection.

6. In a lock and latch mechanism, the combination of a latch-bolt, inner and outer knobs, operative means of connection between said knobs and said latch-bolt, a lock carried by one of said knobs, means for dogging the operation of said knob, means of connection between said lock and said latch-bolt for retracting said latch-bolt when said knob is dogged, means for permitting the connection between said knob and said latch-bolt to be broken when said dogging device is in operation, and means for preventing the retraction of said bolt by the continued rotation of said knob and lock connection comprising a plate having two arms rotatable with said knob, stationary stops for said arms, and a projection normally retractable with said latch-bolt, but prevented from movement by one of said arms.

7. In a lock and latch mechanism, the combination of a latch-slide, inner and outer knobs, roll-backs therefor, a lock carried by one of said knobs having means of connection with the roll-back of the other knob, a plate rotatable with said lock-carrying knob, means of connection between said plate and the roll-back of said knob, means for dogging said roll-back, said knob and plate being rotatable independently of said roll-back by the application of considerable force when said roll-back is dogged.

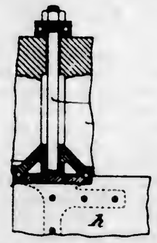
8. In a lock and latch mechanism, the combination of a latch-slide, inner and outer knobs, roll-backs therefor, a lock carried by one of said knobs having means of connection with the roll-back of the other knob, a plate rotatable with said lock-carrying knob, means of connection between said plate and the roll-back of said knob, means for dogging said roll-back, said knob and plate being rotatable independently of said roll-back by the application of considerable force when said roll-back is dogged, and means for preventing the retraction of said slide by the continued rotation of said knob and lock connection.

812,906. **HOLDER FOR SHAVING-STICKS.** ROBERT L. WARREN, Boston Center, Mass. Filed Jan. 31, 1905. Serial No. 243,607.

Claim.—1. A shaving-stick holder consisting of a tubular case having a fixed partition within said case dividing the same into two compartments of different lengths, the shorter compartment being of less diameter than the longer compartment, the longer compartment adapted to receive and firmly hold a cylindrical stick of shaving-soap when inclosed in its paper wrapper, the shorter compartment adapted to receive and firmly hold the stick after the wrapper has been removed, and the fixed partition provided with a central aperture extending through it from side to side, substantially as shown and described.

2. A shaving-stick holder consisting of a hollow cylindrical shell having on its inner side a fixed partition dividing the same into two compartments of unequal length, a rim within the shorter compartment extending from the partition to the outer edge of the case, said shorter compartment adapted to receive and firmly retain a cylindrical piece of slippery shaving-soap which would be freely movable in the longer compartment, and the fixed partition provided with a central circular aperture extending from one compartment to the other, substantially as shown and described.

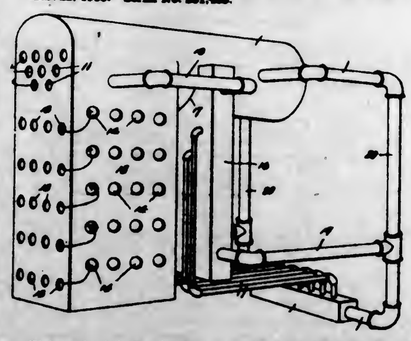
812,907. **DEVICE FOR HANGING REVOLVING-DOOR WINGS.** JULIUS WIESELER, Berlin, Germany. Filed Feb. 15, 1905. Serial No. 245,796.



Claim.—1. A device for hanging revolving-door wings, comprising a vertical flanged pin turning in the roof of the door-chamber and holding the wing, to which it is secured, to the roof, a ball-bearing on which the top of the pin turns on the roof, and a second ball-bearing between the roof and the pin-flange, substantially as described.

2. A device for hanging revolving-door wings, comprising a vertical pin turning in the roof of the door-chamber and holding the wing, to which it is secured, to the roof, a ball-bearing on which the top of the pin turns on the roof, and two superposed ball-bearings for the pin, located in the roof, substantially as described.

812,908. **STEAM-BOILER.** DAVID WISHART, Greenbush, Ill. Filed Mar. 22, 1905. Serial No. 251,482.



Claim.—1. A boiler having an approximately vertical portion provided with a series of sets of flues extending therethrough, each set comprising two rows of flues, one disposed above the other, and at a right angle thereto, all of the flues of one row of each set communicating with the combustion-chamber and arranged for the direct passage of the products of combustion, and flue members or partitions for directing the products of combustion from one row of each set to the second row of each set of flues.

2. The combination with a boiler, of an auxiliary water-heating chamber having a circulating connection with the boiler, said auxiliary chamber forming the rear wall of the fire-box and spaced from the front face of the main boiler to form a vertical passage or combustion-chamber through which the products of combustion must pass to the main boiler-flue.

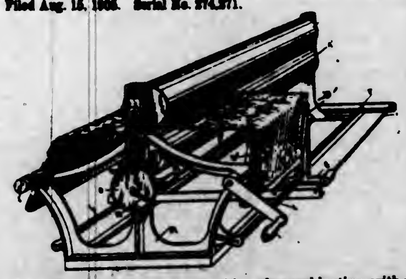
3. The combination with a steam-boiler, of an auxiliary chamber arranged in front of the main boiler and forming the rear wall of the fire-box, a water-box arranged at the front of the boiler and having a circulating connection therewith, and a water-grate formed of tubes connected at their front edge to the water-box, the rear ends of said tubes extending upward within the combustion-space formed between the auxiliary chamber and the main boiler, and their upper ends being connected to said auxiliary chamber.

812,909. **TRACE-CARRIER.** JAMES H. WILSON, Denver, Colo. Filed Aug. 28, 1905. Serial No. 276,142.

Claim.—1. In a harness, the combination with a breeching, and a breeching-strap comprising lower and upper sections and a buckle connecting said sections and having a tongue; of a trace-carrier having an apertured body portion and an arm extending downwardly from the upper wall of the aperture in the body portion and terminating in an inwardly-directed hook, and also having an upper portion disposed obliquely to the body portion, and having an eye receiving the lower portion of the upper section of the breeching-strap, and an open lug extending inwardly from the upper wall of the eye and receiving the tongue of the buckle comprised in the breeching-strap.

2. As an article of manufacture, a trace-carrier comprising an apertured body portion, an arm extending downwardly from the upper wall of the aperture in the body portion and terminating in an inwardly-directed hook, an eye disposed above the apertured body portion, and an open lug extending inwardly at an angle from the upper wall of the eye.

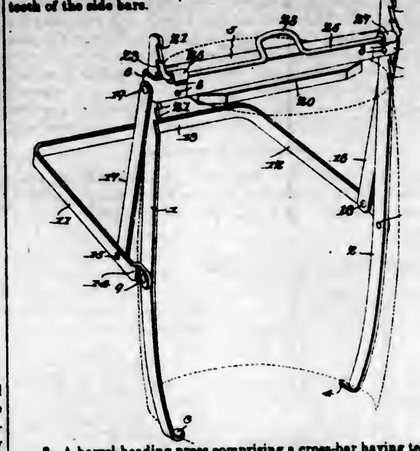
812,910. **INVOICING-MACHINE.** JACOB G. WEBER, Joplin, Mo. Filed Aug. 15, 1905. Serial No. 274,271.



Claim.—In a cloth-measuring machine, the combination, with a fixed frame and two rolls journaled therein one over the other, of two sets of rotatable clamps arranged on opposite sides of said frame for holding belt-bands, the bearing and support of one of the clamps of each set being spring-actuated and adjustable toward and from the other, and the bearing of one of the clamps of each of the sets comprising, in addition to the clamp proper, the rotatable screw-threaded shaft *d* having a friction-head *e* that works in contact with a portion B of said frame, and a nut *c* and spring *g* applied to said shaft and arranged in a socket in the part B, for regulating friction and thereby the tension of the fabric while being unwound, as shown and described.

812,911. **BARREL-HEADING PRESS.** CHESS J. WYMAN, Medina, and CHARLES DUMBERRY and COURTLAND C. TERRILL, Akron, N. Y. Filed July 20, 1905. Serial No. 270,076.

Claim.—1. A barrel-heading press comprising a cross-bar having terminal upright guides, side bars slidable through the guides with their lower ends terminating in hooks and their upper ends provided with teeth, means extending between the cross-bar and the side bars to move the cross-bar upon the side bars, and connected pawls mounted upon the cross-bar for simultaneous engagement with the teeth of the side bars.



2. A barrel-heading press comprising a cross-bar having terminal guides, side bars slidable through the guides with their lower ends terminating in hooks and their upper ends provided with teeth, means for moving the cross-bar and carrying terminal pawls for simultaneous engagement with the teeth of the side bars.

3. A barrel-heading press comprising a cross-bar provided with terminal guides, side bars slidable through the guides with their lower ends terminating in hooks and their upper ends provided with teeth, means to move the cross-bar upon the side bars, and a rock-bar journaled upon the cross-bar, an intermediate portion of the rock-bar being bent into a crank-handle, and the terminals of the bar being bent to form pawls for simultaneous engagement with the teeth of the side bar.

4. A barrel-heading press comprising a cross-bar, substantially U-shaped clips embracing the ends of the bar and projecting beyond the same to form guide-openings, said clips being provided with bearing-eyes alined longitudinally of the cross-bar, side bars slidable through the guide-clips with their lower ends terminating in hooks and their upper ends provided with teeth, means for moving the cross-bar upon the side bars, and a rock-bar journaled in the eyes and provided with pawls engaging the teeth of the side bars.

5. A barrel-heading press comprising a cross-bar having terminal guides, side bars slidable through the guides with their lower ends terminating in hooks and their upper ends provided with teeth, means for moving the cross-bar upon the side bars, and a rock-bar journaled upon the cross-bar and provided with a handle and pawls lying upon the same side of the bar, the pawls being disposed for simultaneous engagement with the teeth of the side bars, and the handle constituting a weight to yieldably maintain the pawls in engagement with the teeth.

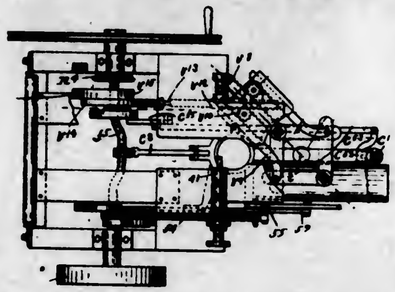
6. A barrel-heading press comprising a cross-bar, substantially U-shaped clips embracing the ends of the cross-bar and projecting beyond the latter to form guide-openings, said clips being provided with alined bearing-eyes at one side of the cross-bar, side bars slidable through the guide-openings with their lower ends terminating in hooks and their upper ends provided with teeth, means for moving the cross-bar upon the side bar, and a rock-bar journaled in the bearing-eyes, the terminals of the bar being bent into pawls for simultaneous engagement with the teeth of the side bars, and an intermediate portion of the rock-bar being bent into a handle lying upon the same side of the rock-bar as the pawls.

7. A barrel-heading press comprising a cross-bar proportioned to bear upon the head of a barrel and provided with clips at its extremities, upright side bars slidably embraced by and extending above the clips and provided with ratchet-teeth at their upper extremities, hooks formed upon the lower ends of the side bars to engage beneath a barrel, a U-shaped lever having its arms pivoted by their extremities to the side bars, links pivotally connecting the arms of the lever and the cross-bar to move the cross-bar vertically upon

the side bars, and connected pawls carried upon the cross-bar to simultaneously engage the ratchet-teeth of both side bars.

8. In a barrel-heading press, side bars arranged to engage beneath the bottom chime of and extend at opposite sides above the barrel and having ratchet-notches formed adjacent their upper ends, a cross-bar provided at each end with a clip loosely embracing the side bars, a substantially U-shaped lever with each free end pivoted to one of the side bars intermediate its ends and proportioned to pivotally swing above the upper ends of the side bars and the cross-bar, a link connecting each end of the cross-bar with the lever adjacent its pivoted ends, and connected pawls pivotally mounted upon the cross-bar and arranged to engage the ratchet-notches of the side bars.

812,912. **WRAPPING-MACHINE.** MILTON H. BALLARD, Lynn, Mass., assignor to Tripp Fruit Wrapping Machine Company, a Corporation of Maine. Filed Feb. 13, 1904. Serial No. 193,262.



Claim.—1. In a wrapping-machine, a hopper having a narrow exit, two agitators therein located at opposite sides of said exit, pivoted operating-levers connected to said agitators, a pivoted lever connected to one of said operating-levers, a rotating cam for operating it, and a sliding bar connected to the other operating-lever, and a rotating cam for operating it, substantially as described.

2. In a wrapping-machine, a trough for the articles having a shoulder at the end, a lifting-lever, and a lifter, for bodily lifting the article next said shoulder, pivotally connected to said lever, and means for operating said lifting-lever, substantially as described.

3. In a wrapping-machine, a trough for the article having a shoulder at the end and having an opening in its bottom next said shoulder, a pivoted lifting-lever, and a lifter contained in said opening, pivotally connected to said lever and means for guiding said lifter in a straight line as the lifting-lever moves on its pivot, substantially as described.

4. In a wrapping-machine, a trough for the article having a shoulder at the end, a lifting-lever, a support pivotally connected thereto, and a lifting-plate for lifting the article next said shoulder, pivotally connected to said support, and means for operating said lever, substantially as described.

5. In a wrapping-machine, a trough for the article having a shoulder at the end, and having an opening in its bottom next said shoulder, a pivoted lifting-lever, a support pivotally connected to said lever, a lifting-plate contained in said opening for lifting the article next said shoulder, pivotally connected to said support and having arms extending downwardly from its under side, and means for operating said lifting-lever, substantially as described.

6. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a stop-motion for the machine having a controlling member normally located in the path of progress of the articles, a starting-lever for moving said member to abnormal position when starting the machine to place it under the control of the articles, the presence or absence of which thereafter determines the position of said member, substantially as described.

7. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a stop-motion for the machine having a controlling member normally located in the path of progress of the articles, a starting-lever for moving said member to abnormal position when starting the machine, means for holding said member in abnormal position and for releasing it at predetermined intervals, to place it under the control of the articles, the presence or absence of which at such time determining the position of said member, substantially as described.

8. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a stop-motion for the machine having its controlling member normally located in the path of progress of the articles, means for moving said member out of such path when starting the machine, a rotating cam for holding said member out of such path and for placing it under the control of the articles, at predetermined times, permitting its return in case the article is absent, substantially as described.

9. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a clutch mechanism secured to the main shaft for engaging the driving-wheel, a pivoted arm controlling the operation of said clutch mechanism which is normally located in the path of progress of the articles, a starting-lever for moving said arm out of such path and for releasing the clutch mechanism, means for thereafter holding said arm out of such path and for placing it under the control of the articles, at predetermined times, permitting its return in case the article is absent, substantially as described.

10. In a wrapping-machine, the combination of wrapping-devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a stop-motion for the machine comprising a clutch mechanism and having a controlling member normally located in the path of progress of the articles, a starting-lever for releasing said clutch mechanism and for moving said member to abnormal position when starting the machine to place it under the control of the articles and a controlling device permitting the controlling member to act only at predetermined times, substantially as described.

11. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a clutch mechanism secured to the main shaft for engaging the driving-wheel, having an outwardly-projecting arm, means for restraining said arm, a wedge-block controlling said means, a pivoted arm, for moving said wedge-block, which is normally located in the path of progress of the articles, means for moving said wedge-block to raise the arm out of such path and also release the clutch mechanism, means for holding said arm in its elevated position, and for placing it under the control of the articles at predetermined times, permitting its return in case the article is absent, substantially as described.

12. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a clutch mechanism secured to the main shaft for engaging the driving-wheel, a pivoted arm controlling the operation of said clutch mechanism which is normally located in the path of progress of the articles, means for moving said arm out of such path and for releasing the clutch mechanism, a rotating cam for holding said arm out of such path and for placing it under the control of the article at predetermined times, permitting its return in case the article is absent, substantially as described.

13. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a clutch mechanism secured to the main shaft for engaging the driving-wheel, a pivoted arm controlling the operation of said clutch mechanism, which is normally located in the path of progress of the articles, a cam having a handpiece attached to it for moving said arm out of such path and for releasing the clutch mechanism, and means for holding said arm out of such path, and for placing it under the control of the article at predetermined times, permitting its return in case the article is absent, substantially as described.

14. In a wrapping-machine, the combination of wrapping devices, means for operating them, means for delivering the articles to said wrapping devices, means for feeding severed wrappers to said wrapping devices, a clutch mechanism secured to the main shaft for engaging the driving-wheel, having an outwardly-projecting arm, means for restraining said arm, a wedge-block controlling said means, a pivoted arm, for moving said wedge-block, which is normally located in the path of progress of the articles, a cam having a handpiece attached to it located beside the wedge-block-carrying bar which is adapted to engage said bar, or block thereon, and move said arm out of such path, and also release the clutch mechanism,

and means for holding said arm out of such path and for placing it under the control of the article at predetermined times, permitting its return in case the article is absent, substantially as described.

15. In a wrapping-machine, a set of jamming or pinching jaws, means for moving them toward and from each other, and means for disengaging the jammed or pinched wrapper from said jaws as they recede, substantially as described.

16. In a wrapping-machine, a rest for holding the orange with its wrapper partially enveloping it, a set of jaws for gathering in the edges of the wrapper and for jamming or pinching said edges together, means for moving said jaws toward and from each other, and means for disengaging the jammed or pinched wrapper from the jaws as they recede and while the orange is supported by said rest, substantially as described.

17. In a wrapping-machine, a rest for holding the orange with its wrapper partially enveloping it, a set of jaws for gathering in the edges of the wrapper and for jamming or pinching said edges together, means for moving said jaws toward and from each other, means for disengaging the jammed or pinched wrapper from the jaws as they recede and while the orange is supported by said rest, and means for removing the wrapped orange from the rest after the wrapper has been disengaged from the jaws, substantially as described.

18. In a wrapping-machine, a set of jamming or pinching jaws for the wrapper, means for moving them toward and from each other, and disengaging devices for the wrappers located in proximity to said jaws, substantially as described.

19. In a wrapping-machine, a set of jamming or pinching jaws for the wrapper, means for moving them toward and from each other, a yielding plate normally projecting from the inner edge of each jaw, which acts to disengage the wrapper therefrom, substantially as described.

20. In a wrapping-machine, the combination with paper feeding and severing devices, and means for adjusting said feeding devices, of a set of jamming or pinching jaws, means for moving them toward and from each other, and a limiting-stop for regulating the distance apart said jaws shall move, substantially as described.

21. In a wrapping-machine, the combination with wrapping devices, and means for operating them, a wrapper-support and means for feeding a wrapper thereto, a rest located beneath said wrapper-support, a plunger-rod, means for moving said rod vertically, a pin projecting from said rod, a swinging bracket having a vertical groove for said pin, and means for swinging said bracket on its vertical axis to thereby correspondingly turn the plunger-rod, substantially as described.

22. In a wrapping-machine, a plunger, means for operating it, a rest for the article supported by a rod having ratchet-teeth, a spring for lifting said rest, a locking device for said rest consisting of a spring-held pawl which engages the ratchet-teeth, a cam on the plunger-rod for disengaging said pawl to release the rest, a latch for holding said pawl disengaged, and a pin on the plunger-rod for releasing said latch, substantially as described.

23. In a wrapping-machine, a rest upon which the wrapped article is deposited, means for moving it vertically, a horizontally-swinging ejector-arm, an operating-bar connected to it and a rotating cam into engagement with which said bar is held pressed by a spring, substantially as described.

24. In a wrapping-machine, a rest upon which the wrapped article is deposited, means for moving it vertically, a horizontally-swinging ejector-arm, an operating-bar connected to it, a cam for operating said bar and a power-driven shaft bearing said cam, substantially as described.

812,913. **HARNESS.** GRANT B. BENNETT, Cleveland, Ohio. Filed Dec. 27, 1904. Serial No. 238,306.

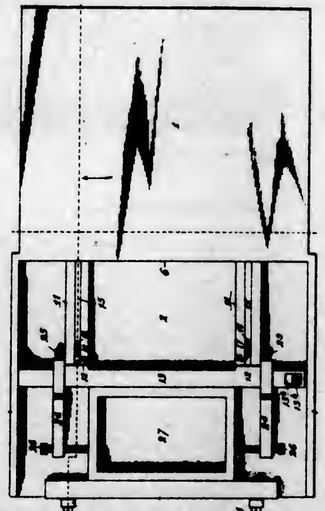
Claim.—1. The combination in a harness of both a hame-collar and a breast-collar with the hame-collar depressed or built in at the place where it engages the breast-collar, whereby the hame-collar has no draft-bearing below the upper line of the breast-collar and having two short tugs connecting with an equaliser to which the trace is attached.

2. The combination in a harness of both a breast and a hame collar with the hame-collar built in to take no draft-bearing below the upper line of the breast-collar and having the breast-collar suspended from the hame or hame-collar by adjustable straps and with two short tugs connecting with an equaliser to which the trace is attached.

3. The combination in a harness of both a breast-collar and a hame-collar with the hame-collar depressed or built in below the upper line of the breast-collar and with two short tugs connecting with the trace by means of a combined equaliser and buckle as set forth.

4. The combination in a harness of both a hame-collar and a breast-collar and having the hame-collar built in or depressed below the line where it engages the breast-collar and having the breast-collar suspended from the hame or hame-collar by adjustable straps and having two short tugs connecting with the trace (or tug) by a combined equaliser and buckle (buckle-trace) substantially as set forth.

812,914. **BED-LOCK FOR INK-TABLE DISTRIBUTION-PRESSES.** JOHN C. BERNINGHAM, Kansas City, Mo. Filed May 15, 1905. Serial No. 260,666.



Claim.—1. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets provided with ratchet-teeth, extension-bars slidably arranged in the pockets adapted to be slid into contact with the chase, and means carried by the extension-bars for automatically engaging the ratchet-teeth to prevent accidental backward movement of said extension-bars.

2. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets provided with ratchet-teeth, extension-bars slidably arranged in the pockets adapted to be slid into contact with the chase, ratchet-teeth-engaging devices carried by the extension-bars, and means for releasing said engaging devices.

3. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets provided with ratchet-teeth, extension-bars slidably arranged in the pockets adapted to be slid into contact with the chase, pawls pivotally secured to said extension-bars for engaging the ratchet-teeth, and means for releasing said pawls.

4. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets provided with ratchet-teeth, extension-bars slidably ar-

ranged in the pockets adapted to be slid into contact with the chase,

gage said segments and determine the space between the main and

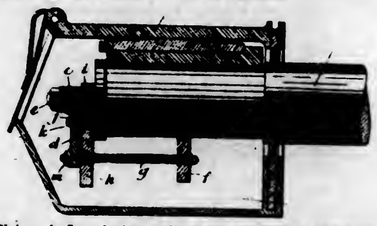
ranged in the pockets adapted to be slid into contact with the chase, ratchet-tooth-engaging devices carried by said extension-bars, and means for releasing said engaging devices from the ratchet-teeth.

5. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets provided with ratchet-teeth, extension-bars slidably arranged in the pockets adapted to be slid into contact with the chase and provided with dovetail grooves, sliding bars snugly fitting in said grooves, ears on the rear ends of the extension-bars, and gravity-pawls engaged by the sliding bars provided with trunnions pivoted in the ears.

6. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets, extension-bars slidably arranged in the pockets, means for preventing accidental backward movement of said extension-bars, and a transverse bar formed integral with the extension-bars adapted to be drawn into contact with the chase.

7. In an apparatus of the character described, the combination with a type-bed and a chase, of an ink-distribution table having pockets, extension-bars slidably arranged in the pockets, means for preventing accidental backward movement of said extension-bars, a transverse bar formed integral with the extension-bars adapted to be drawn into contact with the chase, and side lock-clamps adjustably and detachably mounted upon said transverse bar.

812,915. JOURNAL-LUBRICATOR. AUSTIN BEMAY, Ottawa, Canada. Filed Dec. 27, 1904. Serial No. 238,000.



Claim.—1. In a device of the class described the combination with the journal-box, and the journal, of a pin integral and axial with the end of the journal a lubricating device and means wholly out of contact with the journal-box for supporting said lubricating device from said axial pin substantially as described.

2. In a device of the class described the combination with the journal of a pin axial and integral with the end thereof a downwardly-extending arm loosely supported by the said pin, a lubricating-wheel supported by the said arm, means independent of the arm for transmitting the motion of the journal to the said wheel substantially as described.

3. In a device of the class described the combination with the journal of a pin integral with the end thereof, a downwardly-extending arm loosely supported by the same, a shaft supported by the arm, a sleeve supported by the said shaft, a gear-wheel fixed to the said sleeve, gearing for transmitting the motion of the journal to the said gear-wheel and means on the sleeve for bringing and applying the lubricant to the under side of the journal.

4. In a device of the class described the combination with the journal of a pin integral with the end thereof, a downwardly-extending arm loosely supported by the same, a shaft supported by the arm, a sleeve supported by the said shaft, a gear-wheel fixed to the said sleeve, gearing for transmitting the motion of the journal to the said gear-wheel and a lubricating-wheel on the said sleeve adapted to bring and apply the lubricant to the under side of the journal.

5. In combination in a device of the class described, an axle or journal having an axial pin extending therefrom, an arm loosely supported on the said pin, a shaft supported on the arm, a sleeve on the said shaft, a lubricating-wheel carried by the sleeve and gearing between the said sleeve and the axial pin of the journal, substantially as described.

812,916. ADJUSTABLE FACE-PLATE. FRANK A. DENEF, South Bend, Ind., assignor to Mast Concrete Machinery Company, South Bend, Ind., a Corporation of Indiana. Filed Oct. 21, 1905. Serial No. 283,749.

Claim.—1. A face-plate for block-molds, comprising a main plate, an auxiliary plate at one end of the same and having depending toothed segments, and screws carried by said main plate to engage said segments and determine the angle between the main and auxiliary plates.

2. A face-plate for block-molds comprising a main plate, an auxiliary plate at one end of the same, and means mounted on said plates to position the same at a predetermined angle to each other.

3. A face-plate for building-block molds, comprising a main plate having an opening at one end of the same, an auxiliary plate at one end of the same and having depending toothed segments extending through said opening, screws engaging said segments and said main plate to hold the auxiliary plate in position, lugs carried by the main plate, and screws in said lugs engaging the inner and outer edges of the auxiliary plate for the purpose of adjusting the same.

812,917. INDIVIDUAL SAFETY GARMENT-RACK. HERMAN J. BOURALL, Cleveland, Ohio, assignor of one-half to A. B. Honsaker, Cleveland, Ohio. Filed July 10, 1905. Serial No. 269,099.

Claim.—1. In individual safety garment-racks, a rear part and a door hinged thereon at one end and adapted to swing horizontally, a hat-support fixed on the said rear part and overhanging the space between said parts, and a projection on the inside of said door adapted to press the brim of the hat against said rear part and secure it against removal.

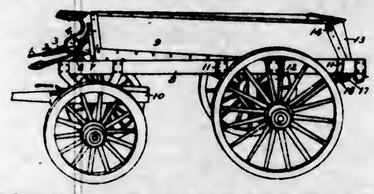
2. In individual safety garment-racks, a back part and a front part hinged thereon at one end and adapted to swing horizontally on its hinges, and means on said parts to lock them together comprising a spring-catch 3 on the rear part, a fixed headed bolt on the door adapted to engage in said catch, and a key having a tapered head adapted to spread said catch and release the bolt.

3. In individual safety garment-racks, the rear part and the door hinged thereon, in combination with a double-sided spring-catch 3 fixed in said rear part, a headed bolt on the door adapted to engage with said catch, a key having a tapered head adapted to spread said catch and release the bolt, and provided with an annular channel at the base of said head, and a stop in the door to engage in said channel and prevent the key from being removed when the door is open.

4. In individual safety garment-racks, the back part and the door, in combination with a bolt on the door and a spring-catch on the back part to engage the same, a key constructed to spread said catch and release the bolt, a plate adapted to engage said key when the door is open and prevent the withdrawal thereof and a projection on said rear part to raise said plate from the key and allow the key to be removed when the door is closed.

812,918. DUMPING-WAGON. JAMES H. BRIGGS, Waterloo, Iowa. Filed Dec. 15, 1904. Serial No. 236,982.

Claim.—1. In a dumping-wagon, the combination with the wheeled axles, of a frame mounted thereon, a box fulcrumed within the frame for vertical rocking movement, means for releasably fastening down the front end of said box, a foot-actuated lever for detaching said fastening means, a spring connected between said foot-actuated lever and the frame, and a tilting end-gate pivoted to the upper part of the rear end of said box and adapted to be automatically closed and held under spring tension when said box is shifted to its normal position.



2. In a dumping-wagon, the combination with wheeled front and rear axles, of a frame supported thereon, a box fulcrumed at a point a short distance in front of its center of gravity within said frame, contact-pieces on the front of said box, a clutch pivoted to said frame and adapted to releasably engage said contact-pieces, a foot-actuated lever connected to said clutch, a tilting end-gate pivoted to said box adapted to automatically tilt into an inclined position away from said box upon the rocking of the box a transverse rod carried by the frame, spring members carried by the end-gate adapted to engage said rod when the box is shifted to its normal position, an adjusting-bar attached to said end-gate, and means for linking said adjusting-bar to said box to retain said end-gate when tilted within the desired limit of opening.

3. In a dumping-wagon, the combination with wheeled front and rear axles, of a frame supported thereon, a box fulcrumed within the frame for vertical rocking movement, contact-pieces on the front of said box, a clutch pivoted to said frame and adapted to releasably engage said contact-pieces, a foot-actuated lever connected to said clutch, a spring connected between said foot-actuated lever and said frame, a tilting end-gate pivoted to said box adapted to automatically tilt into an inclined position away from said box upon the rocking of the box, means for holding said end-gate closed under spring tension when the box is in its normal position, an adjusting-bar attached to said end-gate, means for linking said adjusting-bar to said box to retain said end-gate when tilted within the desired limit of opening, and means for preventing the closing of said end-gate when tilted into any desired open position.

4. In a dumping-wagon, the combination with a frame, of a box fulcrumed therein, said box gradually increasing in width from front to rear, a tilting end-gate pivoted to said box, a transverse rod carried by the frame, spring members carried by the end-gate adapted to engage said rod when the box is in its normal position, means for linking the lower part of said end-gate to said box to adjust in a desired degree the width of opening thereof, and means for preventing the closing of said end-gate when once opened to any desired degree of adjustment.

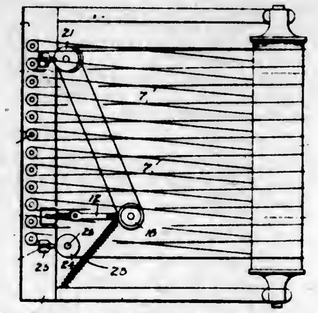
5. In a dumping-wagon, the combination with wheeled front and rear axles, of a frame mounted upon said axles, a box pivoted for rocking movement in said frame, lugs carried by the front end of said box, a yoke pivoted for rocking movement upon the front axle and adapted to engage said lugs, a foot-lever for actuating said yoke, a spring which normally holds said yoke in engagement with the lugs, a swinging end-gate pivoted to the wagon-body and means for holding said end-gate closed under spring tension when the box is in its normal position.

812,919. TENSION DEVICE FOR SPINNING-FRAMES. ROBERT G. CARLE, Blackstone, Mass. Filed May 23, 1905. Serial No. 261,261.

Claim.—1. In a spindle-driving device, the combination with a driving-drum, spindles, a driving-band, of a double pulley carried by the frame, a pivoted arm carrying a single pulley, the driving-band passing once around said single pulley and twice over the double pulley, and a spring exerting tension on the pivoted arm, substantially as described.

2. The combination with the frame and the drum, spindles journaled therein, of a double pulley suitably carried by the frame at one end, a single pulley carried by the frame at the other end, an arm pivotally connected to the frame and carrying a single pulley at its outer end, a driving-band passing around the drum and spindles, and also passing twice around the double pulley and once around the single pulley and having a looped portion extending from the double pulley to the pulley on the pivoted arm, and a spring exerting tension on said pivoted arm, substantially as described.

3. In a device of the character described, the combination with the spindle-driving band, of a bracket having a recess, an arm having a hinge-pin projecting into said recess, an oil-duct in said bracket leading to said recess, and a retaining device covering said oil-duct and engaging the flange on the end of the arm, substantially as described.



4. In a device of the class described, the combination with the driving-band, of a supporting-bracket having a recess therein, an idle pulley having an axle-pin journaled in said recess and a retaining-plate engaging the flange of the pulley for holding the pin in the recess, substantially as described.

812,920. ANATOMICAL FOOTWEAR. HARLAN P. COLE, Hartford, Conn., assignor to Nettie D. Cole, Hartford, Conn. Filed Feb. 16, 1904. Serial No. 193,802.

Claim.—1. Footwear having a sole laterally extended on one side, and a heel also laterally extended on one side to conform to the extension of the sole, said heel being forwardly extended on one side beneath the shank, whereby the weight of the body is thrown within the space occupied by the lateral extension of the sole and the forward and lateral extension of the heel, and turning of the ankle is prevented.

2. Footwear having a heel extended laterally beyond the normal sole to sustain the foot and extended forwardly on the inner side over the shank, whereby the line of weight of the body is thrown within the space occupied by said heel, and rocking of the foot on its longitudinal axis is prevented.

812,921. BASE-BALL GLOVE. EARLE H. DECKER, Keokuk, Iowa, assignor of one-half to George J. Stilley, Joliet, Ill. Filed Nov. 15, 1904. Serial No. 232,902.

Claim.—1. A glove comprising an inflatable cushion, impact-deadening material arranged on one face thereof, and a cover inclosing the same.

2. In a glove, a pneumatic cushion, impact-deadening material arranged on its front and rear faces, a covering for said cushion and impact-deadening material, and means whereby the glove is secured in position.

3. A glove comprising two sections arranged one on the other, a cover for one section, a flap carried thereby and overlapping the

other section, means whereby said last-named section is secured to the flap, a pneumatic cushion arranged in the first-named section, an air-tube therefor projecting through the other section, and a flap normally covering the free end of said tube.

4. In a glove, an inflatable cushion formed with a recess, and a pad arranged in said recess.

5. A glove comprising front and back hinged sections, finger-stalls on said back section, an inflatable cushion between said sections, and an inflating-tube therefor, said tube extending through said back section at a point intermediate two of said finger-stalls.

6. In a glove, an inflatable cushion having its peripheral edge of increased thickness, formed with a core connecting and spacing the front and back faces of said cushion.

812,922. **APPARATUS FOR SMOKING AND CURING MEAT PRODUCTS.** WILLIAM EPPINGER, New York, N. Y. Filed Nov. 2, 1904. Serial No. 231,088.

Claim.—1. An apparatus for curing meat products, consisting of a closed compartment having a door and also an outlet, a valved gas-pipe extending within said compartment and provided with a series of burners near the floor of the compartment, through which gas issues unmixed with air, said compartment being provided with an air-inlet restricted in size relatively to the capacity of the burners and the pressure of gas so that only sufficient air is admitted to support combustion, whereby smoky flames are produced at the burners for the purposes set forth.

2. An apparatus for curing meat products, consisting of a closed compartment provided with a door and also an outlet, a gas-pipe extending across the front of the compartment near the door and the floor, a branch pipe connected to said pipe at a point within the compartment and extending rearward into the compartment near the floor, said branch pipe being provided with burners and being adapted to swing upward and forwardly to near the door-opening, for the purposes set forth.

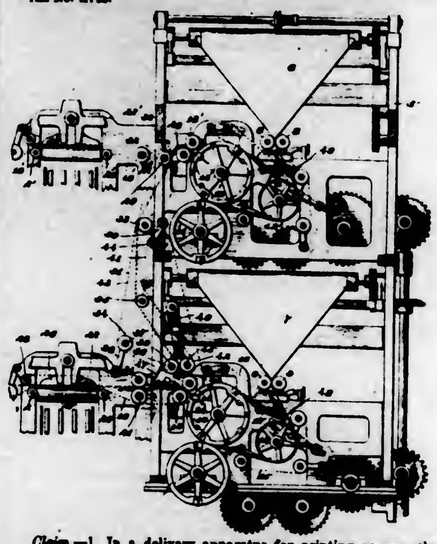
3. An apparatus for curing meat products consisting of a closed compartment having a door, a gas-pipe connected to the bottom of said compartment, and a looped pipe pivoted thereto and having a series of burners from which the gas issues unmixed with air.

4. An apparatus for curing meat products consisting of a closed compartment provided with a door and an outlet and also with a restricted air-inlet, a number of gas-burners in the bottom thereof, from which the gas issues unmixed with air, an escape-flue extending therefrom, and an automatic damper in the escape-flue, whereby the gas is consumed with an unsatisfied combustion and the meat products are cured by the products of combustion.

5. An apparatus for curing meat products consisting of a closed compartment provided with a door and an outlet and also with a restricted air-inlet, a number of gas-burners in the bottom of the compartment from which the gas issues unmixed with air, a perforated draft-tube extending across the top of the compartment, and an escape-pipe connected with the draft-tube, whereby the gas is consumed with an unsatisfied combustion and the meat products are cured by the products of combustion.

6. An apparatus for curing meat products consisting of a closed compartment having means for holding meat products therein, said compartment being provided with a door and an outlet and also with a restricted air-inlet a number of gas-burners in the bottom of said compartment from which the gas issues unmixed with air, a perforated draft-tube extending across the top of said compartment, an escape-pipe connected with said draft-tube, and an automatic damper in said escape-pipe, whereby the gas is consumed with an unsatisfied combustion and the meat products are cured by the products of combustion.

812,928. **DELIVERY APPARATUS FOR PRINTING-PRESSES.** SAMUEL C. GOSS, Chicago, Ill., assignor to Goss Printing Press Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 10, 1900. Serial No. 4,762.



Claim.—1. In a delivery apparatus for printing-presses, the combination with a plurality of longitudinal folders arranged one above another of a plurality of transverse-folding devices, and means for assembling sheets from said folding devices after they have been folded transversely, substantially as described.

2. In a delivery apparatus for printing-presses, the combination with a plurality of longitudinal folders arranged one above another of a plurality of transverse-folding devices, means for assembling sheets from said folding devices after they have been folded transversely, and means for imparting an additional fold to said assembled sheets, substantially as described.

3. In a delivery apparatus for printing-presses, the combination of a plurality of longitudinal folders arranged one above another, transverse-folding mechanism, means for either assembling sheets from said transverse-folding mechanism after they have been folded transversely, or for assembling longitudinally-folded webs before folding them transversely, substantially as described.

4. In a delivery apparatus for printing-presses, the combination of a plurality of sets of printing mechanism, a set of delivery apparatus for each of said sets of printing mechanism, each of said sets of delivery apparatus being adapted to separately deliver the products of the set of printing mechanism with which it is connected each of said sets of delivery apparatus comprising transverse cutting and folding mechanism, a second folding device cooperating with each of said sets of delivery apparatus for folding the sheets again after they have received the first transverse fold, and means for assembling sheets from said sets of delivery apparatus before receiving the second fold and after they have received the first transverse fold, substantially as described.

5. In a delivery apparatus for printing-presses, the combination of a plurality of sets of printing mechanism arranged one above another, means for connecting and disconnecting said sets of printing mechanism so that they may be run together or independently, a set of delivery apparatus for each of said sets of printing mechanism, each of said sets of delivery apparatus comprising mechanism for severing the web transversely and for imparting the first transverse fold thereto, and means for associating the sheets from one of said sets of delivery apparatus with those of another of said sets of delivery apparatus after they have received a transverse fold, substantially as described.

6. In a printing-press, the combination of a plurality of sets of printing mechanism arranged one above another, means for running said sets of printing mechanism separately or together, means for folding the webs of said printing mechanisms longitudinally, transverse-folding mechanism for each set of printing mechanism, means for associating transversely-folded sheets from one of said transverse-folding mechanisms with those of another of said transverse-folding mechanisms, and means for conducting a web from one of said sets of printing mechanism and associating it with the web of another of said sets of printing mechanism, means for cutting the associated webs into sheets and folding said sheets transversely.

7. In a printing-press, the combination of a plurality of sets of printing mechanism, a set of delivery apparatus for each of said sets of printing mechanism, each set of delivery apparatus having transverse-folding mechanism, means for running said sets of printing mechanism together or separately, means for delivering the product of each of said sets of printing mechanism independently, and means for conducting sheets, after folding them transversely, from one of said sets of delivery apparatus to the other, substantially as described.

8. In a printing-press, the combination of a plurality of sets of printing mechanism arranged one above another, means for driving said sets of printing mechanism synchronously, a set of delivery apparatus connected with each of said sets of printing mechanism, means for delivering the product of each of said sets of printing mechanism independently of the other, mechanism for conducting the product of one of said sets of delivery apparatus to another set of delivery apparatus after it has received a transverse fold, and a switch for controlling the operation of said delivery apparatus, substantially as described.

9. In a printing-press, the combination of a plurality of sets of printing mechanism, means for driving said sets of printing mechanism independently or together, a set of delivery apparatus for each of said sets of printing mechanism, and associating mechanism arranged to be operated to associate the products of said sets of printing mechanism either before or after they receive the first transverse fold, substantially as described.

10. In a printing-press, the combination of a plurality of sets of printing mechanism arranged one above another, means for driving said sets of printing mechanism separately or together, a set of delivery apparatus connected with each of said sets of printing mechanism, means for either conducting the web from one of said sets of printing mechanism to and associating it with the web of another of said sets of printing mechanism and afterward cutting the associated webs into sheets, or for associating separate sheets from one of said sets of printing mechanism with those of another of said sets of printing mechanism, substantially as described.

11. The combination with printing mechanism, of a plurality of delivery mechanisms arranged one above another, each of said delivery mechanisms having transverse-folding devices, and means operating in connection therewith for delivering sheets therefrom, means for assembling sheets from said folding devices after they have been folded transversely, and means for imparting an additional fold to the assembled sheets, substantially as described.

12. In a delivery apparatus for printing-presses, the combination of a plurality of longitudinal folders, a plurality of transverse-folding mechanisms, and means for either assembling sheets from said transverse-folding mechanisms after they have been folded transversely, or for assembling longitudinally-folded webs before folding them transversely, substantially as described.

13. In a delivery apparatus, the combination of a plurality of folding devices for imparting the first fold to sheets after they have been severed from the web, means for supplying sheets to said folding devices, and means for conducting folded sheets from one of said folding devices to and associating them with folded sheets from the other folding device, and then again folding the associated sheets, substantially as described.

14. The combination with a plurality of sets of printing mechanism arranged one above another, of a plurality of transverse-folding devices, separate means operating in connection with each of said transverse-folding devices for delivering sheets therefrom, means for assembling sheets from said folding devices after they have been folded transversely, and means for imparting an additional fold to the assembled sheets, substantially as described.

15. In a printing-press, the combination of a plurality of sets of printing mechanism, mechanism operating in connection with each of said sets of printing mechanism for folding sheets after they have been severed from the web, and means for conducting folded sheets from one of said folding mechanisms to the other folding mechanism and there imparting to them an additional fold, substantially as described.

16. In a printing-press, the combination of a plurality of sets of printing mechanism, mechanism operating in connection with each of said sets of printing mechanism for folding sheets after they have

been severed from the web, and means for conducting folded sheets from one of said folding mechanisms to the other folding mechanism, and there folding them with sheets from the other set of printing mechanism, substantially as described.

17. In a delivery apparatus, the combination of a plurality of folding devices for imparting the first fold to sheets after they have been severed from the web, means for driving said folding devices separately or together, and means operating in connection with each of said folding devices for separately delivering sheets or for assembling and folding together sheets from said folding devices, substantially as described.

18. In a printing-press, the combination of a plurality of sets of printing mechanism, means for running said sets of printing mechanism separately or together, transverse-folding mechanism for each set of printing mechanism, means for associating transversely-folded sheets from one of said transverse-folding mechanisms with those of another of said transverse-folding mechanisms, and means for conducting a web from one of said sets of printing mechanism to and associating it with the web of another of said sets of printing mechanism, substantially as described.

19. In a printing-press, the combination of a plurality of sets of printing mechanism, means for running said sets of printing mechanism separately or together, means for folding the webs of said printing mechanisms longitudinally, transverse-folding mechanism for each set of printing mechanism, means for associating transversely-folded sheets from one of said transverse-folding mechanisms with those of another of said transverse-folding mechanisms, and means for conducting a web from one of said sets of printing mechanism, after it has been folded longitudinally, to and associating the same with the web of another of said sets of printing mechanism, means for cutting the associated webs into sheets and folding said sheets transversely.

20. In a printing-press, the combination of a plurality of sets of printing mechanism, means for driving said sets of printing mechanism separately or together, a plurality of sets of delivery apparatus, each having transverse-folding mechanism, means for conducting a web from one of said sets of printing mechanism to and associating the same with the web of another of said sets of printing mechanism or for conducting the webs from the different sets of printing mechanism to different sets of delivery apparatus and separately severing them into sheets and folding the sheets transversely, and afterward associating transversely-folded sheets from said sets of delivery apparatus, substantially as described.

21. In a delivery apparatus for printing-presses, the combination of a plurality of longitudinal folders, a plurality of transverse-folding mechanisms, and means for either assembling folded sheets from said transverse-folding mechanisms after they have been folded transversely or for assembling longitudinally-folded webs, substantially as described.

22. In a delivery apparatus for printing-presses, the combination of a plurality of sets of printing mechanism, means for connecting and disconnecting said sets of printing mechanism so that they may be run together or independently, a set of delivery apparatus for each of said sets of printing mechanism, each of said sets of delivery apparatus comprising mechanism for severing the web transversely and for imparting the first transverse fold thereto, and means for associating the sheets from one of said sets of delivery apparatus with those of another of said sets of delivery apparatus after they have received the first transverse fold, substantially as described.

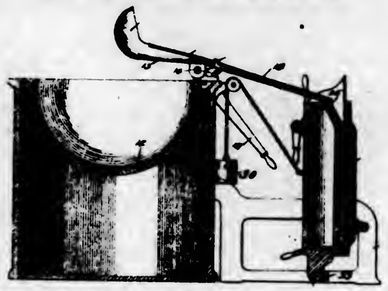
23. In a printing-press, the combination of a plurality of sets of printing mechanism, means for driving said sets of printing mechanism synchronously, a set of delivery apparatus connected with each of said sets of printing mechanism, means for delivering the product of each of said sets of printing mechanism independently of the other, mechanism for conducting the product of one of said sets of delivery apparatus to another set of delivery apparatus after they have received the first transverse fold, and a switch for controlling the operation of said delivery apparatus, substantially as described.

24. In a printing-press, the combination of a plurality of sets of printing mechanism, means for driving said sets of printing mechanism separately or together, a set of delivery apparatus connected with each of said sets of printing mechanism, means for either conducting the web from one of said sets of printing mechanism to and associating it with the web of another of said sets of printing mechanism and afterward cutting the associated webs into sheets, or for associating separate sheets from one of said sets of printing mechanism with those of another of said sets of printing mechanism, substantially as described.

25. In a printing-press, the combination of printing mechanism

arranged to print a plurality of products, a plurality of sets of delivery apparatus, and associating mechanism arranged to be operated to associate said products either before or after they receive the first transverse fold, substantially as described.

812,924. **STEREOTYPING APPARATUS.** SAMUEL G. GOSS, Chicago, Ill., assignor to Goss Printing Press Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 21, 1903. Serial No. 144,569.



Claim.—1. In a casting apparatus, the combination of a pivotally-mounted casting-box, means for maintaining a supply of molten metal, a pivoted ladling apparatus for transferring molten metal from said source of supply to the casting-box, and means operatively connecting said casting-box and ladling apparatus so that when said casting-box is raised into position to receive a charge said ladling apparatus is actuated to take up a supply of molten metal, substantially as described.

2. In a casting apparatus, the combination of a casting-box movable into and out of position to receive a charge, means for maintaining a supply of molten metal, and means operated by the movement of the casting-box into position to receive a charge, for elevating molten metal into position to be supplied thereto, substantially as described.

3. In a casting apparatus, the combination of a casting-box movable into and out of position to receive a charge, means for maintaining a supply of molten metal, and ladling mechanism operated by the movement of the casting-box into position to receive a charge, for elevating molten metal into position to be supplied thereto, and means for simultaneously actuating said ladling apparatus and casting-box to deliver molten metal to said casting-box substantially as described.

4. In a casting apparatus, the combination of a pivotally-mounted casting-box, means for maintaining a supply of molten metal, and means operated by the movement of the casting-box into position to receive a charge, for elevating molten metal into position to be supplied thereto, substantially as described.

5. In a casting apparatus, the combination of a casting-box, a swinging ladle, and separate means intermediately disposed between the casting-box and the ladle for conducting molten metal from said ladle to the casting-box, substantially as described.

6. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a pivotally-mounted ladle, and separate means between the casting-box and the ladle for conducting molten metal from said ladle to the casting-box, substantially as described.

7. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle having a tubular stem, means for tilting said ladle to discharge the contents thereof through said stem, and separate means between the casting-box and the ladle for conducting the molten metal from said ladle to the casting-box, substantially as described.

8. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle having a tubular stem, means for tilting said ladle to discharge the contents thereof through said stem, and a separate pivotally-mounted spout for conducting the molten metal from said ladle to the casting-box, substantially as described.

9. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle having a tubular stem, and means operated by the movement of the casting-box into position to receive a charge, for tilting said ladle, substantially as described.

10. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle having a tubular stem, means operated by the movement of the casting-box into position to receive a charge, for tilting said ladle, and means for conducting the molten metal from said ladle to the casting-box, substantially as described.

11. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle having a tubular stem pivotally mounted adjacent to the source of supply of molten metal, and a spout adapted to receive molten metal from the stem of said ladle and discharge it into the casting-box, said spout and ladle being angularly adjustable, substantially as described.

12. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle having a tubular stem pivotally mounted adjacent to the source of supply of molten metal, a spout adapted to receive molten metal from the stem of said ladle and discharge it into the casting-box, said spout and ladle being angularly adjustable, means for moving said spout into operative position, and means for tilting said ladle after said spout is in its operative position, substantially as described.

13. In a casting apparatus, the combination of a casting-box, a metal-holding receptacle, a pivoted ladle having a tubular stem, a separate spout adapted to conduct molten metal from said stem to the casting-box, and means for moving said ladle and spout into and out of operative position, substantially as described.

14. In a casting apparatus, the combination of a casting-box, a metal-holding receptacle, a pivoted ladle, a spout adapted to conduct molten metal from said ladle to the casting-box, means for moving said ladle and spout into and out of operative position, and means for tilting said ladle to discharge its contents into said spout, substantially as described.

15. In a casting apparatus, the combination of a casting-box, a receptacle for molten metal, a shaft, a crank for rocking said shaft, said crank being adapted to rock slightly independently of said shaft, means operated by the movement of the casting-box into position to receive a charge, for operating said crank to rock said shaft, a spout loosely mounted on said shaft and rigidly connected with said crank, a ladle mounted on and keyed to said shaft, said ladle being adapted to discharge into said spout, and means independent of said crank for rocking said shaft, substantially as described.

16. In a casting apparatus, the combination of a pivoted casting-box, a crank connected therewith, a receptacle for molten metal, a shaft arranged adjacent thereto, a crank loosely mounted on said shaft, a collar fixedly secured on said shaft, said collar having a recess, a lug carried by the latter crank and projecting into said recess, a spout loosely mounted on said shaft and rigidly connected with the latter crank, a ladle mounted on and keyed to said shaft and adapted to dip into said molten-metal receptacle, said ladle being adapted to discharge into said spout, a lever for rocking said shaft, and a connecting-rod connecting said cranks, substantially as described.

17. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle, and means, operated by the movement of the casting-box into position to receive a charge, for tilting said ladle, substantially as described.

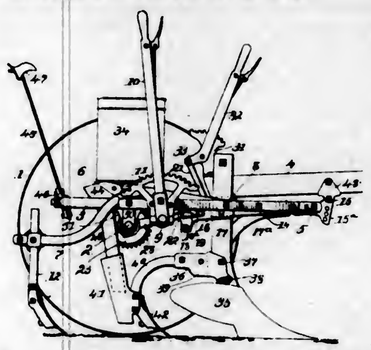
18. In a casting apparatus, the combination of a casting-box, means for maintaining a supply of molten metal, a ladle, means, operated by the movement of the casting-box into position to receive a charge, for tilting said ladle, and means for conducting the molten metal from said ladle to the casting-box, substantially as described.

812,925. **PLANTER.** WILLIAM S. GRAHAM, Canton, Ill., assignor to Parlin & Orendorff Company, Canton, Ill., a Corporation of Illinois. Filed Nov. 6, 1905. Serial No. 286,114.

Claim.—1. In a planter the combination with the frame and carrying-wheels, of a tongue, a draft-beam pivotally connected with the tongue at its forward end, a furrow-former secured to the rear end of the draft-beam, means for raising and lowering the rear end of the tongue at a certain speed and to a certain extent, and means for simultaneously raising and lowering the rear end of the draft-beam at a slower speed and to a less extent.

2. In a planter, the combination with the frame and carrying-wheels, of a tongue, a draft-beam pivotally connected to the tongue at its forward end, a standard stiffly secured to the draft-beam, a furrow-former on the standard, a lever to raise and lower the rear end of the tongue to a certain extent, and a shorter lever for simultaneously raising and lowering the rear end of the draft-beam to a less extent.

3. In a planter the combination with the frame and carrying-wheels, of a tongue, a draft-beam pivotally connected at its front end to the under side of the tongue, a standard stiffly attached to the draft-beam, a team-hitch at the forward end of the draft-beam, a furrow-former secured on the standard, a lever to move the rear end of the tongue to a certain extent and a shorter lever for simultaneously moving the rear end of the draft-beam to a less extent.



4. In a planter, the combination with the frame and the carrying-wheels, of a tongue, a draft-beam pivotally connected at its front end to the under side of the tongue in front of the rear end thereof, a standard stiffly attached to the draft-beam, a furrow-former secured to the draft-beam, a team-hitch at the front end of the draft-beam and a lever having a longer extension connected with the rear end of the tongue and a shorter extension connected with the rear end of the draft-beam.

5. In a planter, the combination of an axle-shaft, carrying-wheels on the axle-shaft, a tongue, a draft-beam pivotally connected at its front end to the under side of the tongue in front of the rear end thereof, a frame carried on the axle-shaft and pivotally connected with the draft-beam near the front end thereof, a cross-shaft journaled in the frame, a lock-lever for the cross-shaft, a shorter lever extension on the cross-shaft engaging the rear end of the draft-beam, a longer lever extension on the cross-shaft engaging the rear end of the tongue and a furrow-former attached to the draft-beam.

6. In a planter, the combination of an axle-shaft, carrying-wheels on the axle-shaft, a tongue, a draft-beam forked at its rear end and pivotally connected at its front end to the under side of the tongue in front of the rear end thereof, a frame carried on the axle-shaft and pivotally connected with the draft-beam near the front end thereof, a cross-shaft journaled in the frame, a lock-lever for the cross-shaft, a lever-frame on the cross-shaft having side extensions engaging the forked end of the draft-beam and a longer central extension connected with the rear end of the tongue, and a furrow-former attached to the draft-beam.

7. In a planter, the combination of an axle-shaft, carrying-wheels on the axle-shaft, a tongue, a draft-beam pivotally connected at its front end to the under side of the tongue in front of the rear end thereof, a frame carried on the axle-shaft and pivotally connected with the draft-beam near the front end thereof, diverging arms forming rearward extensions of the draft-beam, said arms having longitudinal grooves, a cross-shaft journaled in the frame, a lock-lever for the cross-shaft, a lever-frame on the cross-shaft having side extensions that engage the grooves of the arms of the draft-beam and a longer central extension, a stiff link pivotally connecting the central extension of the lever-frame with the rear end of the tongue and a furrow-former attached to the draft-beam.

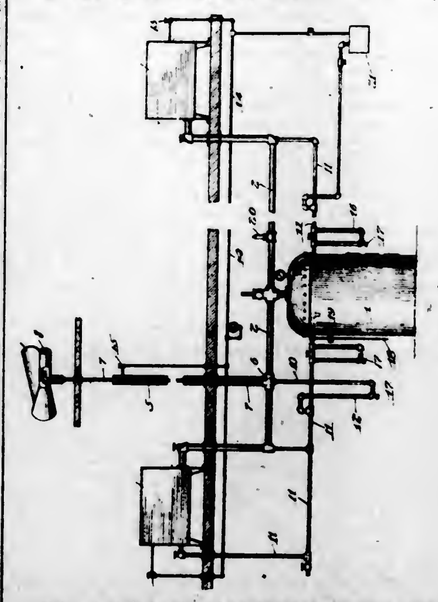
8. In a planter, the combination with the frame, the axle-shaft and the carrying-wheels, of a draft-beam pivotally connected near its front end to the front end of the frame, a tongue pivotally connected to the front end of the draft-beam and extended rearward beyond such connection, a cross-shaft in the frame, a lever extension on the cross-shaft engaging the rear end of the draft-beam, a longer lever extension on the cross-shaft engaging the tongue, arms on the cross-shaft, and rails for covering-shovels pivoted to the frame at their front ends and sustained intermediately on the arms of the cross-shaft.

9. In a planter the combination of an axle-shaft, carrying-wheels on the axle-shaft, a tongue, a draft-beam pivotally connected at its front end to the under side of the tongue in front of the rear end thereof, a frame carried on the axle-shaft and pivotally connected with the draft-beam near the front end thereof, a cross-shaft journaled in the frame, a lock-lever for the cross-shaft, a shorter lever extension on the cross-shaft engaging the rear end of the draft-beam, a longer lever extension on the cross-shaft engaging the rear end of the tongue, a stiff link pivotally connecting the lock-lever on the tongue with the longer lever extension of the cross-shaft, and a furrow-former secured to the draft-beam.

10. In a planter, the combination with the carrying-wheels, the axle-shaft, the frame, the tongue, the draft-beam pivotally connected with the tongue, the furrow-former secured to the draft-beam, the drop-actuating drive-wheel and the clutch connecting the dropping-wheel with the axle-shaft; of the cross-shaft, the lock-lever for the cross-shaft, the lever extension on the cross-shaft connecting with the draft-beam, the longer lever extension on the cross-shaft connecting with the tongue, the clutch-shifting lever having a fulcrum on the cross-shaft, a cam extension on the clutch-shifting lever and a flange on the cross-shaft adapted to force the cam sidewise as the cross-shaft is rocked to raise the furrow-former.

11. In a planter, the combination with the carrying-wheels, the axle-shaft, the frame, the tongue, the draft-beam pivotally connected with the tongue and with the frame, the furrow-former secured to the draft-beam, the rails for the covering-shovels pivotally connected with the frame, the drop-actuating drive-wheel and the clutch connecting the dropping-wheel with the axle-shaft; of the cross-shaft, the lock-lever for the cross-shaft, the lever extension of the cross-shaft connecting with the draft-beam, the longer extension connecting with the tongue, the arms on the cross-shaft extending under the rails for the covering-shovels, the clutch-shifting lever having a fulcrum on the cross-shaft, a cam extension on the clutch-shifting lever and a flange on the cross-shaft adapted to engage the cam.

812,926. **LOW-PRESSURE HEATING SYSTEM.** AMOS HARRISON, Chicago, Ill., assignor of one-fourth to Robert H. Walch, Chicago, Ill. Filed Aug. 25, 1904. Serial No. 223,197.



Claim.—1. A device of the kind described, comprising radiators, conducting-pipes, and a generator for producing a heating medium, in combination with an automatic pressure-reducer and discharge-pipe, consisting of a tube open at one end, means for heating said tube by said heating medium, and means connecting various parts of the system to the other end of said tube to induce a flow of the heating medium to those parts.

2. A device of the kind described, comprising radiators, conducting-pipes, and a generator for producing a heating medium, in combination with an automatic pressure-reducer and discharge-pipe consisting of a substantially vertical tube open at its upper end to the atmosphere means for heating said vertical tube by means of

said heating medium and induction-pipes connecting the lower end of said vertical tube with various parts of the system to induce a flow of the heating medium to those parts.

3. A device of the kind described, comprising radiators, conducting-pipes, and a generator for producing a heating medium, in combination with an automatic pressure-reducer and discharge-pipe consisting of a substantially vertical tube open at its upper end positioned partly within a casing connected to said conducting-pipes, whereby said vertical tube is heated by said heating medium, and induction-pipes connecting the lower end of said vertical tube with various parts of the system to induce a flow of the heating medium to those parts.

4. A device of the kind described, comprising radiators, conducting-pipes, and a generator for producing a heating medium, in combination with an automatic pressure-reducer and discharge-pipe consisting of a substantially vertical tube open at its upper end and provided with a suitable ejector-cowl, means for heating said vertical tube by means of said heating medium and means connecting various parts of the system to the lower part of said vertical tube to induce a flow of the heating medium to those parts.

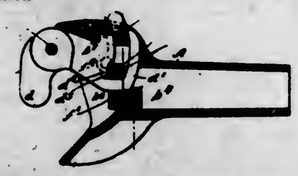
5. A device of the kind described, comprising radiators, conducting-pipes, and a generator for producing a heating medium, in combination with an automatic pressure-reducer and discharge-pipe consisting of a substantially vertical tube open at its upper end and provided with a suitable ejector-cowl, means for heating said vertical tube by means of said heating medium, and induction-pipes connecting the lower end of said vertical tube with various parts of the system to induce a flow of the heating medium to those parts.

6. A device of the kind described, comprising radiators, conducting-pipes, and controlling means and a generator for producing a heating medium, in combination with an automatic pressure-reducer consisting of a substantially vertical tube open at its upper end and provided with a suitable ejector-cowl, said vertical tube being positioned partly within a casing connected to said conducting-pipes, whereby said vertical tube is heated by said heating medium, and induction-pipes connecting the lower end of said vertical tube with various parts of the system to induce a flow of the heating medium to those parts.

7. An automatic pressure-reducer, comprising a tube adapted to be placed in a substantially vertical position, an air-tight casing inclosing a part of the length of said tube, means for connecting said casing to a conducting-pipe whereby a heating medium is admitted to said casing to heat said tube and means for connecting induction-pipes to the lower end of said tube.

8. An automatic pressure-reducer, comprising a tube adapted to be placed in a substantially vertical position provided with an ejector-cowl at its upper end, a casing inclosing a part of the length of said tube, means for connecting said casing to a conducting-pipe, whereby a heating medium is admitted to said casing to heat said tube, and means for connecting induction-pipes to the lower end of said tube.

812,927. CAR-COUPLING. GUSTAF A. HERMANSON, Chicago, Ill., assignor to James Hunter, Maywood, Ill. Filed Oct. 30, 1905. Serial No. 284,927.



Claim.—1. In a car-coupler, the combination with a forked draw-head, of a knuckle having a transversely-extending curved slot in its rear arm or tail and provided with a knuckle-throwing cam or incline, and a vertically-movable lock having a knuckle-throwing leg fitting in said transverse slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline to throw the knuckle open, substantially as specified.

2. In a car-coupler, the combination with the draw-head, of a knuckle having a rear arm or tail furnished with a transversely-extending slot, and provided with a knuckle-throwing cam or incline, and a lock having a lock-set leg and a knuckle-throwing leg fitting within a portion of the knuckle-tail, said knuckle-throwing leg fitting in said slot of the knuckle-tail and provided with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open, said knuckle-throwing leg passing through the knuckle-tail serving also as a means for connecting the knuckle with the draw-head, substantially as specified.

3. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, the lower end of said lock-set leg being also adapted to engage the lower web or floor of the draw-head to set or hold the lock in position for uncoupling, substantially as specified.

4. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, said lock having also a lock-set leg furnished with a ledge or shoulder adapted to engage the lower web or floor of the draw-head to hold the lock in position for uncoupling, substantially as specified.

5. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, said lock having also a lock-set leg furnished with a ledge or shoulder adapted to engage the lower web or floor of the draw-head to hold the lock in position for uncoupling, and the lower end of said knuckle-throwing leg of the lock being also adapted to engage the lower web or floor of the draw-head for holding the lock in position for uncoupling, substantially as specified.

6. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, said lock having a ledge or shoulder adapted to rest upon the knuckle-tail and support the lock when the knuckle begins to swing open, substantially as specified.

7. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, said knuckle-tail being provided with a ledge or shelf adapted to engage the lower end of said knuckle-thrower leg to support the lock in its raised position when the knuckle is completely open, substantially as specified.

8. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, said knuckle-tail being provided with a ledge or shelf adapted to engage the lower end of said knuckle-thrower leg to support the lock in its raised position when the knuckle is completely open, and said ledge or shelf having an inclined upper face to adapt it to slip under the lower end of said knuckle-thrower leg as the knuckle swings open, substantially as specified.

9. In a car-coupler, the combination with the draw-head having a rear arm or tail furnished with a transversely-extending slot and with a cam or incline, and a lock having a leg fitting in said slot of the knuckle-tail and furnished with a foot or projection engaging said cam or incline on the knuckle-tail to throw the knuckle open when the lock is lifted, said knuckle-tail being provided with a ledge or shelf adapted to engage the lower end of said knuckle-thrower leg to support the lock in its raised position when the knuckle is completely open, said ledge or shelf having an inclined upper face to adapt it to slip under the lower end of said knuckle-thrower leg as the knuckle swings open, and the lower end of said knuckle-thrower leg being furnished with an inclined face, substantially as specified.

10. In a car-coupler, the combination with a forked draw-head, of a pivoted knuckle having a rear arm furnished with a slot, of a lock having a leg fitting in the slot in the rear arm of the knuckle, said rear arm of the knuckle and said leg of the lock having interengaging integral devices for throwing the knuckle open as the lock is lifted, and said rear arm of the knuckle having a shelf or device for supporting the lock by engagement with said leg when the knuckle is fully open, and said leg of the lock and the draw-head having interengaging parts to support the lock in position for uncoupling, substantially as specified.

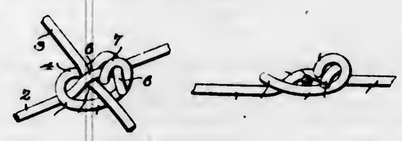
11. In a car-coupler, the combination with a forked draw-head, of a pivoted knuckle having a slotted rear arm or tail, of a lock having two legs, one of which passes through the slot in the knuckle-tail, substantially as specified.

12. In a car-coupler, the combination with a forked draw-head, of a pivoted knuckle having a slotted rear arm or tail, of a lock having two legs, one of which passes through the slot in the knuckle-tail, said lock and knuckle-tail having interengaging devices for throwing the knuckle open as the lock is lifted, substantially as specified.

13. In a car-coupler, the combination with a forked draw-head, of a pivoted knuckle having a slotted rear arm or tail, of a lock having two legs, one of which passes through the slot in the knuckle-tail, said knuckle-tail having a cam or incline, and the leg of the lock passing through the knuckle-tail having a foot or projection engaging said cam or incline to throw the knuckle open, said foot or projection also serving to prevent the lock being removed or lifted too high, substantially as specified.

14. In a car-coupler, the combination with a forked draw-head, of a pivoted knuckle having a slotted rear arm or tail, of a lock having two legs, one of which passes through the slot in the knuckle-tail, said knuckle-tail having a cam or incline, and the leg of the lock passing through the knuckle-tail having a foot or projection engaging said cam or incline to throw the knuckle open, said foot or projection also serving to prevent the lock being removed or lifted too high, said leg of the lock passing through the knuckle-tail also serving to connect the knuckle to the draw-head, substantially as specified.

812,928. WIRE LOCK. ALANSON M. KENNEY, Ann Arbor, Mich. Filed Apr. 17, 1905. Serial No. 256,000.



Claim.—1. The combination with crossed wires, of a substantially U-shaped lock straddling one of the wires and passing across the opposite side of the other wire, one end portion of the lock being passed across the first-mentioned wire, and the other extremity of the lock being hooked over the first-mentioned end of the lock.

2. The combination with crossed wires, of a substantially U-shaped lock straddling one of the wires and passing across the opposite side of the other wire, one end of the lock being passed across the first-mentioned wire and engaged with the opposite side of the lock, said opposite side of the lock lying wholly at one side of said other wire and being bent back across the first-mentioned end of the lock.

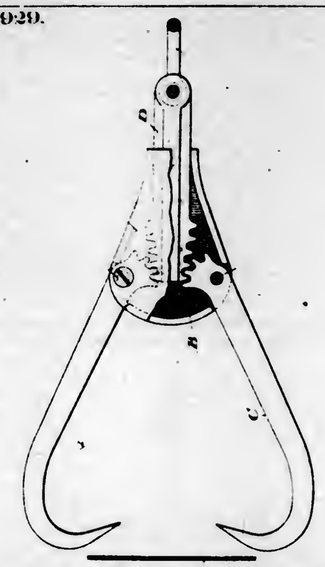
812,929. TONGS. GUSTAV KERSTEN, Crandon, Wis. Filed Dec. 14, 1905. Serial No. 291,677.

Claim.—1. The combination of a casing provided with side apertures, a pair of grippers that extend through said apertures of the casing and have spur-toothed sector ends eccentric on pivots within the casing, and a sliding draft-bar guided in said casing and having a tapered inner end provided with rack-teeth engaging the teeth of the sector ends of the grippers, the whole constituting tongs.

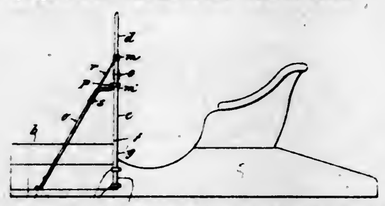
2. The combination of a separable casing provided with side apertures and having the sections thereof connected by bolts, a pair of grippers that extend through said apertures of the casing and have spur-toothed sector ends eccentric on said bolts, and a sliding draft-bar guided in said casing and having a tapered inner end provided with rack-teeth engaging the teeth of the sector ends of the grippers, the whole constituting tongs.

3. The combination with a casing provided with side apertures and a central inner groove longitudinally thereof, a pair of grippers that extend through said apertures of the casing and have spur-toothed sector ends eccentric on pivots within the casing, a sliding draft-bar having a tapered inner end provided with rack-teeth engaging the teeth of the sector ends of the grippers, and a rib on a side of the bar engaging the groove in the aforesaid casing, the whole constituting tongs.

812,929.



812,930. WIND-SHIELD FOR VEHICLES. GEORGE W. KIRK, Springfield, Mass. Filed Mar. 1, 1905. Serial No. 247,221.



Claim.—1. A wind-shield for vehicles comprising a lower part supported on the vehicle, a brace therefor extending from the upper part thereof to the vehicle, an upper part arranged to swing relatively to said lower part, and a brace pivotally secured to the upper part and having a sliding connection with the brace for the lower part.

2. A wind-shield for vehicles comprising a lower part supported on the vehicle, a brace therefor connected at its upper end to the top of the lower part and at its lower end to the vehicle, an upper part arranged to swing relatively to said lower part, and a brace connected at one end to the upper part and having its other end connected to the brace of the lower part.

3. A wind-shield for vehicles comprising a base-board secured to the vehicle, a lower shield part secured to said base-board, a brace for said lower part extending from the upper end thereof to the vehicle, an upper shield part arranged to swing relatively to said lower part, and a brace pivotally secured to the upper shield part and having a sliding connection with the brace for the lower shield part.

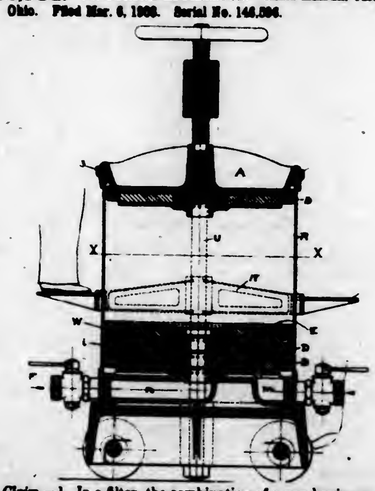
4. A wind-shield for vehicles comprising a base-board secured to the vehicle in a substantially vertical plane, a lower shield part resting upon the upper edge of said base-board, a brace for said lower shield part extending from near the upper end thereof to the vehicle, an upper shield part hinged to the upper edge of the lower shield part, and a brace pivotally secured at one end to the upper shield part and adjustably connected at its other end to the brace for the lower shield part, whereby the upper shield part may be swung toward and from a position of alinement with said lower shield part.

5. A two-part wind-shield for vehicles comprising a lower part supported on the vehicle in a substantially vertical plane, a brace therefor extending from the upper part thereof to the vehicle, an upper part hinged to the upper edge of said lower part to swing toward and from a position of alinement with said lower part and above the latter, a brace pivotally secured by one end to the swinging part of the shield, and having a sliding connection with the brace of said lower part and means to secure the braces together.

6. A two-part wind-shield for vehicles comprising a base-board rigidly secured to the vehicle in a substantially vertical plane, a lower shield part fixedly secured to the upper edge of said base-board, and an upper shield part movable relative to said lower part to a position above the latter and constituting an extension thereof, and means to secure said upper part in its adjusted position.

7. A wind-shield for vehicles comprising a base-board secured to the vehicle in a substantially vertical plane, a lower shield part resting upon the upper edge of said base-board, a rod extending along the opposite side edges of the base-board and lower shield part, a clip straddling the rod and the edge of the upper shield part to hold the rod against the edge of said part, a brace secured at one end to said clip and at its other end to the vehicle, an upper shield part arranged to swing relatively to said lower shield part, and means to brace and adjust said upper shield part, substantially as specified.

812,981. FILTERING APPARATUS. KARL KIEFER, Cincinnati, Ohio. Filed Mar. 6, 1903. Serial No. 146,596.



Claim.—1. In a filter, the combination of a pan having a plane imperforate bottom, of a single woven mat in contact on one side with said bottom, on the other side in contact with the filtering layer of compressed pulp.

2. In a filter, the combination with a pan having a plane imperforate bottom, of a single woven fiber-retaining mat, in contact on one side with said bottom, on the other side with the filtering layer of compressed pulp.

3. In a filter, in combination, a filter layer of compressed pulp contained within a circular pan, having ring-shaped surfaces protruding into said filter layer of a width at least equal to the thickness of the filter layer at the edge, said ring-shaped surfaces tightly connected to the inner side of the pan next to the clear-liquid conduit.

4. In a filter, a filtering layer within a pan, in combination only with a single woven fiber-retaining wire mat between filter layer and pan, with means of supplying cloudy liquid to the filtering layer.

5. In a filter, the combination of a filter layer within a circular pan, said pan having tightly connected to its inside ring-shaped surfaces higher than the bottom and projecting into the filter layers, in combination with means for supplying unfiltered liquid to the filter layers, said surfaces of a width at least equal to the thickness of the filter layer at the edge and conducting the filtered liquid away.

6. In a filter, the combination with a single woven mat in contact with a filtering layer on one side, on the other side with a plane imperforate surface, of means for circulating liquid through filter layer and mat.

7. In a filter, the combination with a single woven fiber-retaining mat in contact with a filtering layer on one side, on the other side a plane imperforate surface, of means for circulating liquid through filter layer and mat.

8. In a filter, the combination of a filtering layer of compressed pulp within a circular pan having ring-shaped surfaces higher than the bottom, and projecting into the filtering layers, in combination with a woven mat between filtering layer and bottom of pan, with means of supplying unfiltered liquid to the filter layer.

9. In a filter, the combination of a filtering layer of compressed pulp within a circular pan, the pan-like part of an equal thickness throughout except the central part, having ring-shaped surfaces higher than the bottom, and projecting into the filtering layers, in combination with a woven mat between filtering layer and bottom of pan, with means of supplying unfiltered liquid to the filter layers.

10. In a filter, the combination of a filtering layer of compressed pulp within a circular pan, the pan-like part of an equal thickness throughout, except the central part, horizontal ring-shaped surfaces projecting into the filtering layers, in combination with a woven mat between filtering layer and bottom of pan, with means of supplying unfiltered liquid to the filter layers.

11. In a filter, the combination of a filtering layer of compressed pulp within a circular pan, the pan-like part of an equal thickness throughout, except the central part, having an upturned edge and a metal hub and ring-shaped surfaces higher than the bottom and projecting into the filtering layers, in combination with a woven mat between filtering layer and bottom of pan, with means for supplying unfiltered liquid to the filtering layer.

12. In a filter, the combination of a filtering layer of compressed pulp within a circular pan having an upturned edge and cylindrical hub in center, smooth bottom and ring-shaped surfaces higher than the bottom and projecting into the filtering layers, in combination with a woven fiber-retaining mat between filtering layer and bottom of pan, with means of supplying unfiltered liquid to the filter layers.

13. In a filter, the combination of a filtering layer of compressed pulp, with a circular sheet-metal pan having an upturned edge and smooth bottom, and ring-shaped surfaces higher than the bottom and projecting into the filtering layers, in combination with a woven mat between filtering layer and bottom of pan, with means of supplying unfiltered liquid to the filter layer.

14. In a filter, the combination with a series of circular filter elements, of an external drum and of a cover partly projecting into the drum, said cover having a cylindrical part smaller than the drum and guided by the drum, and said cylindrical part of cover being of sufficient height to allow the use of the cover as means of compressing the filter elements.

15. The combination with a disk-shaped filtering layer of compressed pulp contained within a pan having a clear-liquid way in its bottom, of a smooth surface tightly attached to the pan outside of said clear-liquid way and in intimate contact with the edge of said filtering layer and parallel thereto, said smooth surface of a width at least equal to the thickness of the filter layer at the edge.

16. In a filter, the combination of a base with two uprights, of a sheet-metal drum with a cover, of a projecting-ring of greater strength than the sheet-metal drum and higher than the base, and adapted to protect the sheet-metal bottom from injury substantially as described.

17. In a filter, the combination of a base with two uprights, of a sheet-metal drum with a cover, of a protecting projection of greater strength than the sheet-metal drum and higher than the base, and adapted to protect the sheet-metal bottom from injury substantially as described.

18. In a filter, the combination of a base with two uprights, of a sheet-metal drum with a cover, of a protecting-ring of greater strength than the sheet-metal drum rigidly fastened to the uprights, higher than the base, and adapted to protect the sheet-metal body from injury.

19. In a filter, in combination, a filter layer of compressed pulp contained within a circular pan having ring-shaped surfaces in intimate contact with the edges of the filtering layer, said ring-shaped surfaces parallel to the filtering layer and of a width at least as wide as the thickness of the filtering layer at its edge.

20. The combination with a disk-shaped filtering layer of compressed pulp, of an imperforate metal surface separating it entirely from the neighboring filtering layer, of surfaces of intimate contact along the edges of said filtering layer between the filter layer and imperforate surfaces, said edges of contact of a width at least equal to the thickness of the filtering-surface at the point of contact and tightly attached to the said imperforate separating-surface.

21. The combination in a filter, of a pan having a vertical peripheral border, next to this border and tightly connected therewith a smooth ring-shaped surface at least as wide as the thickness of the filtering layer, a filter layer of compressed pulp within the pan in contact with said peripheral ring-shaped edge, but spaced apart elsewhere from the pan by means constituting a liquid-way, and of means to supply the liquid-way with liquid.

22. The combination in a filter, of a pan having a vertical central border, next to this border and tightly connected therewith a smooth ring-shaped surface at least as wide as the thickness of the filtering layer, a filter layer of compressed pulp within the pan in contact with said central ring-shaped edge, but spaced apart elsewhere from the pan by means constituting a liquid-way, and of means to supply the liquid-way with liquid.

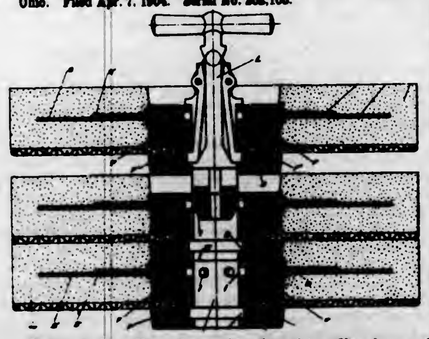
23. The combination in a filter, of a pan having a vertical peripheral border, and next to this border and tightly connected therewith, and parallel to the bottom of the pan, smooth ring-shaped surfaces of a width at least equal to the thickness of the filter layer at its edge, a filter layer of compressed pulp within the pan in contact with said ring-shaped edge, but spaced apart elsewhere from the pan by means of a liquid-conductor, of means pressing said filter layer at all times against smooth ring-shaped surfaces.

24. The combination in a filter, of a pan having a vertical peripheral border, and next to this border and tightly connected therewith, and parallel to the bottom of the pan, smooth ring-shaped surfaces of a width at least equal to the thickness of the filter layer at its edge, a filter layer of compressed pulp within the pan in contact with said ring-shaped edge, but spaced apart elsewhere from the pan by means of a wire-screen liquid-conductor, of means pressing said filter layer at all times against smooth ring-shaped surfaces.

25. The combination in a filter, of a pan having a vertical peripheral border, and next to this border and tightly connected therewith, and parallel to the bottom of the pan, smooth ring-shaped surfaces of a width at least equal to the thickness of the filter layer at its edge, a filter layer of compressed pulp within the pan in contact with said ring-shaped edge, but spaced apart elsewhere from the pan by means of an open-work liquid-conductor, of means pressing said filter layer at all times against said smooth ring-shaped surfaces.

26. The combination in a filter, of a pan having a vertical peripheral border, and next to this border and tightly connected therewith, and parallel to the bottom of the pan, smooth ring-shaped surfaces of a width at least equal to the thickness of the filter layer at its edge, a filter layer of compressed pulp within the pan in contact with said ring-shaped edge, but spaced apart elsewhere from the pan by means of an open-work liquid-conductor, of means pressing said filter layer at all times against said smooth ring-shaped surfaces consisting of wire screen pressed against by the neighboring filter element.

812,982. FILTERING ELEMENT. KARL KIEFER, Cincinnati, Ohio. Filed Apr. 7, 1904. Serial No. 202,105.



Claim.—1. In a filter, the combination of two filter layers of compressed pulp, interposed between them a circular inlet liquid-way with a central ring-shaped compression body having two horizontal compression-surfaces, whereby the filter layers where in contact therewith are more compressed than elsewhere, means for supplying unfiltered liquid to the inlet liquid-way and draining the filtered liquid from the filter layers.

2. In a filter a portable filter element consisting of a supporting circular inlet liquid-conductor having a central hub with central hole for the clear liquid, in combination with two filter layers of compressed fibrous pulp drained by a circular flat outlet liquid-conductor, said filter layers and liquid-conductor having central openings registering with the central hole of the supporting inlet liquid-conductor, and admitting of the introduction of means for taking hold of the supporting liquid-conductor.

3. In a filter an inlet liquid-conductor consisting of a single circular and stiff manufacture adapted to conduct liquid radially to two filter layers of compressed fibrous pulp in contact on both sides of said disk, and having a central compression body with impervious ring-shaped surfaces compressing the filter layers at their point of contact with said surfaces more densely than the rest of said filter layers.

4. In a filter, the combination of two filter layers of compressed pulp, interposed between them a circular inlet liquid-way with a central ring-shaped compression body having two horizontal compression-surfaces, whereby the filter layers where in contact therewith are practically compressed to non-porosity, means for supplying unfiltered liquid to the inlet liquid-way and draining the filtered liquid from the filter layers.

5. In a filter an inlet liquid-conductor supplying two filter layers and consisting of a single open-work disk with a ring-shaped compression body in its center, said compression body having horizontal ring-shaped faces, and vertical annulus, forming when superposed with the neighboring liquid-conductors, an intercommunicating opening for the clear liquid, in combination with filter layers of compressed fibrous pulp supplied by said inlet liquid-conductors, and with outlet liquid-conductors draining said filter layers from the clear liquid.

6. In a filter a portable filter element consisting of, two filter layers of fibrous compressed pulp, of an outlet liquid-conductor draining two filter layers, of an inlet liquid-conductor supporting the two filter layers and outlet liquid-conductor and being adapted to be taken hold of centrally for the purpose of inserting the whole element into the filter or extricating it therefrom, and of means to take hold of said liquid-conductor.

7. In a filter the combination with an inlet liquid-conductor supplying two filter layers, having a central compression body and a vertical central annulus, of filter layers of compressed fibrous pulp having depressions to correspond with the compression body mentioned, of an outlet liquid-conductor between two filter layers with a central opening to correspond and to center itself with the vertical annulus of the inlet liquid-conductor, and of means for supplying the inlet liquid-conductors with cloudy liquid and draining the outlet liquid-conductors.

8. In a filter the combination of a series of filter elements each consisting, of an inlet liquid-conductor (supplying two filter layers) of coarse-wire screen having a central compression body considerably thicker than said liquid-conductor and having a central opening for the clear liquid in said compression-body, of a pair of filter layers, the lower of which having a circular depression to correspond with the upper half of the compression body of the supporting inlet liquid-conductor, the upper filter layer having a similar depression to correspond with the lower half of the compression body of the neighboring inlet liquid-conductor, of an outlet liquid-conductor between the two filter layers with outlet facilities between two compression bodies of neighboring inlet liquid-conductors and connecting with the central intercommunicating opening formed by all compression bodies, and with means for supplying the inlet liquid-conductors with cloudy liquid and draining the outlet liquid-conductors.

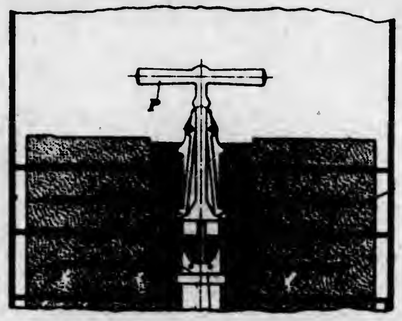
9. In a filter the combination of a series of filter elements each consisting, of an inlet liquid-conductor (supplying two filter layers) of a single open-work manufacture having a central compression body with a central opening for the clear liquid, of a pair of filter layers, the lower of which having a circular depression to correspond with the upper half of the compression body of the supporting inlet liquid-conductor, the upper filter layer having a similar depression to correspond with the lower half of the compression body of the neighboring inlet liquid-conductor, of an outlet liquid-conductor between the two filter layers with outlet facilities between two compression bodies of neighboring inlet liquid-conductors and connecting with the central intercommunicating openings formed by all compression bodies, and with means for supplying the inlet liquid-conductors with cloudy liquid and draining the outlet liquid-conductors.

10. In a filter, the combination of two filter layers of compressed pulp, a circular inlet liquid-way interposed between them with an annular ring-shaped compression body having two compression-surfaces, whereby the filter layers where in contact therewith are more compressed than elsewhere, means for supplying unfiltered liquid to the inlet liquid-way and draining the filtered liquid from the filter layers.

11. In a filter, the combination of two filter layers of compressed fibrous pulp, of a circular inlet liquid-conductor, of rigid manufacture, interposed between and supplying them, a central compression body with impervious ring-shaped surfaces connected with said liquid-conductor and serving to compress the filter layers at their point of contact with said surfaces more densely than elsewhere.

12. In a filter, the combination with an inlet liquid-conductor, supplying two filter layers, a central compression body and vertical central annulus, of filter layers of compressed fibrous pulp, parts of which filter layers are in intimate contact with the compression body mentioned, of an outlet liquid-conductor, between and draining two filter layers, said liquid-conductor having a central opening to correspond and to center itself with the vertical annulus of the inlet liquid-conductor, and of means for supplying the inlet liquid-conductors with cloudy liquid and draining the outlet liquid-conductors.

812,933. FILTER. KARL KIEFER, Cincinnati, Ohio. Filed June 30, 1904. Serial No. 214,728.



Claim.—1. In a filter, the combination of a base, a drum rigidly connected to said base, of upright posts fastened onto said base and carrying a packing arrangement and a closing arrangement for the drum, each arrangement adapted to swing out of the way of the other during its use.

2. In a filter, the combination of filter elements built up in the filter, forming a continuous filter layer, means for forming said filter layers and means for removing said filter layers in pairs.

3. In a filter, the combination of an external drum, a series of filter elements connected with each other so as to form one continuous filter mass, and more compressed in the center, with inlet and outlet liquid-conductors.

4. In a filter, the combination of a drum and two upright posts connected to said drum, of a yoke for the purpose of holding down the cover, hinged to one post and locking into the other one, of a press arrangement for the pressing of the filter layer, hinged to the latter post and locking into the previous post, each, yoke and press arrangement, adapted to swing aside during the use of the other one.

5. In a filter, the combination of a drum, of a press arrangement for the purpose of producing a series of filter elements, constituting one continuous filter layer, with a central space-former of a height only part of that of the drum and adapted to be raised as the filter elements are built up and finally extricated.

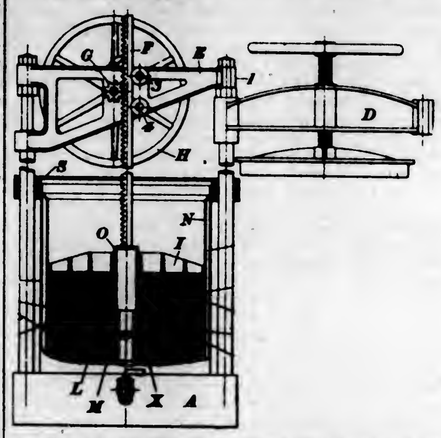
6. In a filter, the combination of a rigid base, two posts fastened onto such base, a drum mounted upon the base, of a yoke and cover arrangement hinged vertically to one post and locking into the other one, of a press arrangement hinged vertically to the latter post and locking into the previous post, each arrangement adapted to swing aside during the use of the other one.

7. In a filter, the combination of a series of filter layers, interleased in annular areas and separated outside of each area by liquid-conductors consisting each of one coarse screen and one fine screen, said coarse screen in contact with the lower filter layer, and means for supplying and draining said liquid-conductors.

8. In a filter, the combination of a casing, a series of filter elements interleased among each other in annular areas, and separated outside of such area by inlet and outlet liquid-conductors, one of the series of conductors communicating with the central opening formed by the said filter layers, and adapted to be gripped by a lifting instrument from above.

9. In a filter, the combination of two filter layers interleased in an annular area and separated outside of such area by a liquid-conductor, consisting of a metal non-fiber-retaining open-work flat disk and a single metal fiber-retaining screen, the latter in contact with the upper filter layer and the former in contact with the lower filter layer, both metal constructions touching each other, with means of supplying and draining said filter layers.

812,934. FILTER. KARL KIEFER, Cincinnati, Ohio. Filed Nov. 21, 1904. Serial No. 233,067.



Claim.—1. In a filter, the combination of a series of filter layers interposed between which are liquid-conductors consisting of woven screens having a wire edge soldered on them.

2. In a filter of the class described, a liquid-conductor consisting of woven-wire screens and having a meander-wire edge.

3. In a filter, the combination of a series of filter layers, interposed between them liquid-conductors, consisting of woven screens, having a wire band at their edge to protect them, and spacing the filter layers apart at their edge, at the same time admitting liquid to the liquid-conductors.

4. In a filter, the combination of a series of filter layers of compressed pulp, an exterior drum, a base and two columns, a pressing device consisting of a single hollow tube in the center, attached to which is a rack, in combination with a gear and hand-wheel.

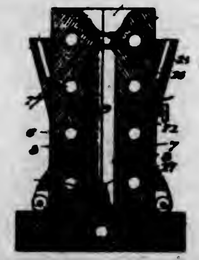
5. In a filter, the combination of a disk-shaped filter layer of compressed fibrous pulp, the center of which contains more fibers compressed to the same thickness as the rest of the disk, with means for supplying and draining said filter layer.

6. In a filter, the combination of a disk-shaped filter layer of compressed fibrous pulp, the center part of which is under greater compression and contains proportionately more filter mass than the rest of the disk, with means for supplying and draining said filter layer.

7. In a filter the combination of a drum or casing, of a series of filter elements contained within said drum, of a press arrangement for producing the filter elements within said casing, and of means attached to said press arrangement for extracting the filter layers after use.

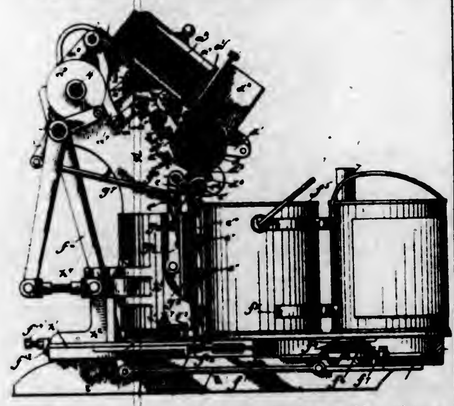
8. In a filter, in combination with filter layers, a wire screen having a meander-wire edge.

812,935. MOLD FOR CASTING CENTER-HUNG SASH-WEIGHTS. LOUIS H. KNAPP, Parkersburg, W. Va. Filed Mar. 26, 1905. Serial No. 252,695.



Claim.—In a mold, a stationary mold-section provided with a vertically-disposed eye-forming core and defining a smooth unobstructed bearing-surface on each side of the core, a pair of movable mold-sections slidably mounted on the bearing-surface of the stationary section and each provided with a vertical recess adapted to register with the recess in the adjacent section when said sections are in closed position, said stationary mold-section being of sufficient width to form a support for the movable sections when in both open and closed positions, a core projecting inwardly from one of the movable sections for engagement with the eye-forming core, longitudinally-disposed lugs formed integral with the movable sections and provided with inclined recesses adapted to receive an operating-tool for adjusting the movable sections to open and closed positions, spaced ears projecting laterally from the base of each movable section and disposed in alinement with the lugs, rollers journaled in said ears and adapted to engage the smooth bearing-surface of the stationary mold-section, and means for clamping the mold-sections in closed position, there being a passage formed in the stationary section beneath the eye-forming core to permit the circulation of a cooling medium and a plurality of passages formed in the movable sections and opening at each end through the side walls of said sections.

812,936. LABELING-MACHINE. DANIEL W. KNEELY, Dayton, Ohio, assignor, by direct and mesne assignments, to The Drury-Kneely Manufacturing Company, Dayton, Ohio, a Corporation of Ohio. Filed Sept. 2, 1904. Serial No. 223,166.



Claim.—1. The combination, in a labeling-machine, of means for supporting labels, devices for feeding same, supporting devices for the article to be labeled, means for giving a partial attachment of the label to the article to be labeled, and additional devices, shaped to conform to the contour of said article, to engage said label at or near the point of first attachment and stretch same about said article and then apply pressure to substantially all parts of said label, substantially as and for the purpose specified.

2. In a labeling-machine, the combination of feeding devices for labels and pasting devices therefor, means for holding the labels in proper position for applying same to the article to be labeled, and, while said label is being held in proper position, means for finishing the application of said label to the article to be labeled, and means for throwing out of operative position the holding devices for said label simultaneously with the final applying of the label to the article.

3. The combination, in a labeling-machine, of means for supporting labels, devices for feeding same, supporting devices for the article to be labeled, means for giving a partial attachment of the label to the article to be labeled, and devices adapted for stretching said label and at the end of its movement for pressing all parts of said label to said article, substantially as specified.

4. The combination, in a labeling-machine, of means for supporting labels, devices for feeding same, supporting devices for the article to be labeled, means for giving a partial attachment of the center of the label to the article to be labeled, and a pivoted device on each side of the center of said label shaped to conform to the contour of said article adapted to stretch and apply the free ends of said label to said article, substantially as specified.

5. In a labeling-machine, a supporting device for the labels, a buckling device, means for operating each of said devices, means for causing the supporting device to have two complete operations during the time said buckling device is given one complete operation, and pasting and applying devices, for the purpose specified.

6. In a labeling-machine, the combination of a main operating device, a movable support for the labels, a support for the articles to be labeled, a device coöperating with said label-support to effect the disengagement of one of the labels from said support by the movement of said support, feeding devices normally out of engaging position, and means for throwing said feeding devices into position for engaging the end of said labels, substantially as specified.

7. The combination of a supporting device with a buckling device, a main operating device for both of said devices, feeding-rolls located in proximity to said buckling device, one of said rolls being normally out of engaging position, a ratchet-and-pawl connection between said last-mentioned feeding-roll and the main operating device, and controlling means for connecting said ratchet-and-pawl connection for throwing the feeding-roll into engaging position, and means for pasting and applying the label after same has been fed by said feeding-rolls.

8. The combination of a supporting device, a buckling device, and a main operating device for each of said devices, feeding-rolls, one out of engaging position, a ratchet-and-pawl connection between said last-mentioned feeding-roll and said main operating device, a plurality of springs connected with said pawl, and a controlling device adapted to contact against one of said springs for disconnecting said pawl-and-ratchet mechanism, and pasting and applying devices for said labels after same have been fed by said feeding-rolls.

9. The combination of a supporting device, a buckling device, feed-rolls, a main operating device for said devices, a pasting-roll, additional feeding devices consisting of grooved rolls and rotating disks, and applying mechanism, for the purpose specified.

10. The combination of a supporting device, a buckling device, feeding-rolls, a main operating device for said devices, a pasting-roll, a plurality of fingers located in proximity to said paste-roll, two of said fingers having their ends approaching each other, and applying devices, for the purpose specified.

11. The combination of feeding devices, pasting devices, additional feeding devices comprising an endless band and a plurality of movable rolls, and means for limiting the pressure with which said rolls bear against said band, and applying devices, for the purpose specified.

12. The combination of feeding devices, pasting devices, additional feeding devices comprising an endless band and a plurality of spring-pressed movable rolls, and means for limiting the pressure with which said rolls bear against said band, and applying devices, for the purpose specified.

13. The combination of feeding devices for labels, supplemental feeding devices, applying devices consisting of a bar covered with resilient material, and a plurality of wings also covered with resilient material one located on each side of said bar, and means for operating said applying devices, for the purpose specified.

14. The combination of means for feeding labels, means for feeding the articles to be labeled to applying position, means for yieldingly pressing one part of said label to the article, and means for stretching the ends of said label and simultaneously pressing the entire label to said article.

15. In a labeling-machine, the combination of feeding devices for the labels and pasting devices therefor, means for holding the label in its proper position for applying same to the article to be labeled and means for pressing the ends of said label against the article to be labeled, and spring-pressed brake devices for regulating the pressure against the labels, substantially as specified.

16. In a labeling-machine, a revoluble article-carrying table, movable label-support, label-pasting devices, label-pressing devices, a label-buckling device, and intermittent impinging label-feeding rolls, substantially as specified.

17. In a labeling-machine, an article-carrying table, label-pasting devices, label-pressing devices, a movable label-support, a buckling device coöperating with said movable support to buckle the lowermost label, and label-feeding rolls, substantially as specified.

18. In a labeling-machine, an article-supporting table, label-pasting devices, label-pressing devices, means for supporting the supply of labels at two opposite sides, means for disengaging the lowermost label at its forward side, and label-feeding rolls, substantially as specified.

19. In a labeling-machine, article-feeding means, label-feeding devices, label-pasting devices, label stretching and pressing devices, means for actuating said devices comprising a cam-shaft and a series of cams thereon, driving mechanism, means for engaging said driving mechanism and cam-shaft and means for automatically discon-

gaging said driving mechanism and cam-shaft at the completion of the operation, substantially as specified.

20. In a labeling-machine, article-feeding mechanism, label-pasting mechanism, label-pressing mechanism, a label-support, means for withdrawing the forward edge of the lowermost label from said support, feed-rolls, and means for retaining the pasted label in an upright position until applied to the article, substantially as specified.

21. In a machine as described, the combination with label-feeding devices, label-applying devices, of a supporting-frame, a roller mounted in said frame, actuating means for said roller, a paste-inclosure surmounting said roller, and adjusting means for varying the relation of said inclosure and roller, whereby the thickness of the film of paste carried by said roller from said inclosure may be regulated, substantially as specified.

22. In a machine as described, the combination with label-feeding devices, article-supporting devices, and label-applying devices, of a paste-inclosure, a movable bottom for said paste-inclosure, and means for adjusting the relation of said inclosure and movable bottom, whereby the thickness of the film of paste discharged from said inclosure may be regulated, substantially as specified.

23. In a machine as described, article-supporting devices, label-feeding devices, and label-applying devices, label-pasting devices, feeding devices for the pasted labels comprising a roll having a series of offsets thereon, a shaft carrying a series of disks registering with the offsets of said roll, endless carrier-belts, supporting-rolls coöperating therewith, substantially as and for the purpose specified.

24. In a machine as described, article-supporting devices, label-feeding devices, label pasting and applying devices, means for advancing the pasted label comprising an endless belt, rollers of comparatively narrow face coöperating with said belt, an adjustable stop for the pasted label, and means for moving said rollers from contact with the pasted label, substantially as specified.

25. In a machine as described, article-supporting devices, label-feeding devices, label-pasting and label-applying devices, advancing mechanism for the pasted label comprising endless belts engaging the face of said label, a series of rollers engaging the pasted side of said label, a supporting-frame for said rollers, an adjustable stop for said pasted label, and means for releasing the pasted label from said belts and rollers, substantially as specified.

26. In a machine as described, the combination with label-feeding, article-supporting, label-pasting and label-applying devices, of feed-rolls for the pasted labels comprising a roller having a series of offsets thereon and a roller composed of a series of comparatively narrow-faced members registering with the offsets of the first-named roller, substantially as specified.

27. In a machine as described, the combination with label-feeding, article-supporting, label-pasting and label-applying devices, of advancing devices for the pasted label comprising an endless belt, a series of rollers normally in contact with said belt, a hinged supporting-frame for said rollers, an adjustable stop for the pasted label, and means to move said supporting-frame on its hinged connection, substantially as specified.

28. In a machine as described, article-supporting, label-feeding, and label-pasting devices, of a preliminary pressure member, a reciprocating member, hinged wing members on said reciprocating member adapted to be moved about their hinged connection by contact with the article to be labeled, and tenacious material on said wing members, substantially as specified.

29. In a machine as described, article-supporting mechanism, label-feeding and label-pasting devices, a preliminary pressure member, a reciprocating member, hinged wing members on said reciprocating member, means for pressing said wing members into contact with the article to be labeled, means for turning said hinged wing members toward each other upon the retraction of said reciprocating member, substantially as specified.

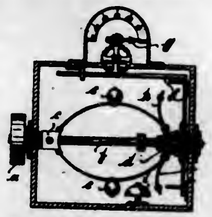
30. In a machine as described, article-supporting mechanism, label feeding and pasting devices, label stretching and pressure devices comprising a reciprocating member, wing members hinged thereto whose forward edges are normally separated by a distance less than the cord of the surface-segment to which the label is applied, but whose forward edges are adapted to be spread by contact with the article to be labeled, the inner surface of said wing members being so shaped as to conform to the surface of the article to be labeled, and at the forward limit of their stroke to simultaneously press all parts of said label, substantially as specified.

31. In a machine as described, article-supporting, label-feeding, and label-pasting devices, a pivoted spring-pressed pressure member, a reciprocating member, wing members carried thereby and so shaped as to conform to the segment of the article to be labeled, means for operating said reciprocating member to simultaneously press all parts of the label after same has been preliminarily applied by said pressure member.

32. In a machine as described, article-supporting, label-feeding, and label-pasting devices, a preliminary pressure member, a reciprocating member, engaging surfaces on said reciprocating member, means for moving said surfaces laterally for the purpose of stretching the label at the end of the movement of the reciprocating member, said engaging surfaces being so shaped as to conform to the surface-segment of the article to be labeled at the limit of their movement for the purpose specified.

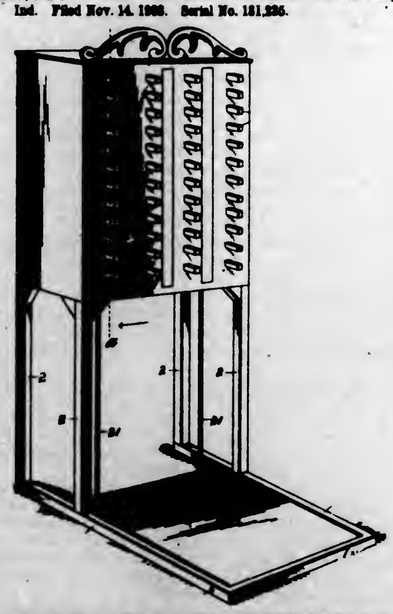
33. In a machine as described, movable article-supporting, label-feeding, and label-pasting devices, a reciprocating member, a lock for said article-supporting devices, and means for releasing said lock by the reciprocating member, for the purpose specified.

812,937. TACHOMETER OR SPEED-INDICATOR. VINZENZ KOSLITSCH, Salmthal, Austria-Hungary. Filed June 14, 1904. Serial No. 213,510.



Claim.—In a speed-indicator, in combination, a rotatable shaft, a stationary sleeve secured to it, and a second sleeve sliding on it, bowed springs carrying centrifugal weights uniting the two sleeves, an angular rack carried by the sliding sleeve, indicating mechanism actuated by the said rack, clappers projecting from the sliding sleeve, and a gong rotated within range of the same, substantially as described.

812,938. VOTING-MACHINE. STEPHEN D. LATTON, Westport, Ind. Filed Nov. 14, 1903. Serial No. 181,236.



Claim 1. The combination with straight-ticket and individual keys arranged in rows, and registering mechanism, of a frame comprising a plurality of imperforate strips corresponding in number

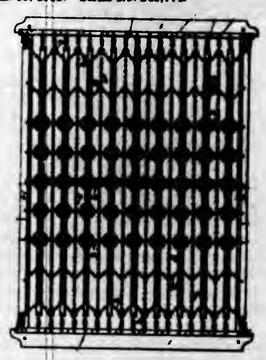
to the rows of keys, and a member connected rigidly to the end of the strips, disposed in the path of the straight-ticket keys and provided with openings, each of which is normally disposed to one side of one straight-ticket key, said straight-ticket keys being adapted to pass through said openings to move the frame and engage the registering mechanism.

2. The combination with the keys arranged in rows and provided with notches, of a frame comprising strips corresponding in number to the rows and each carrying a plurality of springs, a platform, connections between the platform and the frame for moving the frame into a position that when the keys are pressed the springs will enter the locking-notches.

3. The combination with a plurality of rows of keys, each key being provided with notches, V-shaped springs bearing between adjacent keys of adjacent rows, a lateral projection on each key for engagement with one leaf of a spring, while the other leaf engages in one of the notches in the same key and the point of the spring fits in an adjacent key of an adjacent row.

4. The combination with the keys, of a frame, independently-movable spring-locks for the keys mounted on the frame, and mechanism for moving the frame to move the spring-locks to and from a position where they will be engaged by the keys.

812,939. BED-SPRING. BENJAMIN F. LUDLOW, Mansfield, Ohio. Filed Jan. 19, 1905. Serial No. 241,774.



Claim.—1. In a bed-spring the combination of a frame having a series of bars suspended from end pieces, a series of conical springs mounted on said bars, coil-springs securely attached to the end pieces, chains connected to said springs substantially as and for the purpose described.

2. In a bed-spring composed of a frame having suitable bars suspended therefrom, a series of coiled springs attached to said frame, chains attached to said coiled springs through the medium of suitable rings a series of short sections of chain connecting the top of the conical springs at points diametrically opposed to each other with the ends of said sections secured to suitable side bars.

3. The combination of a frame having depending tubular side rails, with end pieces having their corners notched and adapted to fit the end and side rails of the bed, side bars connected to the end pieces under tension through the medium of coiled springs.

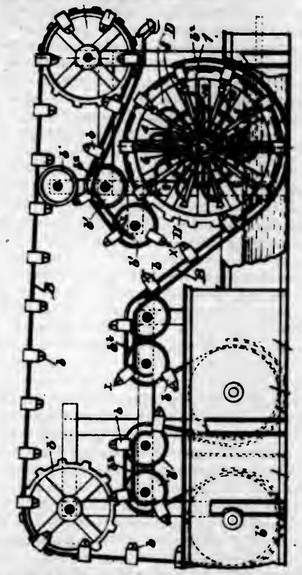
4. In a bed-spring composed of a frame having suitable bars attached thereto and projecting inwardly with apertures provided therein and adapted to receive the looped end of the coiled springs, rings attached to the opposite looped ends of the coiled springs, chains connected thereto and adapted to form part of the surface of the bed-springs, said chains and springs being adapted to maintain a predetermined weight, a series of bars suspended from the end pieces and supported by coiled springs attached thereto, a series of conical springs adapted to be supported vertically from said bars whereby additional weight is sustained without affecting the elasticity of the bed-spring.

5. In a bed-spring the combination of a frame having a series of coiled springs attached horizontally to the end pieces thereof, said springs supporting a series of bars, a series of conical springs mounted thereon, a linked brace connecting said bars together whereby said springs are kept in proper alinement permitting independent movement substantially as and for the purpose described.

6. In a bed-spring the combination of a frame having a series of horizontal coiled springs attached thereto, a series of bars suspended from said frame, chains supported by said coiled springs, a series of conical springs supported by said bars, side bars attached to the end piece of the frame under tension and adapted to prevent lateral motion, chains attached to alternate coiled springs forming a part of the surface of the bed-spring.

7. In a bed-spring the combination of a frame having a series of coiled springs attached thereto, a series of bars suspended therefrom, conical springs supported by said bars, chains secured to said coiled springs, side bars secured to sections of said chains in such a manner as to give free and independent movement to all parts substantially as and for the purpose described.

812,940. BOTTLE-RINSER. CHARLES H. LOEW, Lakewood, Ohio. Filed Mar. 17, 1904. Serial No. 198,613.



Claim.—1. A bottle-rinsing mechanism comprising a reciprocatory fluid-discharge stem, and means whereby said stem is advanced and retracted by the pressure of the rinsing fluid.

2. A bottle-cleaning apparatus comprising fluid-supply means and a bottle-holder, one of which is rotatable relatively to the other, a tube, a fluid-discharge stem mounted in said tube and having means by which it is reciprocated by the pressure of the fluid and means by which the supply of said fluid to said tube is controlled by the rotation of the rotatable part.

3. A bottle-cleaning apparatus comprising fluid-supply means and a bottle-holder one of which is movable relatively to the other, a discharge-stem having a head and means by which the fluid is conducted alternately to opposite sides of said head at predetermined places in the movement of the movable part, said stem being arranged in a portion of the conducting means.

4. A bottle-rinsing mechanism comprising supply and drainage means for the rinsing fluid, a reciprocatory discharge-stem having a head or piston, a tube in which the same reciprocates and means for establishing communication of the portion of the tube at one side of the piston with said supply means and of the portion thereof at the other side of said piston with the drainage means, to thereby force the piston and stem in one direction, and for reversing said communication, to cause the rinsing fluid to reverse the direction of movement of said piston and stem.

5. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture, bottle-carrying means movable relatively to said aperture, a tube movable with said carrying means, a fluid-discharge stem reciprocatorily mounted in said tube and provided with a head or piston, and means through which said tube has communication with said aperture alternately above and below said piston.

6. A bottle-rinsing mechanism comprising a fluid-supply pipe

812,941. RAILWAY-SIGNAL. [illegible] Lone South Omaha

6. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture and drainage-groove, bottle-carrying means movable relatively to said pipe, a tube movable with said carrying means and provided with a reciprocatory piston and means through which the portions of said tube, above and below said piston, each alternately communicates with said discharge-aperture and drainage-groove.

7. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture and a drainage-groove and a rinsing-wheel mounted to rotate around said pipe with the bottles being rinsed, and comprising a fluid-discharge stem provided with a head or piston, a tube in which said stem and head or piston reciprocate, and means through which the portions of said tube above and below said piston each alternately communicate with said discharge-aperture and drainage-groove.

8. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture and a drainage-groove, and a rinsing-wheel mounted to rotate around said pipe with the bottles being rinsed, and comprising a fluid-discharge stem provided with a head or piston, a tube in which said stem and head or piston reciprocate, said tube having an open lower end alternately communicating with said discharge-aperture and drainage-groove and a separate tube entering the first-mentioned tube above said piston or head and having an open lower end alternately communicating with said discharge-aperture and drainage-groove.

9. A bottle-rinsing mechanism, comprising a fluid-supply pipe having a discharge-aperture and a drainage-groove and a rinsing-wheel mounted to rotate around said pipe and comprising a hub having a series of pairs of apertures, each of which apertures alternately registers with said discharge-aperture and drainage-groove, a plurality of tubes radiating from said hub and provided with open lower ends communicating with one of said apertures of the respective pairs and having at the outer end cups to engage the bottle-necks, a fluid-discharge stem mounted to reciprocate in each of said tubes and provided with a head or piston, and a plurality of tubes carried by said hub and extending from the other apertures of the respective pairs and each opening into one of said first-mentioned tubes above said piston.

10. A bottle-cleaning means, comprising a reciprocatory fluid-discharge stem, means for causing said stem to be advanced and retracted by the pressure of the rinsing fluid, and means for causing said stem to rotate during its reciprocation.

11. A bottle-cleansing means comprising a fluid-discharge stem having a head or piston, means in which the same is reciprocatorily mounted, a brush carried by said stem, means for admitting the rinsing fluid under pressure to the interior of the first-mentioned means alternately at the upper and lower side of said piston and means for causing said stem to rotate during its reciprocations.

12. A bottle-cleansing means comprising a hollow fluid-discharge stem, having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, and means for admitting fluid under pressure to said tube alternately at opposite sides of said piston to thereby reciprocate said stem.

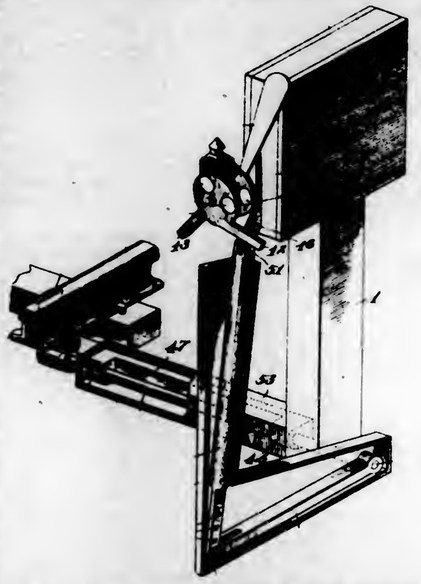
13. A bottle-cleansing means comprising a hollow fluid-discharge stem having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, means for admitting fluid under pressure to said tube alternately at opposite sides of said piston to thereby reciprocate said stem and means for causing said stem to rotate during its reciprocations.

14. A bottle-cleansing means comprising a hollow fluid-discharge stem having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, means for admitting fluid under pressure to said tube alternately at opposite sides of said piston to thereby reciprocate said stem, and brushing means carried by said stem.

15. A bottle-cleansing means comprising a hollow fluid-discharge stem having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, means for admitting fluid under pressure to said tube alternately at opposite sides of said piston, to thereby reciprocate said stem, brushing means carried by said stem, and means for causing said stem to rotate during its reciprocations.

16. A bottle-rinsing mechanism, comprising a fluid-supply pipe having a discharge-aperture, and means revolubly mounted on said pipe, said revolubly-mounted means being provided with a fluid-discharge stem having a head or piston, a tube in which said stem works, means through which communication of the said aperture with the interior of said tube and below said piston or head is alternately established, and means for turning said stem in said tube during its reciprocations.

812,941. RAILWAY-SIGNAL. WESLEY LOCK, South Omaha, Nebr., assignor, by direct and mesne assignments, of one-half to Emanuel V. Lorig and one-fourth to William C. Lambert, all of South Omaha, Nebr. Filed Apr. 7, 1905. Serial No. 254,300.



Claim.—1. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; and means for pivotally moving said signal-arm comprising a pivoted operating-arm, a pivoted arm adapted to be moved upon the passage of a car, and a weighted connecting-rod extending between said last-mentioned arm and said operating-arm.

2. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm; a pivoted lever adapted to engage said fingers for moving said arm; a car-operated device for moving said lever in one direction; and a weight adapted to move said lever in the opposite direction.

3. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm and spaced apart; a pivoted lever extending between said fingers for moving said arm; means for moving said lever in one direction; and means for moving said lever in the opposite direction.

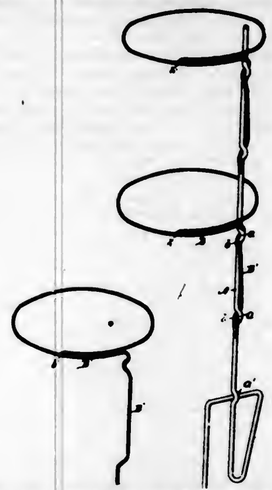
4. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; means for pivotally moving said signal-arm comprising a pivoted operating-arm, a pivoted arm adapted to be moved upon the passage of a car, and a weighted connecting-rod extending between said last-mentioned arm and said operating-arm; and an escapement for controlling the gravity movement of said weighted rod.

5. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm; a pivoted lever adapted to engage said fingers for moving said arm; a car-operated device for moving said lever in one direction; a weight adapted to move said lever in the opposite direction; and an escapement for controlling the gravity movement of said weight.

6. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm and spaced apart; a pivoted lever extending between said fingers for moving said arm; car-operated means for moving said lever in one direction; a weight for moving said lever in the opposite direction; and an escapement for controlling the gravity movement of said weight.

812,942. PLANT-SUPPORT. CHRISTIAN LUND, Wausau, Wis. Filed June 17, 1905. Serial No. 265,730.

Claim.—1. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, the upright portions of said stake having an offset to receive the transverse portion of the base thereof; and a plant-engaging loop formed of a single piece of wire having a free outturned end and a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.



2. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downward, and a plant-engaging loop formed of a single piece of wire having a free outturned end and a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

3. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, the upright portions of said stake having an offset to receive the transverse portion of the base thereof; and a plant-engaging loop formed of a single piece of wire having a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

4. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, and a plant-engaging loop formed of a single piece of wire having a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

5. In a plant-support, the combination of a stake formed of wire having offsets at spaced intervals; and a plant-engaging loop formed of a single piece of wire having a free end and a stake-engaging arm with bends therein, spaced to correspond with said offsets in said stake, for the purpose specified.

6. In a plant-support, the combination of a stake formed of wire having offsets at spaced intervals; and a plant-engaging loop formed of a single piece of wire having a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

7. A plant-supporting stake formed of a single piece of wire, having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, the upright portions of said stake having an offset to receive the transverse portion of the base thereof, as specified.

8. A plant-supporting stake formed of a single piece of wire, having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, as specified.

812,943. ANNEALING-BOX. JOHN J. MARENY, Anderson, Ind. Filed Oct. 23, 1903. Serial No. 178,033.

Claim.—1. An annealing-box provided with an arch in the interior thereof, supports for the arch, and a box-top on the arch unattached thereto and attached to the body of the box.

2. An annealing-box including sides and ends, and a crowning or arched top part on the sides and ends attached thereto and provided with a tie-rod attached to the top part and also to the sides.

3. An annealing-box having a top provided with a supporting-arch unattached thereto and free to expand longitudinally in the box, the arch being normally in contact with the box-top, a tie-rod attached to the sides of the box and extending across the interior of the box at the upper portion thereof, and supports for the arch.

4. An annealing-box having a top provided with a supporting-arch unattached thereto and comprising a main member and also a pair of side members secured to the main member and having each a lateral flange, supports for the arch, and a tie-rod extending across the interior of the box and having the ends thereof welded to the sides of the box.

5. An annealing-box having a crowning-top and provided with a pair of posts in the interior thereof, means for connecting the posts with the sides of the box, a tie-rod extending across the interior of the box and welded to the sides thereof, and an arch resting upon the pair of posts and normally in contact with the top of the box but unattached thereto.

6. An annealing-box having a crowning-top and provided with a pair of posts in the interior thereof, means for connecting the posts with the sides of the box, a tie-rod extending across the interior of the box and attached to the sides thereof, the tie-rod having heads hidden in the side walls, an arch resting on the pair of posts and normally in contact with the top of the box but unattached thereto, and a tie-bar attached to the ends of the arch.

7. An annealing-box including sides and ends, a tie-rod welded to the sides of the box, and a top part on the sides and ends of the box and having flanges welded to the tie-rod.

8. In an annealing-box, the combination with the sides thereof having a frame connected to the bottom thereof, and with angle-irons secured to the inner sides of the box sides, of a pair of posts extending substantially from the frame between pairs of the angle-irons and secured thereto, the tops of the posts being below the plane of the tops of the angle-irons, an arch resting upon the tops of the posts between angle-irons, and a tie-rod attached to the sides of the box, the box having a top supported by the arch but unattached thereto.

9. In an annealing-box, the combination with the sides and the top thereof, of posts supported in the box against the sides thereof, an arch mounted on the posts and extending under the top of the box but unattached thereto, and guide-studs attached to the top of the box and projecting at opposite sides of the arch.

10. In an annealing-box, the combination of two side parts and a crowning or arched top part and also a tie-rod therefor, all welded together, an arch for supporting the top part, supports for the arch connected with the side parts, and end parts attached to the side parts and the top part.

11. In an annealing-box, the combination of two side parts and connected end parts, a tie-rod extending through the side parts, a crowning or arched top part on the side parts and end parts, and having flanges extending over the ends of the tie-rods, an arch for supporting the top part, supports for the arch, and lateral supports for the arch.

812,944. FEED-WATER HEATER. HENRY G. MILLER, Cleveland, Ohio, assignor to The Low Supply & Manufacturing Company, Concord, N. J., a Corporation of New Jersey. Filed May 24, 1905. Serial No. 262,609.

Claim.—1. An apparatus of the kind described, comprising a chamber, tubes arranged in said chamber and open to permit of the

6. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture and drainage-groove, bottle-carrying means movable relatively to said pipe, a tube movable with said carrying means and provided with a reciprocatory piston and means through which the portions of said tube, above and below said piston, each alternately communicates with said discharge-aperture and drainage-groove.

7. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture and a drainage-groove and a rinsing-wheel mounted to rotate around said pipe with the bottles being rinsed, and comprising a fluid-discharge stem provided with a head or piston, a tube in which said stem and head or piston reciprocate, and means through which the portions of said tube above and below said piston each alternately communicate with said discharge-aperture and drainage-groove.

8. A bottle-rinsing mechanism comprising a fluid-supply pipe having a discharge-aperture and a drainage-groove, and a rinsing-wheel mounted to rotate around said pipe with the bottles being rinsed, and comprising a fluid-discharge stem provided with a head or piston, a tube in which said stem and head or piston reciprocate, said tube having an open lower end alternately communicating with said discharge-aperture and drainage-groove and a separate tube entering the first-mentioned tube above said piston or head and having an open lower end alternately communicating with said discharge-aperture and drainage-groove.

9. A bottle-rinsing mechanism, comprising a fluid-supply pipe having a discharge-aperture and a drainage-groove and a rinsing-wheel mounted to rotate around said pipe and comprising a hub having a series of pairs of apertures, each of which apertures alternately registers with said discharge-aperture and drainage-groove, a plurality of tubes radiating from said hub and provided with open lower ends communicating with one of said apertures of the respective pairs and having at the outer end cups to engage the bottle-necks, a fluid-discharge stem mounted to reciprocate in each of said tubes and provided with a head or piston, and a plurality of tubes carried by said hub and extending from the other apertures of the respective pairs and each opening into one of said first-mentioned tubes above said piston.

10. A bottle-cleaning means, comprising a reciprocatory fluid-discharge stem, means for causing said stem to be advanced and retracted by the pressure of the rinsing fluid, and means for causing said stem to rotate during its reciprocation.

11. A bottle-cleansing means comprising a fluid-discharge stem having a head or piston, means in which the same is reciprocatorily mounted, a brush carried by said stem, means for admitting the rinsing fluid under pressure to the interior of the first-mentioned means alternately at the upper and lower side of said piston and means for causing said stem to rotate during its reciprocations.

12. A bottle-cleansing means comprising a hollow fluid-discharge stem, having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, and means for admitting fluid under pressure to said tube alternately at opposite sides of said piston to thereby reciprocate said stem.

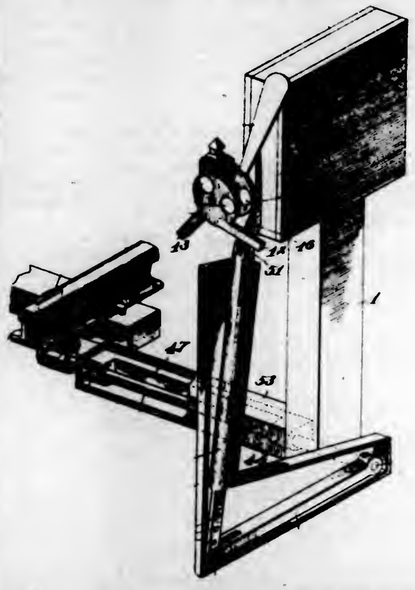
13. A bottle-cleansing means comprising a hollow fluid-discharge stem having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, means for admitting fluid under pressure to said tube alternately at opposite sides of said piston to thereby reciprocate said stem and means for causing said stem to rotate during its reciprocations.

14. A bottle-cleansing means comprising a hollow fluid-discharge stem having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, means for admitting fluid under pressure to said tube alternately at opposite sides of said piston to thereby reciprocate said stem, and brushing means carried by said stem.

15. A bottle-cleansing means comprising a hollow fluid-discharge stem having a piston or head, a tube in which the same is mounted, said tube having a cup to engage the bottle-neck, means for admitting fluid under pressure to said tube alternately at opposite sides of said piston, to thereby reciprocate said stem, brushing means carried by said stem, and means for causing said stem to rotate during its reciprocations.

16. A bottle-rinsing mechanism, comprising a fluid-supply pipe having a discharge-aperture, and means revolubly mounted on said pipe, said revolubly-mounted means being provided with a fluid-discharge stem having a head or piston, a tube in which said stem works, means through which communication of the said aperture with the interior of said tube and below said piston or head is alternately established, and means for turning said stem in said tube during its reciprocations.

812,941. RAILWAY-SIGNAL. WESLEY LOCK, South Omaha, Nebr., assignor, by direct and mesne assignments, of one-half to Emanuel V. Lorig and one-fourth to William C. Lambert, all of South Omaha, Nebr. Filed Apr. 7, 1905. Serial No. 254,220.



Claim.—1. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; and means for pivotally moving said signal-arm comprising a pivoted operating-arm, a pivoted arm adapted to be moved upon the passage of a car, and a weighted connecting-rod extending between said last-mentioned arm and said operating-arm.

2. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm; a pivoted lever adapted to engage said fingers for moving said arm; a car-operated device for moving said lever in one direction; and a weight adapted to move said lever in the opposite direction.

3. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm and spaced apart; a pivoted lever extending between said fingers for moving said arm; means for moving said lever in one direction; and means for moving said lever in the opposite direction.

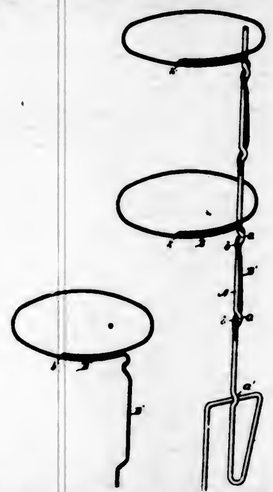
4. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; means for pivotally moving said signal-arm comprising a pivoted operating-arm, a pivoted arm adapted to be moved upon the passage of a car, and a weighted connecting-rod extending between said last-mentioned arm and said operating-arm; and an escapement for controlling the gravity movement of said weighted rod.

5. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm; a pivoted lever adapted to engage said fingers for moving said arm; a car-operated device for moving said lever in one direction; a weight adapted to move said lever in the opposite direction; and an escapement for controlling the gravity movement of said weight.

6. In a signal-operating mechanism, in combination, a pivotally-mounted signal-arm; two fingers fixed with relation to said signal-arm and spaced apart; a pivoted lever extending between said fingers for moving said arm; car-operated means for moving said lever in one direction; a weight for moving said lever in the opposite direction; and an escapement for controlling the gravity movement of said weight.

812,942. PLANT-SUPPORT. CHRISTIAN LUND, Weimar, Wis. Filed June 17, 1905. Serial No. 265,736.

Claim.—1. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, the upright portions of said stake having an offset to receive the transverse portion of the base thereof; and a plant-engaging loop formed of a single piece of wire having a free outturned end and a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.



2. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downward; and a plant-engaging loop formed of a single piece of wire having a free outturned end and a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

3. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, the upright portions of said stake having an offset to receive the transverse portion of the base thereof; and a plant-engaging loop formed of a single piece of wire having a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

4. In a plant-support, the combination of a stake formed of a single piece of wire having offsets at spaced intervals, and having a base formed by bending its lower end upwardly, thence transversely, thence downwardly; and a plant-engaging loop formed of a single piece of wire having a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

5. In a plant-support, the combination of a stake formed of wire having offsets at spaced intervals; and a plant-engaging loop formed of a single piece of wire having a free end and a stake-engaging arm with bends therein, spaced to correspond with said offsets in said stake, for the purpose specified.

6. In a plant-support, the combination of a stake formed of wire having offsets at spaced intervals; and a plant-engaging loop formed of a single piece of wire having a stake-engaging arm with bends therein spaced to correspond with said offsets in said stake, for the purpose specified.

7. A plant-supporting stake formed of a single piece of wire, having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, the upright portions of said stake having an offset to receive the transverse portion of the base thereof, as specified.

8. A plant-supporting stake formed of a single piece of wire, having a base formed by bending its lower end upwardly, thence transversely, thence downwardly, as specified.

812,943. ANNEALING-BOX. JOHN J. MARSHY, Anderson, Ind. Filed Oct. 23, 1905. Serial No. 284,020.

Claim.—1. An annealing-box provided with an arch in the interior thereof, supports for the arch, and a box-top on the arch unattached thereto and attached to the body of the box.

2. An annealing-box including sides and ends, and a crowning or arched top part on the sides and ends attached thereto and provided with a tie-rod attached to the top part and also to the sides.

3. An annealing-box having a top provided with a supporting-arch unattached thereto and free to expand longitudinally in the box, the arch being normally in contact with the box-top, a tie-rod attached to the sides of the box and extending across the interior of the box at the upper portion thereof, and supports for the arch.

4. An annealing-box having a top provided with a supporting-arch unattached thereto and comprising a main member and also a pair of side members secured to the main member and having each a lateral flange, supports for the arch, and a tie-rod extending across the interior of the box and having the ends thereof welded to the sides of the box.

5. An annealing-box having a crowning-top and provided with a pair of posts in the interior thereof, means for connecting the posts with the sides of the box, a tie-rod extending across the interior of the box and welded to the sides thereof, and an arch resting upon the pair of posts and normally in contact with the top of the box but unattached thereto.

6. An annealing-box having a crowning-top and provided with a pair of posts in the interior thereof, means for connecting the posts with the sides of the box, a tie-rod extending across the interior of the box and attached to the sides thereof, the tie-rod having heads hidden in the side walls, an arch resting on the pair of posts and normally in contact with the top of the box but unattached thereto, and a tie-bar attached to the ends of the arch.

7. An annealing-box including sides and ends, a tie-rod welded to the sides of the box, and a top part on the sides and ends of the box and having flanges welded to the tie-rod.

8. In an annealing-box, the combination with the sides thereof having a frame connected to the bottom thereof, and with angle-irons secured to the inner sides of the box sides, of a pair of posts extending substantially from the frame between pairs of the angle-irons and secured thereto, the tops of the posts being below the plane of the tops of the angle-irons, an arch resting upon the tops of the posts between angle-irons, and a tie-rod attached to the sides of the box, the box having a top supported by the arch but unattached thereto.

9. In an annealing-box, the combination with the sides and the top thereof, of posts supported in the box against the sides thereof, an arch mounted on the posts and extending under the top of the box but unattached thereto, and guide-studs attached to the top of the box and projecting at opposite sides of the arch.

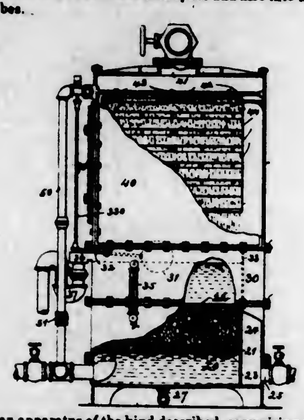
10. In an annealing-box, the combination of two side parts and a crowning or arched top part and also a tie-rod therefor, all welded together, an arch for supporting the top part, supports for the arch connected with the side parts, and end parts attached to the side parts and the top part.

11. In an annealing-box, the combination of two side parts and connected end parts, a tie-rod extending through the side parts, a crowning or arched top part on the side parts and end parts, and having flanges extending over the ends of the tie-rods, an arch for supporting the top part, supports for the arch, and lateral supports for the arch.

812,944. FEED-WATER HEATER. HENRY G. MILLER, Cleveland, Ohio, assignor to The Low Supply & Manufacturing Company, Orange, N. J., a Corporation of New Jersey. Filed May 24, 1905. Serial No. 262,020.

Claim.—1. An apparatus of the kind described, comprising a chamber, tubes arranged in said chamber and open to permit of the

free passage of steam therethrough, a sprinkling-pipe for supplying with water the space in said chamber containing said tubes, and means for the inlet of steam into said space and also into the interiors of said tubes.



2. In an apparatus of the kind described, comprising a chamber having a steam-space therein: tubes each arranged in said steam-space and open at each end to permit the free passage of steam therethrough, whereby said tubes are heated by steam within and around the same, diaphragms arranged in said space and connecting the tubes with each other, and a water-sprinkling pipe arranged above the uppermost tube

3. In an apparatus of the kind described, comprising a chamber adapted to receive steam, tubes, each arranged in substantially horizontal position and open at each end to permit the free passage of the steam, such tubes being arranged in vertical series, each tube connected to its neighbor above and below by a diaphragm in combination with a water-sprinkling pipe arranged above the uppermost tube and a shallow sediment-receptacle beneath the lowermost tube.

4. In an apparatus of the kind described, a steam and water chamber, tubes, each made of heat-conducting material and arranged in a substantially horizontal position and open at each end to permit of the free passage of steam therethrough, said tubes being arranged in vertical series, diaphragms exposed to the steam and water in said chamber and connecting each tube with its neighbors above and below, means through which water is supplied to the space in said chamber around said tubes and a steam-inlet means having communication with said space and also with the interiors of said tubes.

5. In an apparatus of the kind described, comprising a chamber adapted to receive steam, tubes, each made of heat-conducting material and arranged in a substantially horizontal position and open at each end to permit of the free passage of the steam, such tubes being arranged in vertical series, each tube connected to its neighbor above and below by a conducting-diaphragm in combination with a water-sprinkling pipe arranged above the uppermost tube, and a shallow sediment-receptacle beneath the lowermost tube.

6. In an apparatus of the kind described, comprising a chamber having a steam and water space therein, a plurality of tubes arranged in vertical series in said space, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam through it, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered.

7. In an apparatus of the kind described, comprising a chamber having a steam-space therein, a plurality of tubes arranged in vertical series in said space, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam through it, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, in combination with a water-sprinkling mechanism arranged above the tubes and supplying said space with water.

8. In an apparatus of the kind described, comprising a chamber having a steam and water space therein, a plurality of tubes arranged in vertical series in said space, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam through it, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, and so arranged that each tube has a portion of its surface vertically beneath the surface of its nearest neighbor above it in each adjacent series.

9. In an apparatus of the kind described, comprising a chamber having a steam-space therein, a plurality of tubes arranged in vertical series in said space, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam through it, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, and so arranged that each tube has a portion of its surface vertically beneath the surface of its nearest neighbor above it in each adjacent series, in combination with a water-sprinkling mechanism arranged above the tubes.

10. In an apparatus of the kind described, comprising a chamber adapted to receive steam, a plurality of tubes arranged in vertical series, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, and a shallow sediment-receptacle beneath the lowermost tube in each series.

11. In an apparatus of the kind described, comprising a chamber adapted to receive steam, a plurality of tubes arranged in vertical series, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, and a shallow sediment-receptacle beneath the lowermost tube in each series, in combination with a water-sprinkling mechanism arranged above the tubes.

12. In an apparatus of the kind described, comprising a chamber adapted to receive steam, a plurality of tubes arranged in vertical series, each tube being substanially horizontal in position and open at each end to permit of the free passage of steam and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, and so arranged that each tube has a portion of its surface vertically beneath the surface of its nearest neighbor above it in each adjacent series, and a shallow sediment-receptacle beneath the lowermost tube in each series.

13. In an apparatus of the kind described, comprising a chamber: a plurality of series of heat-radiating tubes arranged in said chamber, said tubes being open to permit the free passage of steam through the same and having external diaphragms which connect with each other the tubes of each series, said tubes and diaphragms being arranged to provide a steam and water passage-way between the two series, means through which said passage-way is supplied with water and means through which said passage-way and the interiors of said tube are supplied with steam.

14. In an apparatus of the class described, comprising a chamber: a plurality of heat-radiating tubes arranged in a vertical series in said chamber, said tubes being open to permit the free passage of the steam through the same, a diaphragm connecting each of said tubes with its neighbors above and below it, a second vertical series of heat-radiating tubes, arranged to alternate with the tubes of the first series, a diaphragm connecting each tube of said second series with its neighbors above and below, and means for supplying the interiors of said tubes and the passage-ways between the two series of tubes and diaphragms with steam and water respectively.

15. In an apparatus of the kind described, comprising a chamber: a plurality of series of tubes arranged in said chamber, said tubes being open to permit the free passage of steam through the same and having external diaphragms which connect with each other the tubes of each series, and said plurality of series of tubes and diaphragms being so related that the intermediate tubes of each will confront the diaphragms and be between the contiguous tubes of its companion series, whereby there is formed a circuitous passage-way between the two series, means through which said passage-way is supplied with water and means through which said passage-way and the interiors of said tubes are supplied with steam.

16. An apparatus of the kind described, comprising a chamber having a steam-conduit at one side and having its interior in communication with said conduit, a series of open tubes arranged in said chamber and having communication with said conduit, whereby the steam enters the interior of the chamber and also flows through said tubes, diaphragms connecting said tubes in series, and a sprinkling-pipe for supplying said chamber with water which commingles with the steam in the chamber and is further heated by the radiant heat of the tubes and diaphragms.

17. In an apparatus of the kind described, comprising a chamber adapted to receive steam, a plurality of tubes arranged in vertical series, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam, and each connected to its neighbor above and below by a diaphragm, the tubes in adjacent series being staggered, and so arranged that each tube has a portion of its surface vertically beneath the surface of its nearest neighbor above it in each adjacent series, in combination with a water-sprinkling mechanism arranged above the tubes, and a water-receiving chamber comprising a filter arranged below the series of tubes.

18. In an apparatus of the kind described, comprising a steam-chamber provided with inlet and outlet steam-conduits, a plurality of tubes arranged in vertical series, each tube being substantially horizontal in position and open at each end to permit of the free passage of steam through the same, and each connected to its neighbor by a diaphragm, the tubes in adjacent series being staggered and so arranged that each tube has a portion of its surface vertically beneath the surface of its nearest neighbor above it in each adjacent series, in combination with a water-sprinkling mechanism arranged above the tubes, a water-receiving chamber comprising a filter arranged below the tubes and doors in the wall of the steam-chamber giving access to the tubes.

19. An apparatus of the kind described, comprising a steam-chamber provided with a conduit through which the same is supplied with steam and having a water-receiving chamber at one end portion, tubes arranged in series in the steam-space of said chamber and in advance of said water-receiving chamber, said tubes being open for the passage of steam through the same and having communication with said conduit, diaphragms connecting with each other the tubes of each series, and a water-supplying means arranged in advance of said series of tubes, for supplying with water the steam-containing passage-way between the series of tubes.

20. An apparatus of the kind described, comprising a chamber provided with a conduit through which the same is supplied with steam and having a water-receiving portion at one end, tubes arranged in series in the steam-space of said chamber and in advance of said water-receiving chamber, said tubes being open for the passage of steam through the same and having communication with said conduit, and the tubes of one series alternating in position with those of the next series, diaphragms connecting with each other the tubes of each series, and a water-supplying means arranged in advance of said series of tubes for supplying with water the steam-containing circuitous passage-way between the series of tubes.

812,945. BURIAL-CASKET. JOSEPH H. KYLE, Richmond, Ind., assignor to Richmond Casket Company, Richmond, Ind., a Corporation of Indiana. Filed Nov. 17, 1905. Serial No. 287,780.

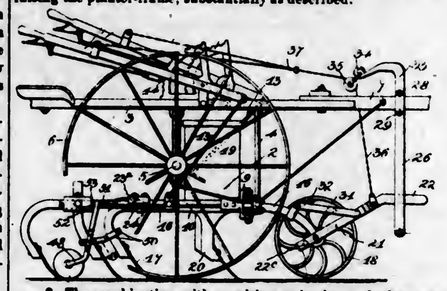
Claim.—1. A burial-casket comprising in combination the body and the top, the former having an angular rabbet formed in its upper portion and the latter having a flange to rest in said rabbet when the top is in place in either its normal or its inverted position, and means for detachably securing the top to the body automatically in both positions, all substantially as set forth.

2. A burial-casket having in combination a body and a top therefor, the body having a rabbet formed in its upper inner edge and the top having an outer flange portion adapted to enter and rest in said rabbet when the top is in place in either its normal or its inverted position, means whereby the top may be lifted independent of the body, and means for detachably securing the top to the body when the top is in either its normal or its inverted position, all substantially as set forth.

3. In combination with a casket having a removable top, means for detachably securing the top which means consists of vertically-disposed perforated spring-tongues secured at their lower ends in channels therefor in the center of each end of the casket, pins extending out from each end of the top and adapted to register with and enter the perforations in the spring-tongues when the lid is in either its normal or inverted position, means whereby said spring-tongues may be released from the pins, and lifting-hooks secured to each end of the lid, all substantially as shown and described.

812,946. CULTIVATOR ATTACHMENT. WADE H. MITCHELL, Rugby, Tex. Filed June 5, 1905. Serial No. 263,893.

Claim.—1. In a combined cultivator and planter, the combination of a guide-arm depending from the draft-tongue of the cultivator, said guide-arm consisting of two spaced bars, one of which has an extended angularly-bent portion formed with a hook, a planter-frame supported upon the cultivator-frame, a guide-bar having a forked end pivotally connected to the frame of said planter, and a forwardly-extending portion projecting between the spaced bars of the guide-arm and movable vertically therebetween, an adjustable clip upon the planter-frame, a link or strap connecting said clip and said guide-bar, a pulley upon said hook, and a flexible operating connection passed around said pulley and connected to said guide-bar for raising the planter-frame, substantially as described.



2. The combination with a cultivator having a draft-tongue, swinging shovel-beams and levers for operating the latter, and a planter having shovel-beams and a forwardly-projecting guide-bar, of means for connecting the beams of said cultivator and planter, a guide-arm depending from said tongue and consisting of spaced bars, one of which has an extended upper end formed with a hook, the guide upon said planter being adapted to project between said spaced bars, a pulley upon said hook, adjustable clips upon said levers, and a flexible operating connection passed around said pulley and having one of its ends attached to said guide-bar upon the planter and its other end forked and secured to said clips upon said levers, substantially as described.

3. The combination with a cultivator having shovel-beams, and a planter having shovel-beams, of a connecting cross-bar having at its end, socket portions to receive said cultivator shovel-beams, U-shaped bolts for clamping the latter in said socket portions, clips upon said planter shovel-beams, eyebolts adjustably secured in longitudinal slots formed in said cross-bar, and bolts passed through said clips and the eyes of said eyebolts, to connect the planter shovel-beams to said cross-bar, substantially as described.

4. The combination with a cultivator having shovel-beams, and a planter having shovel-beams, of a cross-bar connecting the beams of said planter and cultivator, spaced bars upon the beams of said planter, hangers adjustably pivoted between said spaced bars, gage-wheels upon the lower ends of said hangers, and adjustable spring connections between the upper ends of said hangers and said cross-bars for yieldably holding said hangers in an adjusted position, substantially as described.

812,947. COMBINATION-TOOL OF THE HAMMER TYPE. HERMAN B. B. MOLKENTHIN, Coeur d'Alene, Idaho. Filed May 18, 1904. Serial No. 208,543.

Claim.—1. A tool having a hammer-head 12 and a pointed nail-setting head 14 disposed side by side with their adjacent faces in substantially parallel relation and provided with the undercut apertures 16 on opposite sides of the body for the purpose set forth.

2. In a tool of the class described, the combination with a handle and a body transverse thereto, of a nail-driving head and a nail-extracting claw on one side of the handle and substantially parallel to each other, a nail-setting head, and an apertured head also substantially parallel and extending on the opposite side of the handle, said nail-setting head being longer and extending beyond said apertured head, said aperture in said apertured head adapted to receive the point of a nail.

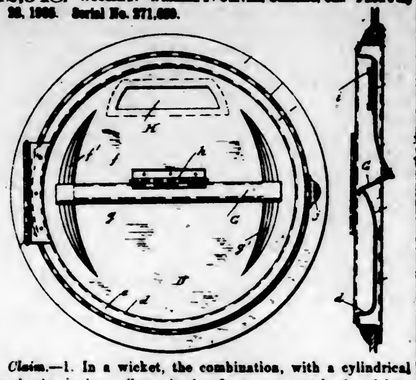
812,948. WICKET. WILLIAM F. OLIVER, Oakland, Cal. Filed July 28, 1905. Serial No. 271,689.

magnet, a plurality of pivoted armature-arms opposite to the electro-magnet, one or more thereof having lateral projections attached thereto, and a rotative shaft having a crank or lever device attached

revoluble about said pivot center, said lever-arm having attached

of supports at either end of the places to be connected and intermediate supports, duplicate rope-drums with ropes on all supports,

812,948. **WICKET.** WILLIAM F. OLIVER, Oakland, Cal. Filed July 28, 1905. Serial No. 271,689.



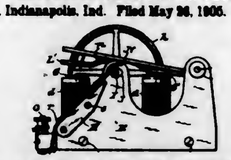
Claim.—1. In a wicket, the combination, with a cylindrical frame having an inwardly-projecting flange at one end, of a wicket-panel hinged to the said frame and provided with a cylindrical rim arranged inside the said frame and provided at its outer end with a flange which overlaps the said flange of the frame.

2. In a wicket, the combination, with a frame, of a wicket-panel hinged to the said frame and provided with a slot which extends across its middle part, the panel being bent outwardly above the said slot and being bent inwardly below the said slot.

3. In a wicket, the combination, with a frame, of a wicket-panel hinged to the said frame and provided with a slot which extends across its middle part, the panel being bent outwardly above the said slot and being bent inwardly below the said slot, and a cover-plate hinged to the upper edge of the said slot and normally resting on its lower edge and being arranged to open upward.

4. In a wicket, the combination, with a frame having an inwardly-projecting flange, and means for securing the said frame in position, of a wicket-panel hinged to the said frame and provided with a rim which is arranged inside the said frame, said panel being also provided with an outwardly-projecting flange which overlaps the aforesaid flange on the frame.

812,949. **ELECTROMAGNETIC POWER-GENERATOR.** JOSEPH L. POTTER, Indianapolis, Ind. Filed May 26, 1905. Serial No. 262,349.



Claim.—1. A power-generator including a plurality of vibrating arms, means for actuating the arms, and a rotative shaft having a device carried thereby intermittently engaged by the arms and actuated directly thereby.

2. An electromagnetic power-generator including a rotative shaft having a crank or lever device attached thereto, an electromagnetic core, and a movable armature mounted opposite to the core and also opposite to the crank or lever device and intermittently engaging the crank or lever device.

3. An electromagnetic power-generator including a rotative shaft having a crank or lever device attached thereto, an electromagnet, and a plurality of armatures mounted movably oppositely to the electromagnet and having intermittent contact with the crank or lever device and also intermittently disconnected therefrom.

4. An electromagnetic power-generator including an electromagnet, a plurality of armatures mounted movably at the electromagnet, and a rotative shaft having a crank or lever device attached thereto and movable into and out of contact with the armatures and coöperating therewith.

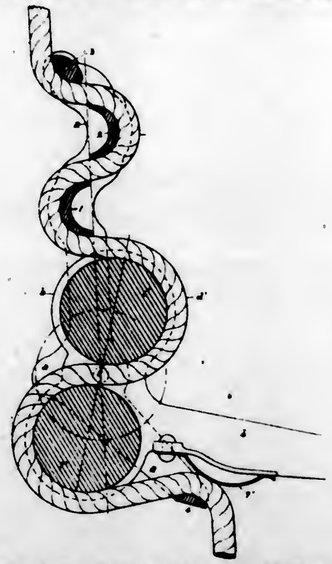
5. An electromagnetic power-generator including an electromagnet, a plurality of pivoted armature-arms opposite to the electromagnet, one or more thereof having lateral deflections formed therein, and a rotative shaft having a crank or lever device attached thereto and movable into and out of contact with the deflections of the armature-arms and coöperating therewith.

6. An electromagnetic power-generator including an electromagnet, a plurality of pivoted armature-arms opposite to the electromagnet, one or more thereof having lateral projections attached thereto, and a rotative shaft having a crank or lever device attached thereto and movable into and out of contact with the projections of the armature-arms and coöperating therewith.

7. An electromagnetic power-generator including an electromagnet having a pair of cores, a plurality of pivoted armature-arms extending periodically parallel to the ends of the magnet-cores and periodically moving with parts thereof toward one of the cores in advance of other parts thereof toward the other core, and a rotative shaft having a crank or lever device attached thereto and periodically directly contacting and moving the armature-arms successively away from the cores.

8. An electromagnetic power-generator including a frame, an electromagnet attached to the frame, a brush-holder mounted on the frame, a pivot-rod mounted on the frame, a plurality of armature-arms pivotally mounted on the pivot-rod and extending opposite to the electromagnet, a rotative shaft mounted on the frame and having a crank or lever device attached thereto and directly coöperating intermittently with the plurality of armature-arms, a cam attached to the rotative shaft, a brush mounted on the brush-holder and having intermittent contact with the cam, a circuit-wire connected with the winding-wire of the electromagnet and also with the frame, a battery-wire connected with the winding-wire of the electromagnet, and a battery-wire connected with the brush.

812,950. **FIRE-ESCAPE APPARATUS.** GEORGE B. PRICE, Colorado Springs, Colo. Filed Mar. 23, 1905. Serial No. 251,580.



Claim.—1. In a fire-escape apparatus a slidable carrier, designed to engage a rope or cable, consisting essentially of a rigid frame having three or more frictional arcs fixed superior to, and one frictional arc fixed inferior to a pivot center in said frame; a rotatable member having two fixed frictional spools revoluble about said pivot center; together with a suspension member attached to said rigid frame member; substantially as shown.

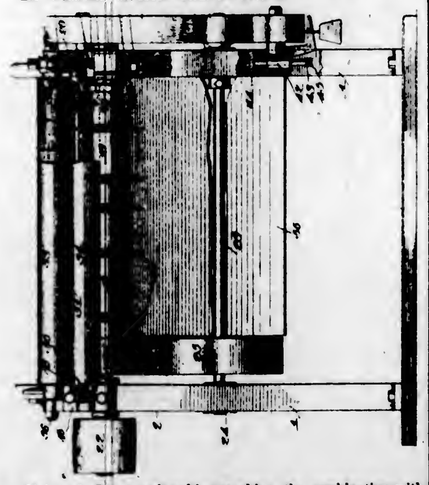
2. In a fire-escape apparatus a slidable carrier having a rigid frame with three or more frictional arcs fixed superior to, and one frictional arc fixed inferior to a pivot center in said frame; an auxiliary rotatable member, held by said pivot center, consisting of two opposite spools fixed to one plane, and a rigid lever-arm extending therefrom designed to engage the said spools against an inclosed rope or cable; substantially as shown.

3. In a fire-escape apparatus a slidable carrier, designed to inclose a rope or cable, having a rigid frame with three or more fixed frictional arcs positioned superior to; and one fixed frictional arc positioned inferior to a pivot center in said frame; a rotatable member having two fixed frictional spools and a projecting lever-arm revoluble about said pivot center, said lever-arm having attached thereto a compression-spring adapted to engage the inclosed rope against the said inferior arc within said frame; substantially as shown.

4. The combination, in a fire-escape apparatus, of a slidable carrier consisting of a non-flexible frame having three or more frictional arcs fixed superior to, and one frictional arc fixed inferior to a pivot center; an auxiliary rotatable member having two fixed spools and a lever-arm pivoted within said frame to said pivot center; a suspension member attached to said frame; and a rope or cable adapted to be engaged by the said frictional arcs and spool; substantially as described.

5. In a fire-escape apparatus the combination of a rope or cable and a slidable carriage or carrier consisting of a non-flexible frame with fixed frictional arcs; a suspension member attached to said frame; a rotatable member having frictional spools and a lever-arm with an attached spring pivoted within said frame, said spring being adapted to engage said rope or cable against a frictional arc of said frame; substantially as shown.

812,951. **SHINGLE-EDGING MACHINE.** CAMILLE PROVOST, Jeanerette, La., assignor of one-half to Alfred B. McGowen, Jeanerette, La. Filed Mar. 18, 1905. Serial No. 250,851.



Claim.—1. In a woodworking-machine, the combination with opposite frame members having corresponding inner flanges, of a saw-table supported upon the flanges and provided with socket and projection detachable connections with the flanges.

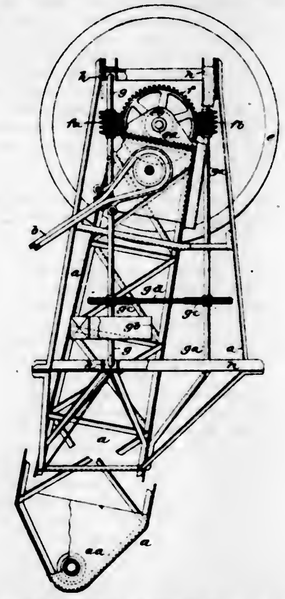
2. In a woodworking-machine, the combination with opposite frame members having corresponding inner horizontal flanges provided upon their edges with outwardly-directed upstanding projections, of a saw-table removably supported upon the flanges and having edge notches receiving the projections.

3. In a woodworking-machine, the combination with opposite frame members having corresponding inner horizontal flanges provided at their edges with upstanding projections, of a saw-table supported upon the flanges and removable vertically therefrom, the opposite ends of the table having notches receiving the projections, and said saw-table being provided with a saw-receiving slot.

812,952. **BRIDGING HORIZONTAL AND VERTICAL SPACES.** ROBERT C. SAYER, Bristol, England. Filed Dec. 28, 1903. Serial No. 186,294.

Claim.—1. In bridging horizontal and vertical spaces, the combination of a support at either end of the places to be connected, a rope-drum with ropes on each support, a rope-carriage connected to the adjacent ends of the ropes, a car-body, slides on the car-body adapted to receive and retain the rope-carriage, and a means for operating the drum to pay out one rope while the other is being hauled in.

2. In bridging horizontal and vertical spaces, the combination of supports at either end of the places to be connected and intermediate supports, duplicate rope-drums with ropes on all supports, rope-carriages connected to the adjacent ends of each pair of ropes between two supports, car-bodies, slides on the car-bodies adapted to receive and retain rope-carriages, a transfer-platform on the intermediate supports and similar slides to the car-bodies, a means for pulling the rope-carriages from the car-body to the platform, a means for traversing the car-bodies on the platform when the rope-carriages are removed so that the carriages of two meeting cars can be transposed, and a means for operating the connected rope-drums in unison.



3. In bridging horizontal and vertical spaces, the combination of a car or body suspended by one rope on each side wound round and secured to a drum, means to keep the drums from rotating, and the same means to rotate the drums when actuated by a motor to let out either rope more or less and traverse the car horizontally or vertically substantially as described.

4. In bridging horizontal and vertical spaces, the combination of a car or body suspended by more than one diagonal rope on each side, each being wound round and secured to a drum that is able to swivel, means to keep the drums from rotating, and the same means to rotate the drums when actuated by a motor to let out either rope more or less and traverse the car longitudinally, vertically and laterally, substantially as described.

5. In bridging horizontal and vertical spaces, the combination of, at places to be connected, a drum carried upon an axle to rotate in bearings upon a support, gear able to hold the drum from rotating or rotate it when driven by a motor, ropes wound upon and secured to the drums at one end the other end hinged to a car or body, a pair of fluid-pressure cylinders hinged to the carriage or car by means of their pistons and to the ropes by means of a quadrant connected to them to level the car, arranging the ropes between the supports and car in straight or diagonal lines, attaching them to the car at one or more points, electric or other means of communication from a generator to the drums, ropes, car-hinges, and a motor to vary the speeds of the drums to let out more or less rope and allow the car to travel in a horizontal, vertical, and lateral direction, terminal stopping-places for the cars at the supports and intermediately, intermediate supports and stopping-places for the car between the terminal supports, the means described or others applicable to change the ropes at the intermediate supports from a car or body going in one direction to a car going in the opposite direction, surplus rope on the drums, letting out the surplus ropes after a car is landed to sink in water it has crossed and allow a vessel to float over it substantially as described.

812,953. MIXING-TILE. GUSTAV R. SCHNEIDER, Detroit, Mich. Filed Aug. 24, 1905. Serial No. 275,542.

Claim.—1. In an ointment or pill slab, the combination with the slab, of a paper-clamping device comprising a cord looped around the slab and engaging therewith upon two opposite ends and a clamping-lever on the under side of the slab and arranged to engage with a bight in the cord and tighten the loop.

2. In an ointment or pill slab, the combination with the slab having the reinforced ends forming a recess in the under side of the slab, of a cord looped around the slab and engaging on the reinforced ends of the slab, and a clamping-lever fulcrumed in the recess on the under side of the slab and adapted to engage with a bight of the cord and tighten the loop.

3. In an ointment or pill slab, the combination of a slab having reinforced ends provided with grooves, a cord or band looped around the slab and engaging into said grooves and a clamping-lever fulcrumed upon the under side of the slab and provided with a series of notches adapted to engage with a bight in the loop of the cord.

4. In an ointment or pill slab, the combination of a slab having reinforced ends forming between them a recess on the under side of the slab and provided with grooves in said ends below the plane of the bottom of the recess, and a self-locking clamping-lever fulcrumed in the recess and provided with a series of notches adapted to variably engage with a bight in the loop of the cord for tightening the same.

5. In an ointment or pill slab, the combination of a slab having reinforced ends forming between them a recess on the under side of the slab and provided with grooves in said ends and with depending lugs in the recess, a cord or band looped around said slab and engaging into said grooves and a clamping-lever provided with a fulcrum-pin adapted to fulcrum said lever upon the depending lugs and lock the same in position, said lever provided with a series of notches for engagement with a bight in the loop of the cord.

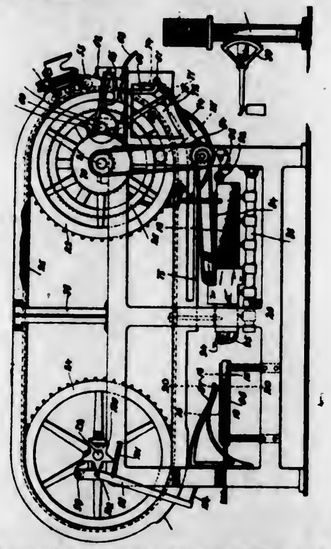
812,954. ANNUNCIATOR-DROP. CHARLES H. SCRIBNER, Jericho, Vt., assignor to Western Electric Company, Chicago, Ill., a Corporation of Illinois. Filed June 24, 1905. Serial No. 266,729.

Claim.—1. In an annunciator, the combination with the indicator thereof, of a pair of electromagnets and biased armatures therefor polarized to respond to direct current of opposite polarity, and catches controlled by said armatures, one of said catches normally engaging the indicator to conceal the same and the other being normally disengaged therefrom, said magnets, upon the passage of alternating current therethrough, rapidly vibrating said catches out of step or phase and maintaining the indicator concealed, while upon the passage of direct current of proper sign through said magnets the first-mentioned catch is operated and the other catch remains inert, thereby displaying said indicator.

2. In an annunciator the combination with the indicator thereof, of a pair of electromagnets and armatures therefor polarized to respond to direct current of opposite polarity, said armatures being biased by means of adjustable springs, catches controlled by said armatures, one of said catches normally engaging the indicator to conceal the same, and the other being normally disengaged therefrom, said armatures having their springs adjusted so that upon the passage of alternating current through the magnets their catches are vibrated out of step or phase and maintain the indicator concealed, while upon the passage of direct current of proper sign through said magnets the first-mentioned catch is operated and the other catch remains inert, thereby displaying said indicator.

812,955. APPARATUS FOR FORMING AND SOLDERING CAN-BODIES. LEE C. SHARP, Omaha, Nebr., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed Jan. 7, 1903. Serial No. 68,773.

Claim.—1. A can-forming machine having a carrier with means for bending the blank to form the can, said carrier being mounted to move uninterruptedly throughout the operation of the machine, blank-holding devices past which the carrier moves to take the blank means for automatically feeding the blanks to the blank-holder, soldering devices past which the carrier moves, an ejector mounted independently of the carrier, and gearing for driving the ejector faster than the carrier and in the direction of movement thereof to throw the can off the carrier.



2. In a can-forming machine, the carrier having a back or body wall in position to be engaged by the can-blank, a mandrel carried rigidly thereby, and folding wings mounted to move over the mandrel.

3. In a can-forming machine, the carrier having a back or body wall, a mandrel carried thereby, folding wings mounted to move over the mandrel, a longitudinally-extending bar fastened to the back plate, and means projecting from the bar, on which means and the back plate the wings are pivoted.

4. The combination of the chain and carrier, the carrier being fastened to the chain, a wheel mounted on the carrier, a second wheel, a shaft on which the second wheel is carried, and a stub-shaft carrying the other shaft and mounted to turn in the carrier.

5. The combination of the chain and carrier, the carrier being fastened to the chain, a wheel mounted on the carrier, a second wheel, a shaft on which the second wheel is carried, and a stub-shaft carrying the other shaft and mounted to turn in the carrier, the stub-shaft extending longitudinally of the chain.

6. In a can-forming machine, the combination with the automatic feed, of the holder receiving the blank tin from the feed, and including tapering pins between which the tin is moved to justify it.

7. In a can-forming machine, the combination with the automatic feed, of the stops between which the feed passes and against which the blank tin is moved, and the outwardly and downwardly curved justifying-arms leading to the stops and notched at points adjacent thereto, for the purpose specified.

8. In a can-forming machine, the solder device, comprising a relatively narrow solder-duct lying longitudinally in the path of the can-carrier, means for supplying solder to the duct, and a metallic strip lying loosely and freely movable in the duct, and floated by the solder therein for the purpose specified.

9. In a can-forming machine, the combination with the automatic feed, of stops between which the feed moves and against which the blank tin is placed, and a clamp working with each stop to clamp the tin thereon.

10. The combination, with a carrier mounted to move through the machine, and comprising folding wings adapted to bend and form the blank, and also comprising means for releasably holding the wings either in open or closed position, of stationary tracks past which the carrier runs to open and close the wings, the tracks for opening the wings being divergent and having their near edges adapted to enter between the contiguous ends of the wings so that the wings will ride along said divergent tracks to spread the wings apart and means for driving the carrier.

11. The combination of moving carrier having wings for bending the blank and also having means for releasably holding the wings either in open or closed position, converging rails along which the wings move to close them, diverging rails along which the wings move to open them, the divergent rails having their near edges adapted to enter between the contiguous ends of the wings so that as the wings ride on said rails the wings are spread apart and means for driving the carrier.

12. In can-forming machine, the combination of the carrier comprising the body part, the mandrel carried thereby, the wings arranged to fold over the mandrel, a gripper coacting with the mandrel, a lever adapted to be actuated to release the gripper, and a spring pressing on the lever to hold the gripper normally in active position, means for moving the carrier through the machine, and means for operating said lever.

13. In a can-forming machine, the carrier comprising the combination with the body part, the mandrel carried thereby and the wings arranged to fold over the mandrel, of a gripper coacting with the mandrel, a lever adapted to be actuated to release the gripper, a spring pressing on the lever to hold the gripper normally in active position, and a roller carried on an axis transverse to the length of the lever, for imparting movement to the lever contrary to the spring.

14. In a can-forming machine, the carrier having the body portion, the mandrel, the wings arranged to fold over the mandrel, said wings having eccentric projections adjacent to their pivoted ends, and a spring bearing on said eccentric projections and serving to hold the wings releasably either in open or closed position.

15. The combination of the chain and carrier, the carrier being fastened to the chain, two members carried by the carrier and adapted to run on a guiding-track, and means for mounting one of said members to swing around an axis essentially longitudinal of the chain, said means comprising a shaft transverse to the chain and a stub-shaft carrying the first-named shaft and mounted to turn in the carrier longitudinally of the chain.

16. In a can-forming machine, the combination with the means for forming and soldering the can, of the automatic feeding device comprising a swinging arm, a suction-head carried thereby for grasping the blank tin, a pump, an operating connection between the swinging arm and the pump to operate the latter, and gearing connecting the swinging arm with the means for forming and soldering the can.

17. The combination of a swinging arm, a suction-head carried thereby, a pump-cylinder having connection with the suction-head, a pump-piston, an operating connection between the swinging arm and the pump-piston, and means for driving the swinging arm.

18. The combination of a suction-head, means for movably mounting the same, a pump, a pneumatic connection between the pump and suction-head, a mechanical connection between the suction-head and pump to operate the two in unison, and means for driving said parts.

19. In a can-forming machine, the combination with the automatic feed, of the stops between which the feed passes and against which the blank tin is moved, and the outwardly and downwardly curved justifying-arms leading to the stops.

20. In a can-forming machine, the soldering device comprising means forming a solder-duct adapted to have the can moved over it to supply solder to the seams, and a metallic strip placed loosely and freely movable in said duct whereby to be floated by the solder therein, for the purpose specified.

21. In a can-forming machine, the combination of a moving carrier adapted to form the can, stationary means for holding the blanks in the path of the carrier so that the carrier may engage the blanks, an operative member movable to and from said holding means, automatically to deposit the blanks in the said holding means, and gearing for driving the carrier and the said operative member continuously and in unison.

22. In a can-forming machine, the combination of a moving carrier adapted to form the can, stationary means for holding the blanks in position to be engaged by the carrier, a swinging arm having a gripping device to engage the blanks, said arm swinging to said means for holding the blanks and serving to move the blanks into the said means, and gearing for driving the carrier and arm continuously and in unison.

23. In a can-forming machine, the combination of a carrier adapted to fold the blank to form the can, means for holding the blank in the path of the carrier, a swinging arm arranged to feed the blanks to said holding means, a curved justifying-arm along which the blank is moved in its passage to said blank-holding means, and gearing for operating the said arm and carrier continuously and in unison.

24. In a can-forming machine, the combination of a moving carrier adapted to fold the blank to form the can, means for holding a stack of blanks, means for holding a blank in the path of the carrier to permit the carrier to engage the blank, an operative member movable between the means for holding the pile of blanks and the means for holding the blank in the path of the carrier and serving individually to transfer the blanks from the stack to the means for holding the blanks in the path of the carrier, and gearing for driving the carrier and said operative member continuously and in unison.

25. In a can-forming machine, the combination with the carrier for holding the blank to form the can, of means for feeding the blanks, a blank-holder receiving the blanks from the feeder, said blank-holder including an operating-gripper, and gearing for driving the carrier, the feeding means and the said gripper, continuously and in unison.

26. In a can-forming machine, the combination with the mechanical feeding means, of stops between which the feed moves and against which the blank tin is placed, a clamping or gripping device working against the stops, and means for operating said clamping or gripping device and the feeding means continuously and in unison with each other.

27. In a can-forming machine, the combination of a swinging arm having a gripping device at its free end to engage the blank tin, a stationary blank-holder, and a stationary justifying-arm projecting outward from the stationary blank-holder and following the arc of movement of the swinging arm, whereby to have the edge of the blank move along the justifying-arm as the blank is advanced to the holder, for the purpose specified.

28. In a can-forming machine, the combination of a swinging arm having a gripping device at its free end to engage the blank tin, a blank-holder, and a justifying-arm projecting from the blank-holder and adapted to have the edge of the blank move along the same as it advances to the holder, for the purpose specified, and the said justifying-arm being curved in an arc slightly eccentric to the center of the swinging movement of the arm.

29. In a can-forming machine, the combination with the carrier having the means for shaping the blank to form the can, of a blank-holder adapted to hold the blank in the path of the carrier to be engaged thereby, said blank-holder including a magnet to attract the tin.

30. In a can-forming machine, the combination with the carrier having the means for shaping the can-body, of a blank-holder adapted to receive the blank and hold the same in the path of the carrier, said holder including tapered pins between which the tin is moved to justify it.

31. In a can-soldering machine, the combination of a carrier, comprising the mandrel and the folding wings, the latter having their opposite edges separated to expose the seam in the can, a soldering device over which the carrier runs, said device comprising ribs forming a duct adapted to be received between the said opposite edges of the carrier folding wings, and means for supplying said duct with molten solder.

32. In a can-soldering machine, the combination of a carrier, comprising the mandrel and the folding wings, the latter having their opposite edges separated to expose the seam in the can, a soldering device over which the carrier runs, said device comprising ribs forming a duct adapted to be received between the said opposite edges of the carrier folding wings, and means for supplying said duct with molten solder, said duct having a continuous opening or slot in its upper portion through which the solder passes.

33. In a can-soldering machine, the combination of a carrier, comprising the mandrel and the folding wings, the latter having their opposite edges separated to expose the seam in the can, a soldering device over which the carrier runs, said device comprising ribs forming a duct adapted to be received between the said opposite edges of the carrier folding wings, means for supplying said duct with molten solder, and a metallic strip placed loosely and freely movable within the duct and adapted to be floated by the solder therein, whereby said strip bears upon the seam, for the purpose specified.

34. In a can-forming machine, the combination with the soldering means of the carrier mounted to move past the soldering means and comprising a mandrel and means for folding the can-blank over the mandrel, said mandrel having a groove formed therein and the groove being positioned to lie directly adjacent to the seam in the

can whereby to provide an air-space back of the seam to permit rapid

spring-held bar A^5, and the said submarine also having sling-receiv-

can whereby to provide an air-space back of the seam to permit rapid cooling of the solder.

35. In a can-forming machine, the carrier comprising a mandrel and means for folding the can-blank over the mandrel, said mandrel having a groove formed therein and the groove being positioned to lie under the seam in the can, whereby to provide an air-space back of the seam to permit the rapid cooling of the solder, and a supporting-strip extending longitudinally through the said groove, and adapted to engage the seamed part of the can to support the same against external pressure.

36. In a can-forming machine, the carrier, comprising the body portion, the mandrel supported thereon, the means for folding the blank over the mandrel, a gripper working against the mandrel to hold the blank, an intermediately-fulcrumed lever with which one end of the gripper is pivotally connected, and means working with the other end of the lever automatically to operate the same.

37. In a can-forming machine, the moving carrier comprising a body, a mandrel supported thereon, means mounted on the body for folding the blank over the mandrel, a gripper coacting with the mandrel, for the purpose specified, means having coar action with the gripper to mount the same, a spring pressing the gripper into action, a laterally-projecting part connected with the gripper and an inclined track adapted to be engaged by said part to release the gripper.

38. In a can-forming machine, the carrier comprising the body portion, the mandrel, the folding wings, and a spring coacting with the wings and serving yieldingly to hold the wings either in open or closed position.

39. In a can-forming machine, the carrier comprising the body portion, the mandrel, the folding wings coacting with the mandrel and having extensions projected from the pivoted portions of the wings, and a spring fastened to the body intermediate its ends and having its ends respectively bearing against the said projections, for the purpose specified.

40. In a can-forming machine, the combination of the carrier comprising the folding wings, means for mounting the carrier to move through the machine, converging rails adapted to be engaged by the wings, whereby to close the wings, the said wings having their opposing ends spaced apart, and diverging rails adapted to be entered between said ends of the wings, whereby to throw the wings into open position.

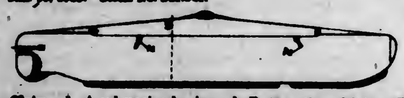
41. In a can-forming machine, the combination with the carrier moving continuously and uninterruptedly throughout the operation of the machine, of a lever mounted independently of the carrier and past which the carrier moves, a dog on the lever, to engage the can and throw it off of the carrier, and means for operating the lever, said lever moving in the same direction that the carrier moves, but faster than the movement of the carrier, whereby to overtake and eject the can.

42. The combination of a swinging arm, a suction-head carried thereby, a pump, a pneumatic connection between the pump and suction-head, a slotted arm connected with the swinging arm, a link having connection with the pump-piston, and with the slotted arm, and means for imparting a swinging movement to the slotted arm.

43. In a can-forming machine, the combination of the chain, the carrier attached thereto, and the endless guides or tracks on which the carrier is adapted to run, the carrier having two members running on said guides or tracks to mount the carrier, and the carrier also having means for mounting one of said members to swing or rock on the carrier around an axis essentially longitudinal of the chain and central with respect to the carrier.

44. In a can-forming machine, the combination of a chain, a carrier attached thereto and the endless guides or tracks on which the carrier is adapted to run, the carrier having two members running on said guides or tracks to mount the carrier, and the carrier also having means for mounting one of said members to swing on the carrier around an axis essentially longitudinal of the chain.

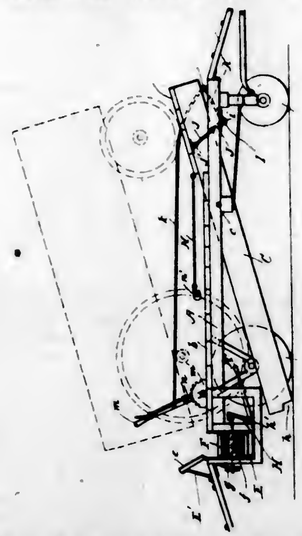
812,956. SUBMARINE VESSEL AND MECHANISM CONNECTED THEREWITH. GEORGE GARNER, Harbor Harbor, N. Y. Filed Jan. 16, 1905. Serial No. 241,541.



Claim.—1. A submarine having a hull strengthened internally by transverse partitions A^5 and longitudinal partitions A^7 in the submerging water-tanks and externally by longitudinal plates A^4 forming an open-faced keel and inclosing between them a projecting spring-held bar A^8, and the said submarine also having sling-receiving devices of sufficient strength to support the submarine in air attached to the submarine's hull above the center of gravity, torpedo-discharging and propeller-operating mechanism being carried by said hull, substantially as described.

2. A submarine having each of the following features, namely: vertical rudder and horizontal rudder, a hull devoid of external steering devices except said rudders and provided with an overhang above a rudder and propeller space, which hull is wider at both ends at the mid-height of said overhang than at the corresponding distance below the center of gravity and is strengthened internally by transverse partitions A^5 and longitudinal partitions A^7 in the submerging water-tanks and externally by longitudinal plates A^4 forming an open-faced keel, sling-receiving devices of sufficient strength to support the submarine in air attached to said hull at about the level of said mid-height, a projecting spring-held bar A^8 between said keel-plates A^4, and an internally-located pump with vertical discharge for regulating the position of the submarine relatively to the plane of the horizon, substantially as described.

812,957. DUMPING MECHANISM. FLAVIUS J. SLEEPER, Newark, Ill. Filed Oct. 12, 1905. Serial No. 282,478.



Claim.—1. In dumping mechanism, the combination, with a platform provided with longitudinal apertures and cross-pieces forming a flooring between said apertures at its middle and rear parts, of tilting beams pivoted in the said apertures, and cross-pieces secured to the upper front end portions of the said beams and normally completing the flooring of the platform when the said beams are level with it.

2. In dumping mechanism, the combination, with a platform provided with longitudinal apertures, of tilting beams pivoted in the said apertures and provided with a cross-piece at their front ends, a shaft provided with a crank and journaled under the front end portion of the said platform, a connecting-rod pivoted to the said crank and cross-piece, an arm secured on one end of the said shaft, an operating-lever pivoted at the rear end of the said platform and provided with a retaining-catch, and a rod connecting the said operating-lever and arm.

812,958. EXPLOSIVE. FIN SPARRE, Wilmington, Del., assignor to The E. I. Du Pont de Nemours Powder Company, Wilmington, Del., a Corporation of New Jersey. Filed Mar. 17, 1905. Serial No. 250,202.

Claim.—1. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose.

2. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose and a liquid hydrocarbon.

3. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose and kerosene.

4. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose, in compressed form.

5. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose and a liquid hydrocarbon, in compressed form.

6. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose and kerosene, in compressed form.

7. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose, the last-named ingredient comprising between five and twenty-five per cent. of the composition.

8. An ammonium-nitrate metallic explosive containing ungelatinized nitrocellulose and kerosene, the nitrocellulose comprising between five and twenty-five per cent. of the composition and the kerosene ten per cent. or less.

9. An explosive composition containing of ammonium nitrate fifty to eighty per cent. of a metallic ingredient five to twenty-five per cent., and of nitrocellulose five to twenty-five per cent.

10. An explosive composition containing of ammonium nitrate fifty to eighty per cent., of a metallic ingredient five to twenty-five per cent., of nitrocellulose five to twenty-five per cent. and of kerosene ten per cent. or less.

11. An explosive composition containing ammonium nitrate, ferrosilicon and nitrocellulose.

812,959. EXPLOSIVE. FIN SPARRE, Wilmington, Del., assignor to The E. I. Du Pont de Nemours Powder Company, Wilmington, Del., a Corporation of New Jersey. Filed May 6, 1905. Serial No. 259,230.

Claim.—1. An explosive composition containing an oxygen-carrier, ferrosilicon and nitroglycerin.

2. An explosive composition containing nitrate of ammonia, ferrosilicon and nitroglycerin

3. An explosive composition containing an oxygen-carrier, a metallic ingredient, a liquid hydrocarbon, and nitroglycerin.

4. An explosive composition containing an oxygen-carrier, ferrosilicon, kerosene and nitroglycerin.

5. An explosive composition containing nitrate of ammonia, ferrosilicon, kerosene and nitroglycerin.

6. An explosive composition containing nitrate of ammonia, ferrosilicon, kerosene, nitrate of sodium and nitroglycerin.

7. A nitrogleceria explosive composed of nitroglycerin and a base containing of an oxygen-carrier sixty-five to eighty-five per cent. and of a metallic ingredient ten to twenty per cent.

8. A nitroglycerin explosive composed of nitroglycerin and a base containing of an oxygen-carrier sixty-five to eighty-five per cent. and of a metallic ingredient ten to twenty per cent., and of a liquid hydrocarbon less than ten per cent.

9. A nitroglycerin explosive composed of nitroglycerin and a base containing of nitrate of ammonia sixty-five to eighty-five per cent., of ferrosilicon ten to twenty per cent., and of kerosene less than ten per cent.

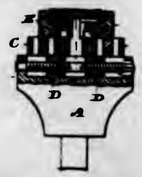
10. An explosive composition containing of an oxygen-carrier fifty to seventy-five per cent., of a metallic ingredient five to twenty per cent., and of nitroglycerin five to twenty-five per cent.

11. An explosive composition containing of nitrate of ammonia fifty to seventy-five per cent., of ferrosilicon five to twenty per cent., of nitroglycerin five to twenty-five per cent., and of kerosene less than ten per cent.

12. An explosive composition containing an oxygen-carrier, a metallic ingredient, a liquid hydrocarbon, nitroglycerin, and charcoal.

13. An explosive composition containing nitrate of ammonia, ferrosilicon, kerosene, nitroglycerin, and charcoal.

812,960. WORK-HOLDER. JAMES W. SPENCE, Racine, Wis. Filed Sept. 29, 1905. Serial No. 280,614.



Claim.—1. A work-holder consisting of a pair of chucks attachable to the adjustable jaws of an engraver's block, and a split-spring bushing constituting a circumferentially-compressible work-support in engagement with the chucks.

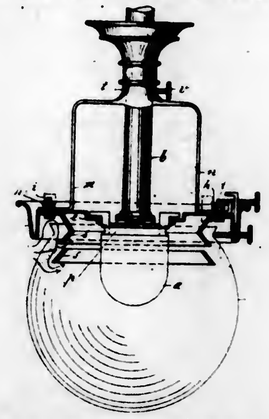
2. A work-holder consisting of a pair of chucks attachable to the adjustable jaws of an engraver's block, and a split-spring bushing having an inner upper lip and which constitutes a compressible work-support in engagement with the chucks.

3. A work-holder consisting of a pair of chucks each provided with a depending pin and an under side groove approximately in line one with the other, the pin being for engagement of a recess in one of the adjustable jaws of an engraver's block and the groove for engagement of a pin projecting from the other of said jaws; and a split-spring bushing constituting a compressible work-support in engagement with the chucks.

4. A work-holder consisting of a pair of chucks attachable to the adjustable jaws of an engraver's block and each having a countersunk upper shoulder of segmental contour, and a split-spring bushing constituting a work-support on the shoulders of said chucks.

5. A work-holder consisting of a pair of chucks each provided with a depending pin and an under side groove approximately in line one with the other, the pin being for engagement of a recess in one of the adjustable jaws of an engraver's block and the groove for engagement of a pin projecting from the other of said jaws.

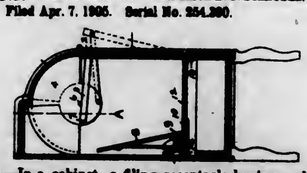
812,961. INVERTED INCANDESCENT GAS-LAMP. THERESE STEINICKE, Berlin, Germany. Filed Nov. 29, 1904. Serial No. 234,793.



Claim.—1. In a lamp of the class described, the combination with a burner-tube, a frame supported thereby, a globe carried by the frame, a socket connected to the frame having openings therein, a mantle carried by said socket and an annular shield extending downwardly from the socket into the globe, said shield surrounding the mantle, substantially as described.

2. In a lamp of the class described, the combination with a burner-tube, a frame supported thereby, a globe carried by the frame, a socket connected to the frame having openings therein, a mantle carried by said socket, an annular shield extending downwardly from the socket into the globe, said shield surrounding the mantle, and means for lowering the frame with relation to tube, substantially as described.

812,962. FILE-CABINET. FREDERICK L. G. STRAUBEL, Green Bay, Wis. Filed Apr. 7, 1905. Serial No. 254,260.



Claim.—In a cabinet, a filing-receptacle having a sliding follower, a front hinged at its lower edge to the cabinet, members attached to the cover and pivotally connected to the ends of the cabinet, and links pivotally connecting said members and the front, whereby the

cover is adapted to swing inward to the rear portion of the cabinet and the front to simultaneously swing outward to an [illegible]

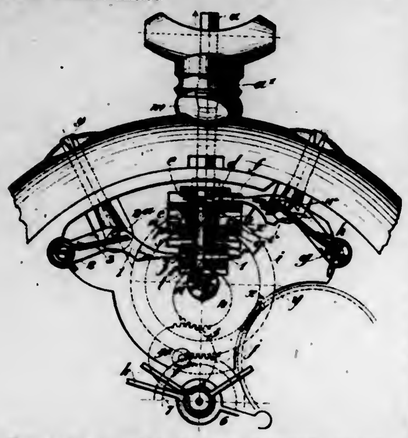
lever pivoted to swing vertically adjacent to said post and provided

2. In an electrical heater, an open-ended, perforated casing of

3. A trunk having lid-operated tray-lifting devices including

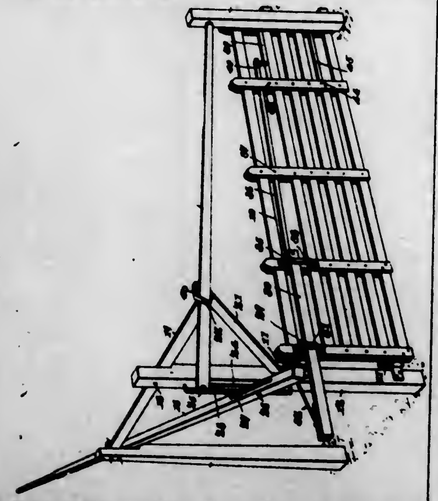
cover is adapted to swing inward to the rear portion of the cabinet and the front to simultaneously swing outward to an inclined position.

812,963. STEM-WINDING MECHANISM FOR TIMEPIECES. CHARLES R. STUDEY, La Chaux-de-Fonds, Switzerland. Filed May 24, 1905. Serial No. 262,054.



Claim.—A clock winding and setting mechanism comprising a longitudinally-movable spindle, a winding-stem slidably and non-rotatively connected with said spindle, a winding-pinion rotatively mounted on said spindle and held in a position to mesh with winding mechanism and provided on one side with a clutch member, a setting-pinion non-rotatively mounted on said spindle and provided with a clutch member, means for engaging the clutch members of said pinions and whereby mesh engagement may be effected between said pinion and time-setting mechanism, an alarm-pinion rotatively and slidably mounted on said spindle, and means whereby mesh engagement may be effected between said alarm-pinion and alarm-setting mechanism.

812,964. GATE. GEORGE W. THOMPSON, Canton, Ill. Filed Nov. 20, 1905. Serial No. 288,266.



Claim.—1. The combination with a post, of a gate hinged to swing therefrom, a lever-arm pivoted to said gate and extending rearwardly of the hinge end of the same, a latch mechanism connected for operation to the inner end of said lever-arm, an operating-lever pivoted to swing vertically adjacent to said post and provided with a longitudinal slot, a rod connecting the inner end of said operating-lever with the protruding end of said lever-arm, and a guide member connected to said post and extending through said longitudinal slot.

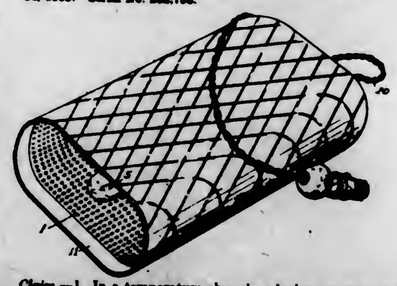
2. The combination with a post, of a gate hinged to swing therefrom, a lever-arm pivoted to said gate and extending rearwardly of the hinge end of the same, a latch mechanism connected for operation to the inner end of said lever-arm, a primary lever swinging vertically and extended in one direction from said post and provided with a longitudinal slot, a secondary lever swinging vertically and extending in the opposite direction from said primary lever, a link pivoted at one end in said slot and pivoted at the other end to said secondary lever, a rod connecting said primary lever and said lever-arm, and a guide member connected to said post and extending through said slot.

3. The combination of a post having a gate hinged to swing therefrom, a post spaced from said hinge-post, a brace member extending transversely of said hinge-post and secured at one end to said spaced post, an operating-lever pivoted to said spaced post adjacent to said transverse brace member and provided with a longitudinal slot, a keeper connected to said spaced post and extending over said transverse brace member and engaging the pivot of said lever, a lever-arm pivoted to said gate and extending beyond the hinge end of the same, a latch mechanism connected for operation to said lever-arm, a rod connecting the inner end of said operating-lever with the protruding end of said lever-arm, and a guide member connected to said hinge-post and extending through said slot.

4. The combination of a post having a gate hinged to swing therefrom, a post spaced from said hinge-post, a brace member extending transversely of said hinge-post and secured at one end to said spaced post, a diagonal brace connected at one end by a bolt to the other end of said transverse brace and with its other end connected to the hinge-post, a primary operating-lever pivoted to said spaced post adjacent to said transverse brace member and provided with a longitudinal slot, a keeper connected to said spaced post and extending over said transverse brace member and engaging the pivot of said primary lever, a secondary operating-lever pivoted to the bolt which unites said transverse and diagonal braces, a clip-bearing over said braces and secondary lever and coupled thereto by said uniting-bolt, a link connecting the adjacent ends of said operating-levers, a lever-arm pivoted to said gate and extending beyond the hinge end of the same, a latch mechanism operative by the action of said lever-arm, a rod connecting the inner end of said primary operating-lever with the protruding end of said lever-arm, and a guide member connected to said hinge-post and extending through said slot.

5. The combination with a post of a gate hinged to swing therefrom, an operating-lever pivoted to swing vertically adjacent to said post, a lever-arm pivoted to said gate and with one end extending rearwardly of the same and with the other end provided with a laterally-extending clip, a rod connecting the adjacent ends of said operating-lever and lever-arm, a latch-lever pivoted to said gate and with one end protruding for engagement with a socket on the latch-post, and an intermediate lever pivoted to the gate with one end extending beneath said laterally-extending clip of the lever-arm and a link coupling the other end of the intermediate lever to the latch-lever.

812,965. ELECTRICAL HEATER. EMMA L. VAUGHN, San Francisco, Cal., assignor to G. X. Wendling, San Francisco, Cal. Filed Oct. 14, 1905. Serial No. 282,706.



Claim.—1. In a temperature-changing device, an open-ended, perforated casing, a partition therein nearer one end than the other, and an electrical translating device connected with said partition.

2. In an electrical heater, an open-ended, perforated casing of substantially the same cross-section throughout its length, a partition therein nearer one end than the other, and an electrical translating device connected with said partition.

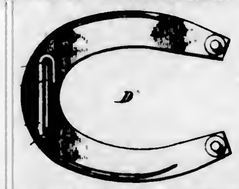
3. In an electrical heater, an open-ended, perforated casing of substantially the same elongated, elliptical cross-section throughout its length, a partition therein nearer one end than the other, and an electrical translating device connected with said partition.

4. In an electrical heater, an open-ended, perforated casing, a partition therein nearer one end than the other, a layer of asbestos on the casing, a textile covering over the asbestos, the ends of which are folded in over the ends of the casing and secured therein, and an electrical translating device secured to the partition.

5. In an electrical heater, an open-ended casing, a partition therein nearer one end than the other, said partition being provided with an opening and having a flange around its edge and also around said opening, a lamp-support through said opening, and means for connecting said support with a source of electrical energy.

6. In an electrical heater, an open-ended casing, a partition therein nearer one end than the other, a switch-socket through the partition provided with a key on the side of the partition closest to the end of the casing, and means for connecting the socket with a source of electrical energy.

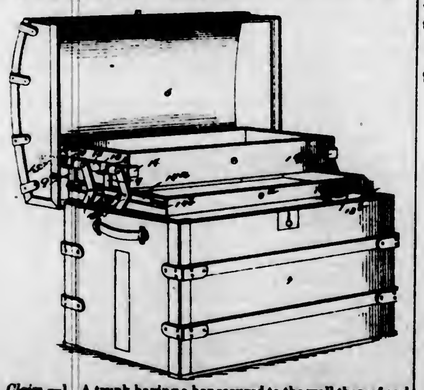
812,966. CALK FOR HORSESHOES. LEWIS A. WHYBURN, Rockford, Ill. Filed Dec. 13, 1905. Serial No. 291,636.



Claim.—1. A toe-calk for horseshoes, comprising a tubular soft-metal casing elongated O-shaped in cross-section, a flat rectangular hard-metal center included in, and preferably projecting edgewise from the outer end of, the casing and metal attaching-pintles inserted between the ends of the center and of the aperture in the casing.

2. A toe-calk for horseshoes, comprising a tubular soft-metal casing elongated O-shaped in cross-section and tapering at its outer end, a flat rectangular hard-metal center included in, and projecting edgewise from the tapering end of, the casing and hard-metal attaching-pintles inserted between the ends of the center and of the opening in the casing.

812,967. TRUNK. CHARLES C. WIGHTON, Morristown, Tenn. Filed Sept. 20, 1905. Serial No. 279,208.



Claim.—1. A trunk having a bar secured to the wall thereof and flanged at the upper edge to rest on the top of the said wall, and tray-supporting means attached to said bar.

2. A trunk having a bar secured inside to the wall thereof, with a flange at its upper edge resting on top of said wall and an offset at its end secured to another wall and forming a corner-piece.

3. A trunk having lid-operated tray-lifting devices including notched bars, and tray-hangers having hooks which engage over said bars, and pins extending across the hooks, which pins rest in the notches and form pivots on which the tray may be swung up and down.

4. A trunk having a plurality of trays, and lid-operated tray-lifting devices comprising bars secured to the end walls of the trunk and having flanges resting on the upper edges thereof, bent links pivoted to the bars, upper tray-supporting bars pivoted to the upper ends of the links, and lower tray-supporting bars pivoted to the links at about the elbows thereof.

812,968. VACUUM-SEALING PRESERVING-CAN. HARRY B. WILLIAMS, Brooklyn, N. Y., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed July 12, 1905. Serial No. 269,268.

Claim.—1. In a vacuum-sealing can, a cap or cover closing the filling-opening in the can, and provided with a raised hub or boss furnished with perforations for escape of air in vacuumizing the can, and a band-valve surrounding said perforated hub or boss to close the perforations therein and thus vacuum-seal the can, substantially as specified.

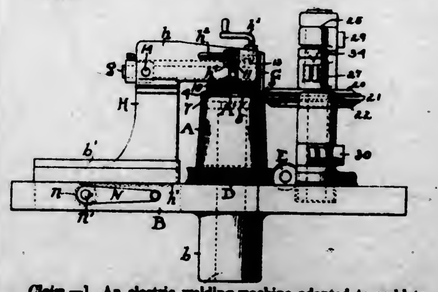
2. In a vacuum-sealing can, a cap or cover closing the filling-opening in the can, and provided with a raised hub or boss furnished with perforations for escape of air in vacuumizing the can, and a band-valve surrounding said perforated hub or boss to close the perforations therein and vacuum-seal the can, and a protecting-cap surrounding and covering said perforated hub or boss and its band-valve, substantially as specified.

3. In a vacuum-sealing can, a cap or cover closing the filling-opening in the can, and provided with a raised hub or boss furnished with perforations for escape of air in vacuumizing the can, and a band-valve surrounding said perforated hub or boss to close the perforations therein and vacuum-seal the can, and a protecting-cap surrounding and covering said perforated hub or boss and its band-valve, and having a soldering-flange soldered to said cap or cover, substantially as specified.

4. A vacuum-sealing vessel having a cap or cover furnished with a perforated boss or hub, and provided with a band-valve fitting thereon, substantially as specified.

5. A vacuum-sealing vessel having a cap or cover furnished with a perforated boss or hub, and provided with a band-valve fitting thereon, and a protection-cap, substantially as specified.

812,969. ELECTRIC WELDING-MACHINE. WILLIAM C. WINFIELD, Warren, Ohio, assignor to The Winfield Manufacturing Company, Warren, Ohio, a Corporation. Filed Jan. 9, 1905. Serial No. 240,216.



Claim.—1. An electric welding-machine adapted to weld together two circular members having matching edges, said machine comprising a pair of electric conductors arranged in an electric circuit with said members and adapted to bear against the same on ep-

posite sides of the said matching edges and upon the outside thereof, rotatable devices to press the edges of said sections together, and means to impart rotation to said devices and thereby

race, the latter provided with a shuttle-exit and a stationary magazine to and from which the lay is adapted to move; of a gate normally

means operated by the movement of the lay to the magazine to forcibly move a shuttle therefrom between and through the aforesaid

ing-current is directed into the current which is delivered by the circulating-fan, and means for feeding the material to be separated to

posite sides of the said matching edges and upon the outside thereof, rotatable devices to press the edges of said sections together, and means to impart rotation to said devices and thereby rotate said members.

2. An electric welding-machine adapted to unite two circular members of the same cross-section together, the same comprising a set of electric conductors arranged to make contact with the said members on opposite sides of their meeting edges, a rotatable support for one of said members, and rotatable means bearing on said other member and adapted to hold said members in edgewise relation between said conductors.

3. A machine adapted to electrically weld two sections of a containing vessel together, said machine having a pair of electric conducting devices, in combination with means to hold said vessel rotatably to a common center in contact with said devices.

4. In a machine for electrically welding together two parts of a vessel having a bottom, a pair of electric conducting devices, and means to hold the said parts of the vessel with their meeting edges midway between said conducting devices and in contact therewith, and means to rotate said vessel having direct operative engagement with one of said sections.

5. In electric welding, a pair of rotating conductors having alined axes, in combination with means to hold separate sections of a containing vessel edge to edge against said conductors and with the said edges between the conductors.

6. In electric welding, a pair of electric conductors, in combination with means to hold two sections of a vessel having a bottom in one section in contact with the said conductors, said means comprising an actuating member in one of said sections and a pressure device on the other.

7. In electric welding, a machine comprising a pair of conductors horizontally disposed with a space between them, in combination with a rotatable support for a vessel-body adapted to engage the vessel inside and means outside to hold the bottom section in welding relation to said body-section.

8. In electric welding, a machine adapted to weld together two sections of a vessel, said machine having a rotating member adapted to engage within one section of the vessel and another rotating member adapted to engage upon the other section of the vessel, and means to electrically weld said sections together.

9. A machine adapted to weld two sections of a vessel together comprising a rotatable device to engage one of said vessel-sections on its inside, and a device to engage the other section on its outside, said devices constructed to center said sections in respect to each other and means to electrically weld said sections together consisting of two conductors in contact with different sections of said vessel.

10. In electric welding, a pair of rotatable conductors, in combination with means to hold two sections of a containing vessel in welding relation thereto, said means comprising a rotatable centering device for one of said sections, a pressure device to bear upon the other section and a roller over the place of contact of said conductors adapted to bear upon the edge of the upper of said sections.

11. In electric welding, means to hold two sections of a vessel edge to edge to be welded, the same comprising a rotatable central guide and support for the lower section of the vessel and a rotatable device to bear upon and center the opposite section, a rolling pressure device to press upon the edge of the vessel and a pair of rotatable electric conductors engaging the side of the vessel above and below the welding-line.

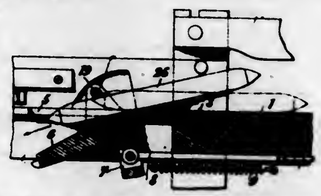
12. In electric welding, means to support two sections of a vessel edgewise together to be welded, consisting of rotatable devices to carry one section of the vessel and pressure and centering devices for the other section of the vessel, and a movable support for said pressure and centering devices.

13. An electric welding-machine for containing vessels comprising a centering and base support for one of said sections, a movable arm over said parts and centering and pressure devices thereon to engage upon the other of said sections.

14. In electric welding-machines, a rotatable base and centering device for a section of a vessel to be welded, and a movable arm and pressure and centering mechanism thereon for another section of a vessel, said parts severally being constructed and arranged to bring said vessel-sections together edge to edge, and a pair of horizontally-arranged electric conductors connecting with different sections of said vessel.

812,970. WEFT-REPLENISHING MECHANISM FOR LOOMS. HERMANN ROSSEY, Schwandingi, Switzerland. Filed Dec. 2, 1904. Serial No. 235,177.

Claim.—1. In a loom, the combination with the lay and shuttle-race and a shuttle-magazine stationary relatively to the lay, the latter having motion to and from said magazine and said race provided with shuttle-exit and a gate normally closing said exit; of means controlled by the thread-break indicator of the loom to open said gate when the weft-thread is absent, means operated by the gate to direct the shuttle into the aforesaid exit and means operated by the movement of the lay to the magazine to feed a fresh shuttle therefrom onto the race.



2. In a loom, the combination with the lay and shuttle-race and a shuttle-magazine stationary relatively to the lay, the latter having motion to and from said magazine and said race provided with shuttle-exit and a gate normally closing said exit; of means controlled by the thread-break indicator of the loom to open said gate when the weft-thread is absent, means operated by the gate to direct the shuttle into the aforesaid exit and means operated by the movement of the lay to the magazine to feed a fresh shuttle therefrom onto the race.

3. In a loom, the combination with the lay and shuttle-race and a magazine stationary relatively to the lay, which latter has motion to and from the magazine, and said race provided with a shuttle-exit; of a gate normally closing said exit, a shuttle-guide operated by the gate, an arm on the latter, means connected to said arm and adapted to be operated by the thread-break indicator of the loom to open the gate and move the shuttle-guide into the path of the shuttle to guide it to the shuttle-exit, and mechanism adapted to feed a shuttle from the magazine to the race and actuated by the aforesaid gate-arm when the lay moves to the magazine.

4. In a loom, the combination with the lay and shuttle-race and a shuttle-magazine stationary relatively to the lay, the latter having motion to and from the magazine and said shuttle-race provided with a shuttle-exit; of a bell-crank lever, one arm of which serves as a gate for the shuttle-exit and normally closes the same, a shuttle-guide adapted to be moved by the gate into the path of a shuttle in the race and guide it into its exit, means adapted to be operated by the thread-break indicator of the loom and acting on the other arm of the bell-crank lever to tilt the same to open the gate and move the shuttle-guide into the path of a shuttle in the race, and means operated by the movement of the lay to the magazine to feed a fresh shuttle therefrom to the race.

5. In a loom, the combination with the lay and shuttle-race and a shuttle-magazine stationary relatively to the lay, said race provided with a shuttle-exit, a gate normally closing the shuttle-exit, and a shuttle-guide carried by the gate and held normally out of the path of the shuttle; of means operating automatically, when the weft-thread is absent to open the gate and thereby move the shuttle-guide into the path of the shuttle in the race and guide it to its exit, and means operated by the movement of the lay to the magazine to feed a fresh shuttle therefrom to the race.

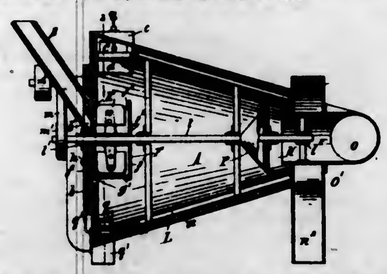
6. In a loom, the combination with the lay and shuttle-race provided with a shuttle-exit, a shuttle-magazine stationary relatively to the lay, a shuttle-ejector adapted to eject one shuttle at a time from the magazine, and a spring-retracted actuating-lever for said ejector, provided at its free end with a pin; of a gate normally closing the shuttle-exit and having a depending arm adapted to be moved in line with the aforesaid pin on the ejector-lever, a shuttle-guide operated by the gate and means to automatically open said gate when the shuttle-thread is absent and thereby move the shuttle-guide into the path of a shuttle in the race and guide it to its exit, and simultaneously move the depending arm on the gate in line with the ejector-lever pin, whereby when the lay moves to the magazine said arm actuates the lever to eject a shuttle from the magazine onto the race.

7. In a loom, the combination with the lay and shuttle-race, the latter provided with a shuttle-exit, a shuttle-magazine stationary relatively to the lay and having a shuttle-outlet in line with the race, and two yielding bars between the race and magazine having flaring lips facing the said shuttle-outlet; of a gate normally closing the shuttle-exit in the race, means to guide a shuttle to said exit when the gate is opened, means to automatically open the gate when the weft-thread is absent and guide the shuttle in the race to its exit, and means operated by the movement of the lay to the magazine to forcibly move a shuttle therefrom between and through the aforesaid yielding bars onto the race.

812,971. PROCESS OF TREATING RAISINS TO REMOVE THE CAP-STEMS. FRANK C. ADAMS, Fresno, Cal., assignor of one-half to John M. Scrapian and George M. Scrapian, Fresno, Cal. Filed Apr. 20, 1903. Serial No. 153,406.

Claim.—The improvement in the art of treating raisins to remove the cap-stems, which consists in subjecting the raisins to a low temperature (approximately 10° to 20° Fahrenheit) and then immediately removing the cap-stems while the raisins are in a cooled condition, substantially as described.

812,972. SEPARATING-MACHINE. HOMER BALDWIN, Youngstown, Ohio. Filed May 16, 1905. Serial No. 260,961.



Claim.—1. In a machine for separating a mixture of solid particles of different size or weight, the combination of an imperforate tapering separating-chamber having near its small end an outlet for the light or fine articles and near its large end an outlet for the heavy or coarse particles, a circulating-fan arranged outside said chamber and having its blast-orifice arranged to deliver the air-current into said chamber near the large end and produce a whirling air-current therein, means for conducting the air-current from the interior of the separating-chamber to the circulating-fan, a fan for feeding the material to be separated into the air-current delivered into the separating-chamber by the circulating-fan, the case of the feeding-fan having a peripheral wall by which the feeding-current is confined and which is provided with a blast-orifice by which the feeding-current is directed into the current which is delivered by the circulating-fan, and means for feeding the material to be separated to said feeding-fan, substantially as set forth.

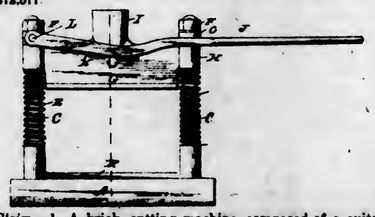
2. The combination of an imperforate, tapering separating-chamber having near its ends outlets for the separated materials, a circulating-fan arranged outside said chamber and having its blast-orifice connected with the large end thereof to produce a whirling air-current therein, means for conducting the air-current from the interior of the separating-chamber to the circulating-fan, a feeding-fan arranged at the large end of said chamber and having the peripheral wall of its case provided with a blast-orifice from which the air-current laden with the material to be separated is delivered into the whirling air-current, and means for feeding the material to be separated to said feeding-fan, substantially as set forth.

3. The combination of an imperforate, tapering separating-chamber having near its ends outlets for the separated materials, a circulating-fan arranged outside said chamber and having its blast-orifice connected with the large end thereof to produce a whirling air-current therein, means for conducting the air-current from the interior of the separating-chamber to the circulating-fan, a feeding-fan arranged within said chamber at the large end thereof and having its case provided with a peripheral blast-orifice, means for adjusting said blast-orifice circumferentially, and means for feeding the material to be separated to said feeding-fan, substantially as set forth.

4. The combination of an imperforate, tapering separating-chamber having near its ends outlets for the separated materials, a circulating-fan arranged outside said chamber and having its blast-orifice connected with the large end thereof to produce a whirling air-current therein, means for conducting the air-current from the interior of the separating-chamber to the circulating-fan, a feeding-fan arranged within said chamber at the large end thereof and having a circumferentially-movable case provided with a blast-orifice, means for adjusting said case circumferentially, and means for feeding the material to be separated to said feeding-fan, substantially as set forth.

5. The combination of an imperforate, tapering separating-chamber having near its ends outlets for the separated materials, a circulating-fan arranged outside said chamber and having its blast-orifice connected with the large end thereof to produce a whirling air-current therein, means for conducting the air-current from the interior of the separating-chamber to the circulating-fan, a feeding-fan arranged within said chamber and having a circumferentially-movable case provided with a blast-orifice, a support secured to said chamber in which said case rests movably, frictional means for holding said case in position while permitting said case to be adjusted in said support, and means for feeding the material to be separated to said feeding-fan, substantially as set forth.

812,973. BRICK-CUTTING MACHINE. HARRY L. BARR and FREDERICK GAMBERT, Mansfield, Ohio. Filed Aug. 3, 1905. Serial No. 272,577.



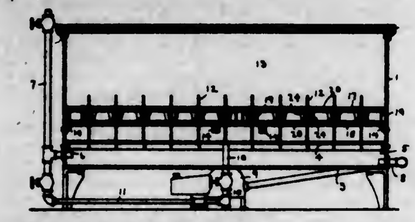
Claim.—1. A brick-cutting machine, composed of a suitable metal base, posts, secured in said base, one upon each side of the center, a lateral steel cutter secured in said base on a line with the center of the posts, an upper adjustable cutter, provided at each end with a hollow sleeve said cutter adapted to have a vertical sliding movement upon the vertical posts, and supported upon suitable coil-springs surrounding said posts the said posts threaded at their upper ends and provided with adjusting-nuts, a lever journaled upon each side of a loose sleeve placed upon the vertical post between the upper cutter and adjusting-nut.

2. In a brick-cutting machine, the combination with a suitable metal base, and vertical guiding-posts, a cutter mounted in said base laterally and in line with the center of the vertical posts, an upper adjustable cutter, adapted to have a vertical sliding movement upon said posts, the upper cutter, supported upon suitable springs, surrounding said posts, a sleeve mounted on one of the posts and a lever journaled to said sleeve and adapted to operate the movable cutter.

---

rounding said posts, a sleeve mounted on one of the posts and a lever journaled to said sleeve and adapted to operate the movable cutter.

812,974. APPARATUS FOR STERILIZING AND CLEANSING BOTTLES. THEODORE G. BATES, Worcester, Mass. Filed Oct. 16, 1903. Serial No. 177,370.

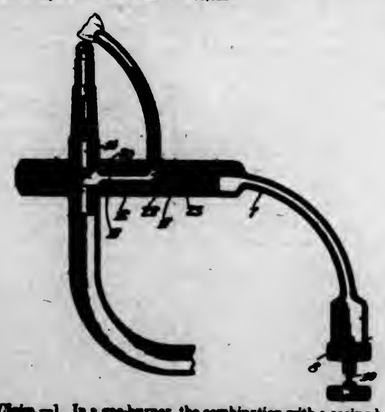


Claim.—1. In a bottle-cleansing apparatus, the combination of a chamber having an open top, a cover for hermetically sealing said top, a false bottom dividing said chamber and forming a steam-chest, means for admitting steam under pressure to said steam-chest, a series of open pipes extending upwardly from said false bottom and communicating with said steam-chest, a frame vertically removable through the open top of said chamber and comprising a series of cages in alinement with said open steam-pipes, said cages having openings at their top to support the body of the bottle and an opening at the bottom to receive the neck of the bottle and hold the bottle in an inverted upright position, and means for supporting said frame above said false bottom.

2. In a bottle-cleansing apparatus, the combination of a chamber having an open top, a cover for hermetically sealing said top, a false bottom dividing said chamber and forming a steam-chest, means for admitting steam under pressure to said steam-chest, a series of open pipes extending upwardly from said false bottom and communicating with said steam-chest, and a bottle-supporting frame vertically removable through the open top of said chamber.

3. In an apparatus for cleansing bottles, a basket for holding the bottles to be cleansed, consisting of a series of interlaced wires in an upper and a lower plane, wire cages held by said interlaced wires having openings at their top to support the body of the bottle and an opening at the bottom to receive the neck of the bottle and hold the bottle in an inverted position.

812,975. GAS-BURNER. SAMUEL BERGHEIM, New York, N. Y. Filed May 16, 1905. Serial No. 260,622.

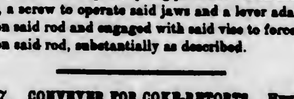


Claim.—1. In a gas-burner, the combination with a casing having a bore, a port leading therefrom to the burner, a port leading from said bore to the service-pipe, an igniter-pipe, a port leading thereto from said bore, a tube one end leading from said bore, and a piston in the other end of said tube, of a reciprocal valve located in the bore of the casing and having ports adapted when the valve is moved in one direction to simultaneously establish communication between the ports leading to the igniter-tube and the port leading from the service-pipe and interrupt communication between the port leading to the burner and the port leading from the service-pipe and when moved in the opposite direction to simultaneously interrupt communication between the port leading to the igniter-tube and the port leading from the service-pipe and establish communication between the port leading to the burner and the port leading from the service-pipe, and means for preventing rotary movement of said valve and limiting its longitudinal movement, substantially as described.

2. In a gas-burner, a casing having a bore, a burner communicating therewith, a service-pipe communicating with said bore and an igniter-pipe communicating with said bore, of a reciprocal valve located in said bore, means for preventing rotary movement of said valve and limiting its longitudinal movement and means for reciprocating said valve to simultaneously establish communication between the burner and service-pipe and interrupt communication between the igniter-pipe and service-pipe or vice versa, substantially as described.

3. In a gas-burner, a casing having a bore, a port leading therefrom to the burner, a port leading from said bore to the service-pipe, an igniter-pipe, a port leading thereto from said bore, a reciprocal valve located in the bore of the casing and having an interior bore, an opening or port leading from said bore and connecting it in constant registry with the port from the service-pipe, an opening or port leading from said bore and adapted to be moved into and out of registry with the port to the burner and a port or opening leading from said bore and adapted to be moved into and out of registry with the port to the igniter-pipe and means for reciprocating said valve, substantially as described.

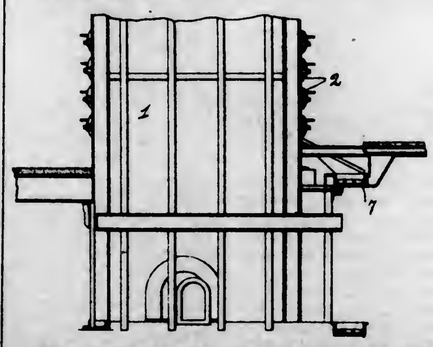
812,976. DENTAL TOOL FOR REMOVING CROWN-PINS. GEORGE T. CARPENTER, Chicago, Ill. Filed June 22, 1905. Serial No. 266,468.



Claim.—1. In a dental tool, the combination with a rod or post, of a vise having formed therethrough a vertically-disposed passage whereby the same is engaged with said post, said vise having its upper end cut away and recessed, and a lever adapted to be engaged with the upper end of said rod and with the recess in said vise whereby the latter is forced outwardly on said rod, substantially as described.

2. In a dental tool, the combination with a rod or post, of a vise having formed therein a vertically-disposed passage whereby the same is engaged with said post, spring-jaws formed on the inner end of said vise, a screw to operate said jaws and a lever adapted to be fulcrumed on said rod and engaged with said vise to force the latter outwardly on said rod, substantially as described.

812,977. CONVEYER FOR COKE-RETORTS. HENRY A. CARPENTER, Swissvale, Pa., assignor to Ritter-Conley Manufacturing Company, Jersey City, N. J., a Corporation of New Jersey. Filed Feb. 24, 1903. Serial No. 144,764.



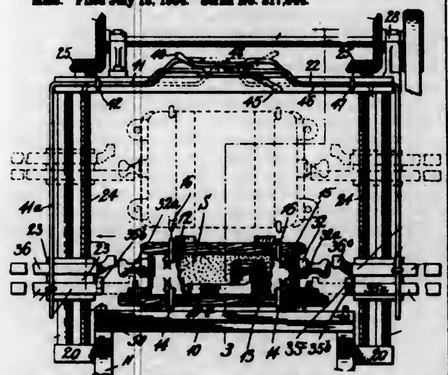
Claim.—1. The combination with a bench of gas-retorts and the furnace therefor, said retorts and said furnace having independent means for discharge, of an endless conveyor having one stretch thereof positioned adjacent the discharge of the coke product and the other stretch thereof positioned adjacent the discharge of the waste products, said stretches of the conveyor being adapted to simultaneously convey away and dump in opposite directions from the places of discharge of the coke product and the waste products.

2. The combination with a bench of gas-retorts and the furnace therefor, said retorts and said furnace having independent means for discharge of their products, of a conveyer comprising a single endless carrier having one stretch thereof positioned adjacent the discharge of the coke product, and the other stretch thereof positioned adjacent the discharge of the waste products, and troughs in which the respective stretches of the endless conveyer travel, said stretches of the conveyer being adapted to simultaneously convey away and dump in opposite directions from the places of discharge of the coke product and the waste products by the utilization of the uppermost parts of said stretches.

812,978. WALL-PLASTER. JAMES W. CRAIG, Buffalo, N. Y. Filed May 26, 1905. Serial No. 262,492.

Claim.—A wall-plaster composed of the following ingredients, viz: calcined gypsum, Portland cement, acetic acid, sand and palmetto-root fiber, in the proportions specified.

812,979. MOLDING-MACHINE. ARTHUR CROCKNER, Holyoke, Mass. Filed July 13, 1904. Serial No. 217,044.



Claim.—1. The combination, with a table and a flask, having trunnions, of heads having grooves, and mounted for vertical movement relative to said table, and devices movable in said grooves, and for raising said flask bodily.

2. The combination, with a table and a flask, having trunnions, of heads mounted for vertical movement relative to said table, and devices carried by said heads, and means for moving said devices toward and away from each other.

3. The combination, with a table, and a flask having trunnions, of devices for raising said flask bodily, comprising a pair of heads arranged for vertical movements relatively to said table, a pair of vertically-arranged screws in threaded engagement with said heads, and having bevel-gears at their ends, a horizontally-mounted shaft having bevel gear-wheels in mesh with the gears on the vertical screws, and means for rotating said horizontal shaft.

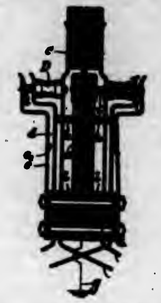
4. The combination, with a table and a flask, having trunnions, of guide-rods, heads movable on said rods, devices carried by said heads, and for raising said flask bodily, relative to said table, means for moving said devices toward and away from each other, and a pair of screws in threaded engagement with said heads.

812,980. SELF-SOLDERING HEAT-CARTRIDGE AND PROTECTIVE APPARATUS. FRANK B. COOK, Chicago, Ill. Filed Nov. 26, 1904. Serial No. 234,269.

Claim.—1. In a device of the character described, an inclosing shell, suitable conducting end caps therefor and secured thereto, and a heat-producing member extending completely through the said shell and end caps and projecting from at least one end of the device.

2. In a heat-cartridge of the character described, a heat-producing member extending completely through and projecting at one end of the cartridge, whereby when operated, the cartridge is conditioned for another operation in a reversed position.

3. A thermal protector having a heat-producing, circuit-controlling member extending completely therethrough and projecting from at least one end thereof, the operation of which places the device in condition for another operation in a reversed position.



4. In a heat-cartridge, suitable terminals for connecting the cartridge in a circuit which it is to protect, a circuit-controlling operating member normally extending completely through the cartridge and in electrical connection with the said terminals, and means for operating the said circuit-controlling member to control a circuit and condition the cartridge for another operation in a reversed position.

5. In a device of the character described, an incased resistance member normally extending completely through the casing and operable longitudinally in either direction under abnormal current conditions, a support for the device, and means for operating the said resistance member and insulated therefrom, the said resistance member and casing constituting a device detachable from its support for reversal after each operation for a repetition thereof.

6. A thermal protector comprising a sleeve, supporting means therefor, a heat-producing pin extending completely through the sleeve, heat-susceptible material normally holding the pin in operative position, and suitable means for operating the pin to control a circuit and condition the device for another operation in a reversed position.

7. A thermal protector comprising a sleeve, end caps therefor, a heat-producing pin extending completely through the sleeve and end caps and projecting from at least one end cap, and heat-susceptible material normally securing the said pin to the said end caps.

8. In a thermal protector of the character described, the combination of an insulating-sleeve, end caps therefor, and a spring-pressed resistance member normally extending completely through the sleeve and end caps, being normally secured to the latter by heat-susceptible material, and operable longitudinally in either direction, relatively to the remainder of the protector, to control a circuit, when the heat-susceptible material is softened.

9. The combination with an electric circuit including at least one spring-support, of an incased resistance member supported by said spring-support, normally extending completely through its casing and operable in either direction under abnormal current conditions, heat-susceptible material normally holding the resistance member against operation, and a spring member for operating the said resistance member but insulated therefrom, the said incased resistance member constituting a detachable device capable of reversal after each operation for a repetition thereof.

10. In a thermal protector of the class specified, an insulating-casing, a conducting end cap for each end thereof and secured thereto, a pin of resistance material extending completely through said casing and end caps, a metallic plating for each end of said pin, and heat-susceptible material normally securing the said plated portions of said pin to the respective end caps.

11. In a thermal protector of the character described, an insulating-sleeve, a conducting end cap for each end thereof and secured thereto, a resistance member extending completely through the sleeve and end caps, arranged to generate heat under abnormal current conditions to operate the device, and operable longitudinally in either direction to render the device reversible, under abnormal conditions, and heat-susceptible material normally securing the said resistance member to the end caps.

12. A heat-cartridge of the character described, comprising a shell, a piece of homogeneous resistance material extending completely through the cartridge and operable in either direction under abnormal conditions, and heat-susceptible material normally holding the said piece of resistance material against operation.

18. A heat-cartridge of the character described comprising a shell, a piece of graphite normally extending completely through the shell and operable in either direction under abnormal current conditions to control a circuit and to render the device reversible for another operation, and heat-susceptible material normally holding the said graphite against operation.

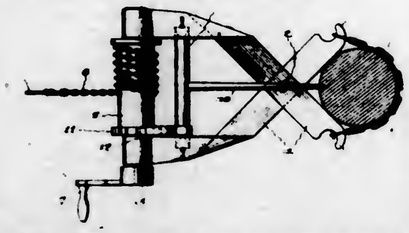
14. In a heat-cartridge of the character described, a heat-producing pin extending completely through the cartridge and operable endwise, and heat-susceptible material normally securing the pin in a fixed position.

15. In apparatus of the class specified, a ground-plate, a pair of springs mounted thereon, a heat-producing member electrically connected in circuit with the said springs and adapted to engage the ground-plate when the device operates, and means for operating the heat-producing member to bring same in contact with the ground-plate without opening the said circuit between the said springs.

16. In apparatus of the class specified, a ground-plate, a pair of springs mounted thereon, a heat-producing member electrically connected between the pair of springs, an alarm-spring mounted outside of the pair of springs and adapted to operate the heat-producing member under abnormal conditions and cause same to contact the ground-plate to ground the circuit, and a contact on the alarm-spring adapted to contact one of the pair of springs to close an alarm-circuit upon the operation of the device.

17. In apparatus of the class specified, a ground-plate, a pair of springs for each side of the ground-plate and suitably mounted thereon, a heat-cartridge for each pair of springs, comprising a heat-producing pin extending completely through the cartridge and electrically in circuit with the pair of springs, an alarm-spring for each side of the ground-plate and mounted outside of the pair of springs, said alarm-spring being insulated from said pin and provided with a contact adapted to engage one of the pair of springs when the device operates, and lightning-arresters inserted between the respective inner springs of the pairs and the ground-plate, abnormal current conditions in either heat-cartridge causing its corresponding alarm-spring to bring the heat-producing pin in contact with the ground-plate to ground the line-circuit, the said alarm-spring also closing the alarm-circuit, the heat-cartridge being reversible after operation for another operation thereof.

812,981. **WIRE-STRETCHER.** KENNETH CUNNINGHAM, Cheyenne, Okla. Filed Dec. 2, 1905. Serial No. 289,963.



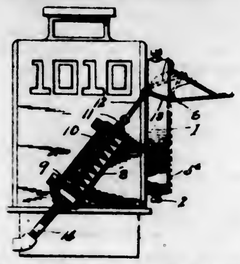
Claim.—1. In a fence-wire stretcher, crossed bars adapted to be secured to a post, and a roller journaled in said bars, substantially as shown and described.

2. In a fence-wire stretcher, crossed bars having hooks at one end, a flexible element adapted to engage said hooks, and a roller journaled in said bars, substantially as shown and described.

3. In a fence-wire stretcher, in combination with a fence post and wire, crossed bars having hooks at one end, a flexible element secured to said hooks and adapted to encircle the post, a roller journaled in said arms, a flexible element secured to said roller and adapted to be secured to the fence-wire, a bar secured to said crossed bar, and pointed bars secured to said bar and adapted to engage the post, substantially as shown and described.

4. In a fence-wire stretcher, in combination with a fence post and wire, crossed bars having hooks at one end, a flexible element secured to said hooks and adapted to encircle the post, a roller journaled in said arms, a crank-lever to actuate said roller, said roller being provided with ratchet-teeth, a flexible element secured to said roller and adapted to be secured to the fence-wire, a bar secured to said crossed bar, pointed bars secured to said bar and adapted to engage the post, and a gravity-pawl pivotally secured to said bar and adapted to engage the ratchet-teeth in the roller, substantially as shown and described.

812,982. **HEADLIGHT-COVER.** HARVEY M. DAVENPORT, Sheridan, Wyo. Filed Mar. 3, 1905. Serial No. 248,513.



Claim.—1. In a device of the character described, a band adapted to embrace and be secured about the bezel of a locomotive-headlight glass, a segmental cover permanently secured thereto, a movable cover hinged to the segmental cover and normally open, a cylinder, a piston disposed within the cylinder, a lever rigidly connected to the hinged cover, a link pivoted to the said lever and to the piston, a source of fluid-pressure, and means for admitting the fluid-pressure to the cylinder to close the said hinged cover.

2. In a device of the class described, the combination of a headlight, a source of fluid-pressure, a hinged cover adapted and arranged to be removably secured to the bezel of a headlight, and to be swung upward to uncover the light, a brace adapted to limit said upward movement, a cylinder attached to the headlight-body, a piston slidably mounted within the cylinder, a pivoted link connecting the piston and a rigid arm carried by the cover whereby the reciprocation of the piston opens and closes the cover, a spring mounted within the cylinder and disposed to hold the piston at the extreme of its movement, pipes connecting the cylinder and source of fluid-pressure, a valve disposed to admit fluid under pressure to the cylinder to move the piston and close the cover, and means to permit the escape of the air from the cylinder to permit the spring to act.

3. The combination with a headlight of a removable cover consisting of a band and means for securing said band to the bezel of said headlight, a cover hinged to the band and an arm to limit the swing of said cover, a cylinder and motive-fluid inlet thereto, a spring-pressed piston within the cylinder, a lever-arm attached to the hinged cover, and a link connecting said arm and the piston-stem.

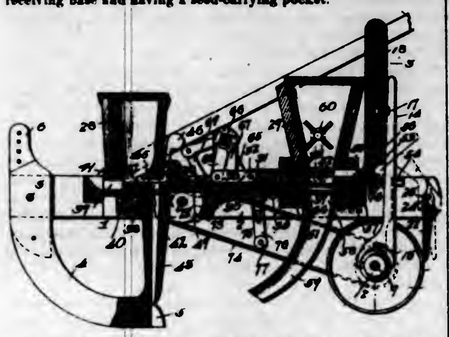
4. The combination with a headlight of a removable band and screws for securing said band to the bezel of the headlight, a cover over the band having a hinged portion, an arm projecting from the cover to limit the movement of the hinged portion, a cylinder secured to the headlight and connected with an air-drum, means for admitting air to said cylinder, a piston within the cylinder, a lever-arm attached to the hinged cover, and a link connecting said arm and the piston-stem.

5. The combination with a locomotive-headlight of a band and means for securing the same to the bezel of the light, a cover over the band having a stationary and a hinged portion, means for opening the hinged portion upward away from the light, and perforations in the stationary portion of the cover identifying the locomotive.

812,983. **COMBINED CORN-PLANTER AND FERTILIZER-DISTRIBUTER.** JOSEPH D. DAVIS, Pendleton, N. C., assignor of one-half to James H. Davis, Pendleton, N. C. Filed July 24, 1905. Serial No. 271,048.

Claim.—1. In a machine of the class described, the frame, a seed-hopper having a bottom seed-opening and a slide-receiving base, the latter having a spout connection therewith, a self-adjusting cut-off and feeder having a shoe portion lying partly within the opening in the bottom of the seed-hopper, a fertilizer-hopper having a delivery-spout connection therewith, and a suitably-reciprocated feeding-slide having dropping members coöperating with the fertilizer-hopper and a single dropping member operating in the slide-receiving base of the seed-hopper beneath the said cut-off and feeder.

2. In a machine of the class described, the frame, a seed-hopper having a bottom seed-feed opening and a slide-receiving base having a spout connection therewith, a self-adjusting weighted cut-off and feeder having a shoe loosely arranged within said base and provided with a nose portion disposed within the seed-feed opening of the hopper, and a suitably-operated feeding-slide working in said slide-receiving base and having a seed-carrying pocket.

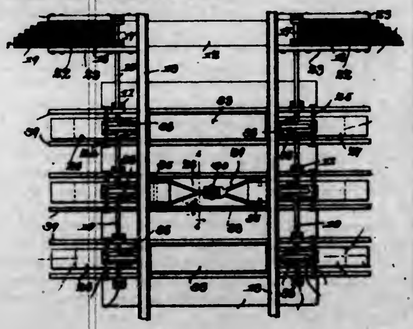


3. In a machine of the class described, the frame, a seed-hopper provided with a bottom seed-opening and a slide-receiving base having a spout connection therewith, a self-adjusting cut-off and feeder having a horizontal shoe portion loosely arranged within the slide-receiving base and an upright exterior weighted lever-arm rigid with said shoe portion, the latter being provided with a nose enlargement within the seed-feed opening of the hopper, and a suitably-operated feeding-slide working in said slide-receiving base and having a seed-carrying pocket.

4. In a machine of the class described, the frame, a seed-hopper mounted in the frame and provided with a slide-receiving base having a spout connection therewith, a fertilizer-hopper arranged in rear of the seed-hopper and provided with a horizontally-partitioned bottom feed-box provided with upper and lower slide-openings, the partition of said box being provided with a feed-opening and an adjustable regulating-gate having an exterior adjustment connection, and a suitably-operated reciprocating feed-slide having a perforated member working in the slide-receiving base of the seed-hopper, and a forked member consisting of an upper cut-off plate and a lower discharging-plate operating respectively in said upper and lower slide-openings of the feed-box, said lower discharging-plate being of greater length than the cut-off plate and having a dropping pocket or opening within the vertical plane of said cut-off plate.

5. In a machine of the class described, the frame, a seed-hopper and a fertilizer-hopper arranged one in advance of the other, a reciprocating feed-slide common to both of said hoppers and coöperating with the dropping means therefor, a rocking agitator arranged within the fertilizing-hopper, a rock-shaft having a rock-arm connection with the feed-slide and a similar connection with said rocking agitator, an operating-shaft journaled in the frame and carrying a crank-arm having a link-and-crank connection with said rock-shaft and carrying the belt-wheel, a drive-shaft carrying a fixed belt-wheel having a clutch member, a driving connection between the two belt-wheels, and a shiftable ground-wheel loosely mounted on the drive-shaft and having a clutch member for engagement with the complemental member of said driving-belt wheel.

812,984. **CATTLE-GUARD.** WALLACE B. DEMENT, Blaine, Wash. Filed Oct. 12, 1905. Serial No. 282,467.



Claim.—1. In a cattle-guard, an arm pivoted to swing into vertical position, a plurality of secondary arms pivoted at one end to said primary arm near the pivot of the same, a flexible element coupling the free ends of all of said arms, and means for operating said primary arm to carry said secondary arms over the center for projection by gravity into active position.

2. In a cattle-guard, an arm pivoted to swing into vertical position, a plurality of secondary arms pivoted at one end to said primary arm near the pivot of the same, a flexible element coupling the free ends of all of said arms, a vertically-movable trip-platform, and means whereby the motion of said platform is communicated to said primary arm.

3. In a cattle-guard, a rock-shaft, a primary arm connected to said shaft and movable therewith, a plurality of secondary arms pivoted to said primary arm near said shaft, a flexible element coupling the free ends of all of said arms, means for operating said shaft to carry said primary arm into vertical position and carry said secondary arms over the center for projection into active position.

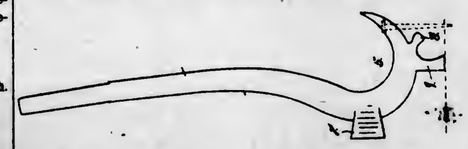
4. In a cattle-guard, a rock-shaft, a primary arm connected to said shaft and movable therewith, a plurality of secondary arms pivoted to said primary arm near said shaft, a flexible element coupling the free ends of all of said arms, a vertically-movable trip-platform, and means whereby the motion of said platform is communicated to said shaft.

5. In a cattle-guard, a rock-shaft, a support disposed adjacent to said shaft, a primary arm connected to said shaft and movable therewith and a plurality of secondary arms pivoted to said primary arm near said shaft and bearing upon said support when in open position, an arm swinging loosely upon said shaft, a flexible element connected at one end to said support and coupled consecutively to the free ends of said loosely-swinging arm, primary arm and secondary arms, and means for rotating said shaft to carry said primary arm into vertical position and carry said loosely-swinging arm and secondary arms into active position.

6. In a cattle-guard, a rock-shaft having one or more cranks, a primary arm connected to said shaft and movable therewith, a plurality of secondary arms pivoted to said primary arm near said shaft, a flexible element connecting the free ends of all of said arms, one or more vertically-movable trip-platforms disposed in the path of the approaching animal, and coupling means between said platforms and cranks, whereby the depression of the platforms will actuate the shaft and move the arms into active position.

7. In a cattle-guard, parallel shafts mounted for rotation and provided with spaced cranks, a primary arm connected to each of said shafts, a plurality of secondary arms swinging from each of said primary arms, flexible elements coupling all the arms of each of said shafts, levers disposed in pairs and pivoted intermediately and extending beneath said shafts, coupling means between each pair of said levers, platforms movably connected to each coupled pair of said levers, counterweights at the outer ends of said levers, and slotted members upon said levers and engaging said cranks.

812,985. **CLAW-HAMMER AND SPIKE-PULLER.** CHARLES P. FITCH, Boulder, Colo. Filed July 14, 1905. Serial No. 269,521.



Claim.—1. A tool provided with a handle merging into a curve of comparatively small radius, the curved part having a claw at one end and a hammer head or face at the other end, and a projection extending outwardly from the convex side of the curve and located between the claw and the hammer-head, the said projection consisting of two suitably separated members, the handle of the tool extending parallel or nearly so with the direction of the free end of the curved part.

2. A tool provided with a handle having a curved part at one end, the curved part having a claw at its free extremity, a hammer-face at its opposite extremity, and two projections differing in length and extending outwardly from the convex side of the curve, the two projections being located between the hammer-face and the claw and being suitably separated, the handle of the tool extending parallel or nearly so with the direction of the claw.

812,986. **DISPLAY-RACK.** CHARLES A. BELL, Wilkes-Barre, Pa. Filed Dec. 2, 1905. Serial No. 290,000.

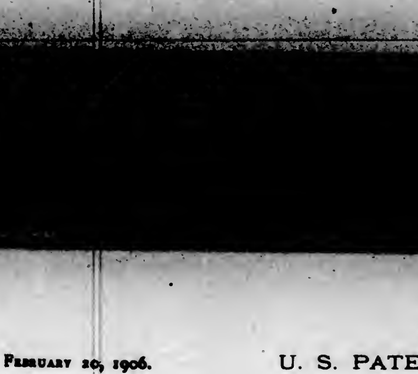
Claim.—1. In a display-rack, the combination with a base, of a standard pivoted thereto, a plurality of arms pivoted to said standard, a plurality of rods pivoted to said arms, and a plurality of hooks pivoted to said rods, substantially as described.

2. In a display-rack, the combination with a base, of a standard pivoted thereto, a plurality of arms pivoted to said standard, a plurality of rods pivoted to said arms, a plurality of hooks pivoted to said rods, and a plurality of stops on said rods, substantially as described.

3. In a display-rack, the combination with a base, of a standard pivoted thereto, a plurality of arms pivoted to said standard, a plurality of rods pivoted to said arms, a plurality of hooks pivoted to said rods, and a plurality of stops on said rods, said stops being adapted to limit the movement of said hooks, substantially as described.

4. In a display-rack, the combination with a base, of a standard pivoted thereto, a plurality of arms pivoted to said standard, a plurality of rods pivoted to said arms, a plurality of hooks pivoted to said rods, and a plurality of stops on said rods, said stops being adapted to limit the movement of said hooks, and said hooks being adapted to engage said stops, substantially as described.

812,987. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,102.



Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,988. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,103.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,989. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,104.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,990. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,105.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,991. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,106.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,992. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,107.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,993. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,108.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,994. **CAR-COUPLING.** ALEXANDER BOYD, Pittsburg, Pa. Filed Aug. 28, 1905. Serial No. 276,109.

Claim.—1. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, and a link connecting said pin and lug, substantially as described.

2. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, substantially as described.

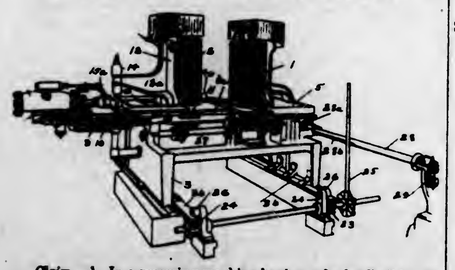
3. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, substantially as described.

4. In a car-coupling, the combination with a knuckle, of a lever pivoted thereto, a pin carried by said lever, a lug on said knuckle, a link connecting said pin and lug, and a guard-arm on said lever, said guard-arm being adapted to engage the knuckle-lug, and said lever being adapted to engage the knuckle-tail, substantially as described.

812,986. DISPLAY-FORM. GEORGE GALLAND, Wilkes-Barre, Pa., assignor to Minnie S. Galland, Wilkes-Barre, Pa. Filed May 15, 1905. Serial No. 260,470.

Claim.—The herein-described display-form comprising the flat figure representing the face and having side lines forming the outlines of the head, neck, shoulders, upper portions of the arms, bust and hips of a human figure, said side lines corresponding in size and shape and being equidistant from the vertical center of the form, and the flat flap on the rear side of the form, hinged to the center thereof, and having its outer edge corresponding to the side lines thereof.

812,987. RESAWING ATTACHMENT FOR BAND-SAWS. MICHAEL GARLAND, Bay City, Mich., assignor to The M. Garland Company, Bay City, Mich. Filed Jan. 28, 1904. Serial No. 190,962.



Claim.—1. In a resaw-machine having a feed-roll slide, capable of angular variations, the combination with the piston-rod pivotally connected to said slide; of a pivotally-mounted cylinder, and a piston therein, fixed to said rod, for the purposes set forth.

2. In combination with the sliding carriage and pressure-roll of a resaw-machine, a bracket mounted on said carriage and pivotally connected thereto near the bottom of said roll; a rearwardly-extending arm on said bracket; fixed cushions above and below said arm and adapted to limit its vertical movement; a cylinder having a fluid-actuated reciprocating piston, and means connecting said piston with said sliding carriage.

3. In combination with the movable pressure-roll carriage of a band-saw machine, a longitudinally-immovable cylinder having a fluid-actuated reciprocating piston, a piston-rod connecting said piston with said carriage; a two-part cross-head on said rod, the rear part of said cross-head being fixed to the rod and the forward part of said cross-head being slidably mounted on said rod; together with a cushion inserted between the parts of said cross-head, for the purposes set forth.

4. In a resaw-machine, the combination with the roll-carrying carriage capable of limited lateral movement at its rear end; of a pivotally-mounted cylinder having a fluid-actuated reciprocating piston; and a piston-rod fixed at one end to said piston and pivotally connected at its other end to the rear end of said carriage.

5. In a resaw-machine having a movable carriage and gage-rollers mounted thereon; a bar fixed at one end to said carriage and having a rack near its other end; a gear-wheel engaging said rack and adapted to actuate it back and forth; a lever adapted to rotate said gear-wheel; a quadrant; means for engaging the lever at different distances along the quadrant; and means for adjusting the quadrant lengthwise, for the purposes set forth.

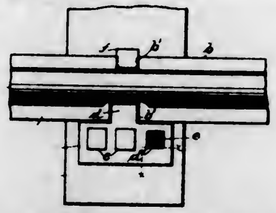
6. In a resaw-machine, the combination of a frame carrying adjustable pressure-rolls and a fluid-actuated engine for moving said rolls back and forth, and gage-rolls and means for operating them back and forth; together with tracks carrying said frame; racks on said frame, pinions engaging said racks and adapted to move said frame back and forth along the tracks, for the purpose set forth.

7. In a resaw-machine the combination with tracks of a frame movably mounted thereon, means for moving said frame, a carriage movable on said frame, a bracket pivoted to said carriage, pressure-rollers carried by said bracket, an arm on said bracket and cushions engaging said arm, a fluid-operated engine carried by the frame and connected to the carriage to actuate it back and forth; a second carriage movable on said frame; a bracket fixed to said carriage; gage-rollers carried by said bracket, a bar fixed to said carriage and having a rack; a gear mounted in said frame and engaging said rack, a lever for actuating said gear, a quadrant to engage said lever, means for securing said quadrant to said lever, and means for adjusting said quadrant lengthwise; all arranged substantially as and for the purposes set forth.

8. In a sawing mechanism, the combination with suitable ways, of a carriage loosely mounted thereon, rolls secured to the carriage and adapted to engage the work, the rolls being spaced apart from each other, and means interposed between the carriage and the ways to provide points of contact with the ways which guide the line of travel of the carriage while permitting it to slew on the ways to cause the equal engagement of the rolls with the work.

9. In a resawing-machine, the combination with a suitable frame and a saw, of a carriage, rolls supported by the carriage and engaging the material to be sawed, and gibs secured to the carriage and comprising rocker members adapted to engage the frame to permit a lateral movement of the carriage for the purpose of causing the rollers to squarely engage and accommodate themselves to the surface of the material.

812,988. RAILROAD-RAIL. EMILE C. GENEUX, Jeanerette, La. Filed Nov. 25, 1905. Serial No. 289,074.



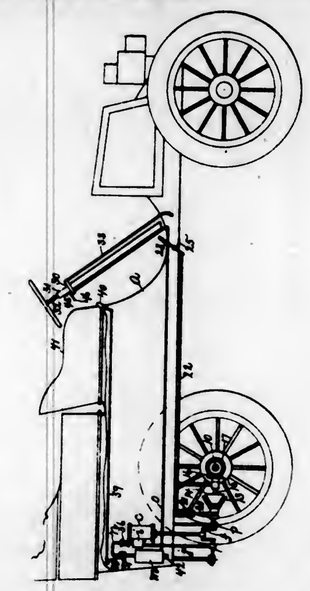
Claim.—A track-rail having base-flanges, a recess in a flange about the middle part of said rail, a cross-tie beneath said recess, an anchor-plate on said cross-tie at a side of said flange, a projection on said plate to engage said recess in said flange and holes in said plate through which spikes may be driven into said cross-tie, for the purpose specified.

812,989. POWER-BRAKE MECHANISM. CURTIS B. GOODE, Boston, Mass. Filed Jan. 4, 1905. Renewed Nov. 11, 1905. Serial No. 286,526.

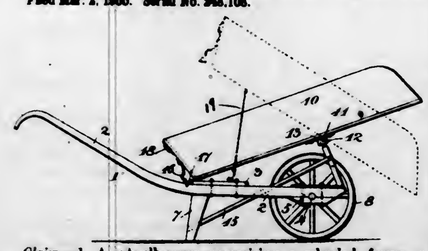
Claim.—1. The combination with a vehicle provided with a rotatable shaft, of an air-compressor carried by said vehicle and provided with an air-inlet port and with an exhaust-port independent of said air-inlet port, a piston in said compressor, a reservoir communicating with said exhaust-port, a valve controlling said air inlet and exhaust ports, mechanism for operating said piston from said shaft, mechanism for operating said valve from said shaft to admit compressed air from said reservoir into said compressor to obtain an initial rise in pressure within said compressor, which is increased by the movement of said piston in said compressor, and a valve to control the exhaust from said reservoir, for the purpose specified.

2. The combination with a vehicle, of a fluid-compressor carried thereby and driven from a moving member or part of said vehicle, a reservoir communicating with said compressor, a valve controlling communication between said reservoir and said compressor and operated from said driven member or part of said vehicle, to admit compressed fluid from said reservoir into said compressor to obtain an initial rise in pressure within said compressor, and means to control the exhaust of compressed fluid from said reservoir, substantially as described.

3. The combination with a movable member, of a fluid-compressor driven from said movable member, a reservoir communicating with said compressor, a valve controlling communication between said reservoir and said compressor and operated from said movable member to admit compressed fluid from said reservoir into said compressor to obtain an initial rise in pressure within said compressor, and means to control the exhaust of compressed fluid from said reservoir, substantially as described.



812,990. WHEELBARROW. WILLIAM GOSSETT, Falls City, Nebr. Filed Mar. 2, 1905. Serial No. 248,108.



Claim.—1. A wheelbarrow comprising a wheeled frame, a bracket upon said frame extending vertically above the wheel, a body, and a ball-and-socket connection between the body and the said bracket, at a point directly over the wheel, pivotally connecting the body to the bracket for universal angular movement to enable the body to be supported normally in an inclined position with one end resting on the frame or to be turned and tilted to any desired angle.

2. A wheelbarrow comprising a wheeled frame, a bracket upon said frame having a bearing ball or head disposed directly over said wheel, a body, a bearing-socket upon the bottom of said body and adapted to receive said bearing-ball, said socket being nearer to one end of said body than to its other end whereby one end of said body will be overbalanced.

812,991. RAILROAD-TIE. SAMUEL N. GRIFFITH, Chicago, Ill. Filed May 14, 1904. Serial No. 207,913.

Claim.—1. A railroad-tie comprising a metallic trough, and a pair of metal-bound blocks seated in said trough and adapted to receive the spikes employed in securing the rails in place, each block and its metal binding being removable as a unit from the balance of the structure.

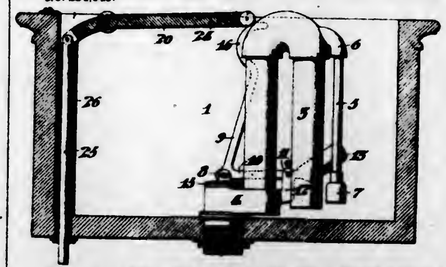
2. A railroad-tie comprising a longitudinal member, and metal-bound blocks secured to the opposite end portions of the said member, said blocks being adapted to receive the spikes employed in securing the rails in place, each block and its metal binding being removable as a unit from the balance of the structure.

3. A railroad-tie comprising a metal trough, metal-bound blocks of wood seated in the opposite end portions of said trough and bolts extending through the trough and blocks to hold the latter in place, each block and its metal binding being removable as a unit from the balance of the structure.

4. A railroad-tie comprising a metal trough, metal bands seated in said trough, blocks of wood inclosed by said bands, said blocks being in a position to receive the rails, and bolts extending through the trough, bands and blocks, to hold the latter in place.

5. A railroad-tie comprising a metal trough having its sides provided with ears, blocks seated in the trough between said ears, said blocks extending a suitable distance above the ears, and bolts extending through the ears and blocks to hold the latter in place.

812,992. FLUSHING APPARATUS FOR WATER-CLOSETS. WILLIAM U. GRIFFITHS, Philadelphia, Pa. Filed Nov. 25, 1904. Serial No. 234,145.



Claim.—1. A flush tank provided with a port, a siphon located in the said tank, and means for opening and closing the said port, the said means comprising a pivoted lever which is provided with a cam projection, a valve secured to the said lever and being movable with the said lever to open and close the said port, and a lever adapted to contact with and travel over the said cam projection.

2. A flush tank provided with a port, an angular lever located in the said tank, one portion of which lever is pivotally secured to a suitable support and the other portion of which is provided with a cam projection, a valve secured to the said lever and adapted to close the said port, and a pivoted lever having one of its ends adapted to contact with and to travel over the said cam projection.

3. A flush tank provided with a port, a lever comprising two arms arranged at an angle to each other, one of the said arms being pivotally secured upon a suitable support within the said tank and the other of said arms extending upwardly toward the top of said tank and being provided at its upper end with a cam projection, a valve secured to the said lever, and a pivoted lever having one of its ends adapted to contact with and travel over the said cam projection.

4. A flush tank provided with a port, a lever consisting of two parts arranged at an angle to each other, one of which is pivotally secured upon a suitable support within the said tank and which part has a weight at its extreme end to counterbalance the weight of the said lever, and the other of which parts is provided with a cam projection, a valve secured to the said lever, and a movable lever having one of its ends adapted to contact with and travel over the said cam projection.

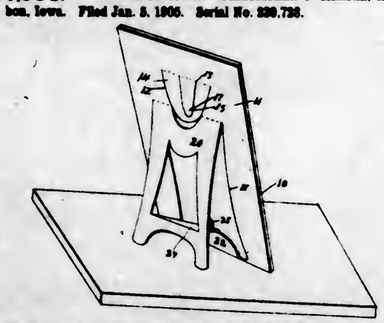
5. A flush tank provided with a port, a lever consisting of two arms arranged at an angle to each other, one of the said arms occupying a substantially horizontal position within the said tank and being pivotally secured upon a suitable support, and the said arm being extended beyond its point of support and provided with a weight, the other of the said arms extending upwardly toward the top of the

tank and being provided with a cam projection, a valve supported upon the said lever and adapted to close the said port, and a movable lever having one end adapted to contact with and travel over the said cam projection.

6. In an apparatus of the character described, a flush tank having a port, a siphon having communication with the flush pipe leading from the tank, a supporting arm secured to the said siphon, a lever comprising two arms arranged at an angle to each other, one of the said arms being pivotally secured upon the supporting arm and extended beyond its pivoted point, the extended portion thereof being provided with a weight, and the other arm of the said lever extending upwardly toward the top of the flush tank and being provided with a cam, a valve pivotally secured upon the said lever and adapted to close the said port, and a pivoted lever having one end adapted to contact with and travel over the said cam.

7. An apparatus of the character described, a flush tank provided with a port, and a siphon secured within the said tank and being in communication with a flush pipe, a siphon breaking device connected to the said siphon, a lever comprising two arms arranged at an angle to each other, one of the said arms being pivotally secured upon a suitable support within the said tank, and the other of said arms extending upwardly toward the top of the said tank and being provided with a cam, a valve secured to the said lever and being adapted to close the said port, and a pivoted lever having one end adapted to contact with and to travel over the said cam projection.

812,993. CARD-MOUNTING. CHRISTOPHER C. HARPER, Audubon, Iowa. Filed Jan. 5, 1905. Serial No. 239,736.



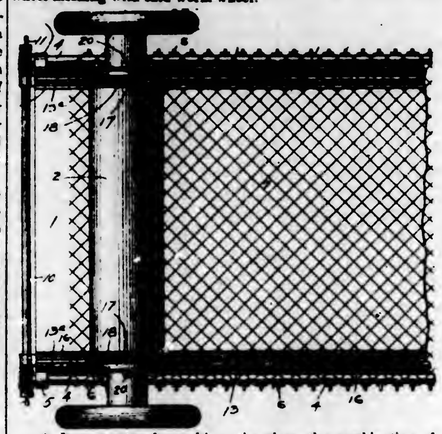
Claim.—In a card-mounting, a face-card, a flexible back-card having a leg formed therein by cutting through the card, said leg extending from a point near the top to a point near the bottom of the back-card and its lower end capable of swinging outwardly away from the face-card, said leg provided with a brace formed by cutting through the leg, said brace extending from a point near the bottom of the leg to a point near its top, the brace being capable of folding inwardly on a line near its lower end to position approaching a right angle relative to the leg, said brace formed with a tongue at its free end and said tongue formed with a handle, the part comprising said tongue and handle provided with a hinge connection with the brace, said back-card also formed with a locking-lug near its lower end extended upwardly from the bottom of the back-card at the central portion thereof, said locking-lug parallel with and free from the face-card to permit the introduction of the said tongue between it and the face-card and to retain it therein against displacement by pressure tending to move the leg and face-card away from each other, the margins of said front and back cards secured together.

812,994. APPARATUS FOR MAKING WIRE-GLASS. JOSEPH HEIDENKAMP, Springdale, Pa. Filed May 5, 1905. Serial No. 260,957.

Claim.—1. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, and securing means for the wire mesh at each side of said table and extending transversely to the roller-axis, one at least of said securing means being movable toward and from the edge of the table thereby to tighten the mesh.

2. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, and securing means for the wire mesh at each side of said table and extending transversely to the roller-axis, the securing means at one side at least being rotatable thereby to tighten said mesh.

3. In apparatus for making wire-glass, the combination of a casting-table and a roller coöperating therewith, securing means for the wire meshing at each side of said table and extending transversely to the roller-axis, the securing means at one side at least being a rotatable shaft, a worm-wheel on said shaft, and a driven worm-wheel meshing with said worm-wheel.



4. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, securing means for the wire mesh at each side of said table and extending transversely to the roller-axis, and means connecting said securing means and arranged to move the same simultaneously away from the table thereby to tighten the mesh.

5. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, a series of studs or hooks extending transversely to the roller-axis at each side of the table for the attachment of the wire mesh, and a movable bar to which at least one series of said studs is attached thereby to tighten said mesh.

6. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, a series of studs or hooks extending transversely to the roller-axis at each side of the table for the attachment of the wire mesh, and a rotatable shaft by which at least one series of said studs is carried.

7. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, a rotary shaft at one side of said table and extending transversely to the roller-axis, means for the attachment of the mesh to said shaft, and means for holding the opposite edge of said wire mesh.

8. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, a rotatable shaft at each side of the table and extending transversely to the roller-axis, means connecting said shafts and arranged to rotate the same simultaneously in opposite directions, and means for attaching wire mesh to said shafts.

9. In apparatus for making wire-glass, the combination of a casting-table and roller coöperating therewith, a rotatable shaft at each side of the table and extending transversely to the roller-axis, a driving-shaft geared to both of said side shafts and arranged to rotate the same in opposite directions, and means for attaching wire mesh to said side shafts.

10. In apparatus for making wire-glass, the combination of a casting-table provided with a groove near each side edge, holding means for wire mesh located at each side of the table outside of said grooves, bars adapted to be placed over said grooves and above the mesh, and a roller coöperating with the table and bearing on said bars.

11. In apparatus for making wire-glass, the combination of a casting-table provided with a groove near each side edge, securing means for the wire mesh located outside of said grooves, bars adapted to be placed over said grooves and above the mesh, and a roller coöperating with the table and provided with bearing-grooves traveling on said bars whereby to stretch the wire mesh and hold the roller squarely across the table.

12. In apparatus for making wire-glass, the combination of a casting-table provided with a groove near each side edge, means for securing wire mesh along one edge of the table outside the groove, a rotatable shaft on the opposite edge of the table outside the groove,

means for securing the wire mesh to said rotatable shaft, bars adapted to be placed over said grooves and above said mesh, and a roller coöperating with the table and bearing on said bars.

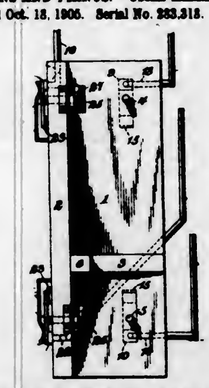
13. In apparatus for making wire-glass, the combination of a casting-table, cutting-shoulders on said table along both sides, securing means for the wire mesh located outside of said cutting-shoulders, a roller coöperating with said table, and cutting-disks on said roller coöperating with the cutting-shoulders on the table.

14. In apparatus for making wire-glass, the combination of a casting-table and coöperating roller, bars provided with cutting-shoulders placed along the edges of the table, securing means for wire mesh located outside of said bars, and cutting-disks on said roller coöperating with the shoulders on said bars.

15. In apparatus for making wire-glass, the combination of a casting-table provided with a groove near each side edge, changeable bars located inside of said grooves and adapted to support the wire-mesh and forming cutting-shoulders, securing means for the wire mesh located outside of said grooves, changeable bars adapted to be placed over said grooves and on top of the mesh, and a roller coöperating with the table and bearing on the last-named bars and having cutting-disks coöperating with the shoulders on the cutting-bars.

16. In apparatus for making wire-glass, the combination of a casting-table provided with a groove near each side edge, changeable bars located inside of said grooves and adapted to support the wire mesh securing means for the wire mesh located outside of said grooves, changeable bars adapted to be placed over said grooves and on top of the mesh, and a roller coöperating with the table and bearing on the last-named bars.

812,995. FOOT-RELEASE VALVE FOR PNEUMATIC ACTIONS FOR ORGANS AND PIANOS. OSCAR HERRMANN, Brown Station, N. Y. Filed Oct. 13, 1905. Serial No. 283,313.



Claim.—1. In a device of the class described, the combination of a foot-piece having a foot-receiving fulcrum and provided at opposite sides of the same with valves, and valve-actuating mechanism projecting from the foot-piece and arranged to be operated by the foot.

2. In a device of the class described, the combination of a foot-piece having a foot-receiving fulcrum and provided at opposite sides of the same with valves, and valve-actuating mechanism projecting from the foot-piece and embodying a reciprocatable plunger.

3. In a device of the class described, the combination of a foot-piece having a fulcrum, front and rear valves, and vertically-reciprocatable plungers mounted on the foot-piece and arranged to engage the valves.

4. In a device of the class described, the combination of a foot-piece having an upright fulcrum, and valve-operating mechanism arranged to be actuated by horizontal oscillatory movement of the foot and embodying horizontally-reciprocatable plungers.

5. In a device of the class described, the combination of a foot-piece having a foot-receiving fulcrum and provided at opposite sides of the same with valves, and valve-actuating mechanism projecting from the foot-piece and embodying a reciprocatable plunger, and a movable plate or member arranged to be engaged by the foot for actuating the plunger.

6. In a device of the class described, the combination of a foot-piece having a foot-receiving fulcrum and provided at opposite sides of the same with valves, and valve-actuating mechanism projecting from the foot-piece and embodying a reciprocatable plunger, and a plate or member hinged to the foot-piece and projecting therefrom at an angle.

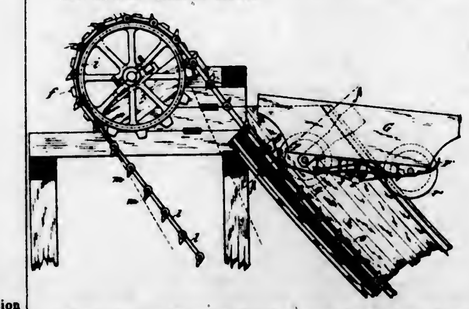
7. In a device of the class described, the combination of a foot-piece having a fulcrum and provided in advance and in rear of the same with upright and horizontal foot-receiving fulcrums, valves arranged in pairs, and valve-operating mechanisms embodying vertically and horizontally reciprocatable plungers.

8. In a device of the class described, the combination of a foot-piece provided with valves, a vertically-reciprocatable plunger engaging one of the valves and arranged to be directly operated by the foot, a horizontally-reciprocatable plunger engaging the other valve, and a movable plate or member arranged to be engaged by the foot for actuating the horizontally-reciprocatable plunger.

9. In a device of the class described, the combination of a foot-piece having horizontal and upright fulcrums, valves arranged in pairs, vertically and horizontally reciprocatable plungers arranged to engage the valves, the vertically-reciprocatable plunger being arranged to be directly engaged by the foot, and movable plates or members arranged to be engaged by the foot for actuating the horizontally-reciprocatable plungers.

10. In a device of the class described, the combination of a foot-piece having an upright supporting portion, a transverse fulcrum mounted on the foot-piece, an upright fulcrum arranged at the upright supporting portion, front and rear valves arranged in pairs, the members of each pair being located beneath the foot-piece and at the outer face of the upright supporting portion respectively, vertically-movable plungers guided on the foot-piece and engaging the valves beneath the same and arranged to be directly operated by the foot, horizontally-movable plungers engaging the valves of the upright supporting portion, and plates or members movably connected with the supporting portion and arranged to be engaged by the foot for actuating the horizontally-movable plungers.

812,996. GIANT SWING. THOMAS G. HILL, Portland, Oreg. Filed Nov. 10, 1904. Serial No. 232,061.

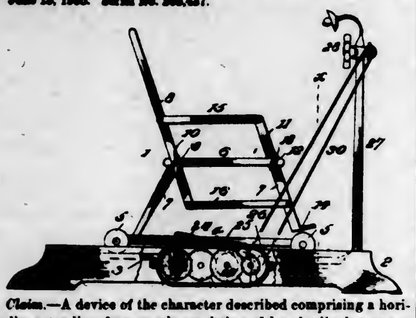


Claim.—1. A pleasure-railway comprising two tangential incline frames facing each other and having two continuous rail-tracks on their upper surfaces connected at the lower ends, one track of narrower gage being placed between the rails of the other, the ascending grade of one track increasing over that of the other such a percentage on each incline as will retain the car G in horizontal position to all places; below the track on each incline the motive mechanism consisting of the sprocket-wheels *f f'* and *g g'* suitably mounted, endless sprocket-chains *h h'* of suitable length, adapted to pass through the slotted grooves *o o'* the links *l l* being formed with the gripping-teeth *m m* passing through the slots and having friction-rollers *n n'*; a tripping-block E with sloping surface near the upper end of each incline, adapted to raise the grip-lever F of the car in gripping engagement; a car G having wheels gaged to run on the respective tracks and beneath it secured thereto, pivotally mounted automatic grip-levers F F' adapted to engage the teeth of the sprocket-chains and be raised by the tripping-block E, also having suitable means to catch and release the levers, also to retain them from dropping; and suitable motive mechanism with means to transmit the power, all substantially as described.

2. In a pleasure-railway the combination of two oppositely-placed tangential incline frames having continuous and connected tracks upon them, suitably arranged to retain the car G in horizontal position at all places; on each incline endless sprocket-chains suitably

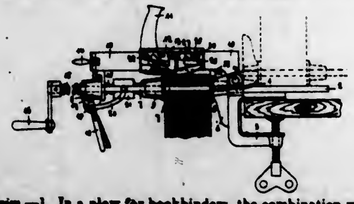
mounted and arranged, having gripping-teeth m m, adapted to engage the grip-levers F F' of a car; motive mechanism and means of transmitting the power to the sprocket-chains; a lever-tripping block H on each incline; and a car G having wheels gaged to run on the respective tracks and also having beneath it secured thereto, pivotally-mounted, automatic grip-levers F F' adapted to engage the teeth of the sprocket-chains and be raised by the tripping-block H and suitable latching, holding and releasing means for the levers, all substantially as described.

812,997. MOTOR-CHAIR. JOHN A. HIBBURD, Troy, Ala. Filed June 15, 1905. Serial No. 265,457.



Claim.—A device of the character described comprising a horizontally-extending framework consisting of longitudinal runners, an intermediate longitudinal runner or bar and cross-bars connecting the same, longitudinally-extending rails carried by the two outside longitudinal runners or bars, a chair provided with a bottom frame 4 having supporting-rollers at its ends mounted on said rails, a motor, a casing for said motor, said casing being secured to and carried by the intermediate longitudinal bar, a train of gearing mounted in said casing and operatively connected with the shaft of said motor, bracket-lugs 26 projecting downwardly from the bottom frame of the chair, a pitman connected at one end to said lugs, and a crank operatively connecting said pitman with the said train of gearing, as and for the purpose set forth.

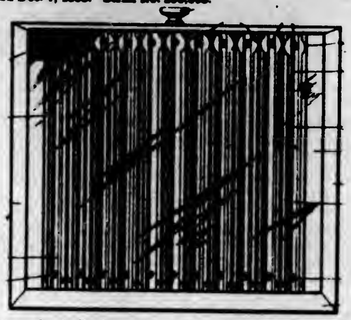
812,998. PLOW FOR BOOKBINDERS. JOHANNES HINKLEIN, Frankfort-on-the-Main, Germany, assignor to The Firm of Maschinenhandlung von Max Stern & Co., Frankfort-on-the-Main, Bockenheim, Germany. Filed May 11, 1904. Serial No. 207,486.



Claim.—1. In a plow for bookbinders, the combination with a stationary and a movable cheek adapted to clamp in the folded and collected sheets of paper; means for holding said cheeks; a slide adapted to be moved above the back of the paper and across to the same; a laterally-displaceable guide for said slide; a knife-holder attached to said slide, and an exchangeable knife attached to said holder; a pivot upon which the said holder may turn; a recess in the holder having upwardly-extending elongations of different heights; a horizontally-displaceable pin located in the slide and adapted to take in any of said elongations; and a spring adapted to keep the holder and knife in working position, substantially and for the purpose as described.

2. In a plow for bookbinders, the combination with a stationary and a movable cheek adapted to clamp in the folded and collected sheets of paper; means for holding said cheeks; a slide adapted to be moved above the back of the paper and across to the same; a handle fixed to said slide; a laterally-displaceable guide for said slide; a vertically-adjustable knife attached to the said slide, an abutment fixed to the guide and adapted to retain the paper at the place where the knife is pushed through the same, substantially and for the purpose as described.

812,999. DISPLAY-TRAY. JACOB J. HOFFMANN, Jersey City, N. J. Filed Dec. 7, 1905. Serial No. 290,969.

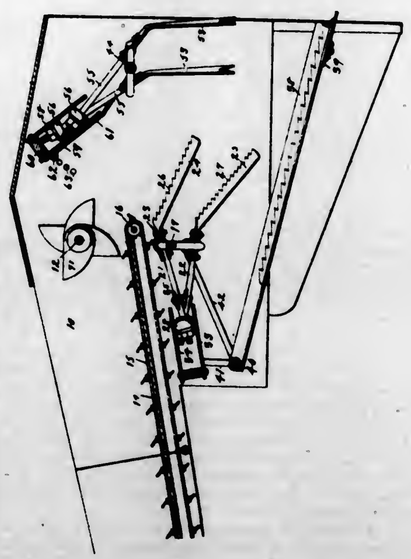


Claim.—1. A display-support for collar-buttons or the like comprising a base, a plurality of channel-guides arranged in parallel relation upon said base and having their side edges bent upwardly and inwardly to overhang their bottoms, said side edges being bent downwardly to close one end of said guide and having formed in them at opposite points, at the other end of said guide, recesses to permit of the insertion and removal of buttons or the like to and from said guide, and means for securing said guides upon said base.

2. A display-support for collar-buttons or the like comprising a box or casing having a transparent cover, a sliding drawer or tray in said casing, and a plurality of channel-supporting guides for collar-buttons or the like secured in parallel relation upon the upper face of said tray.

3. A display-support for collar-buttons or the like comprising a box or casing having a transparent cover, a sliding drawer or tray in said casing, and a channel-supporting guide for collar-buttons or the like secured upon the upper face of said tray and having its side edges bent upwardly and inwardly to overhang its bottom, said side edges being pressed downwardly at one end of the guide to close the same and being formed at the opposite end of the guide with recesses to permit of the insertion and removal of buttons to and from said guide, substantially as shown and described.

813,000. BAND-CUTTER AND FEEDER. LARS N. HOLM, Bryant, S. D. Filed Apr. 26, 1904. Serial No. 204,726.



Claim.—1. In a feeder, the combination of a frame, a shaft rotatably mounted in the frame and having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft and a distributing-arm mounted on the crank-arm.

2. In a feeder, the combination of a machine-frame, a rotatable shaft mounted therein and having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a distributing-arm mounted on the crank-arm and an adjustable guide for the distributing-arm.

3. In a feeder, the combination of a frame, a rotatable shaft mounted in the frame and having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a distributing-arm on the crank-arm, a roller on the distributing-arm and a guide for the roller.

4. In a feeder, the combination of a frame, a rotatable shaft mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a number of distributing-arms mounted on the crank-arm and a guide for said distributing-arms.

5. In a feeder, the combination of a frame, a rotatable shaft mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a number of distributing-arms mounted on said crank-arm, an adjustable guide for said distributing-arms and means for connecting the distributing-arms with each other.

6. In a feeder, the combination of a frame, a rotatable shaft mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted on the crank-arm, means for holding two adjacent ends of said distributing-arms spaced apart and a guide for said arms.

7. In a feeder, the combination of a frame, a shaft rotatably mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted on the shaft and a coupling-rod pivotally connected with both distributing-arms.

8. In a feeder, the combination of a machine-frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted on the shaft and a coupling-rod connected to both of said arms and capable of universal movement relative to each arm.

9. In a feeder, the combination of a frame, a shaft rotatably mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a number of distributing-arms pivoted to the crank-arm, means for connecting said distributing-arms with each other and an adjustable guide for said distributing-arms.

10. In a feeder, the combination of a machine-frame, a shaft rotatably mounted in the machine-frame and having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a number of distributing-arms mounted on the crank-arm, means for connecting the adjacent ends of said distributing-arms, a roller on each distributing-arm and a guide to receive said rollers.

11. In a feeder, the combination of a frame, a shaft rotatably mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted on the crank-arm, a roller on each distributing-arm and a guide comprising two plates supported by the frame and spaced apart to receive said rollers between them.

12. In a feeder, the combination of a frame, a shaft rotatably mounted in the frame and having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted upon the crank-arm, a ball-bearing roller on each distributing-arm and a guide comprising two plates spaced apart supported by the frame and having said ball-bearing rollers inserted between them.

13. In a feeder, the combination of a frame, means supported by the frame for advancing a layer of stock, a rotatable shaft mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted upon said crank-arm beneath the stock-advancing means one end of each distributing-arm inclined downwardly and toward the delivery end of the frame and having its top edge serrated, the other end of each arm projected in opposite directions and a guide for the latter ends of the distributing-arms.

14. In a feeder, the combination of a frame, a rotatable shaft mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, two distributing-arms mounted on the crank-arm, each having one end projected downwardly and forked and each also having its other end projecting upwardly and rearwardly, and a guide for the upper end of said distributing-arms.

15. In a feeder, the combination of a frame, a shaft rotatably mounted in the frame having a crank-arm arranged at an acute angle relative to the shaft, means for rotating the shaft, a distributing-arm mounted on the crank-arm having one end extended downwardly and forked and its other end extended upwardly and rearwardly, and a guide supported by the frame arranged parallel with the shaft and receiving the upper end of the distributing-arm.

16. In a feeder, the combination of a frame, means supported by the frame for advancing a layer of stock, means for operating said stock-advancing means, a rotatable shaft supported by the frame beneath the stock-advancing means, means for rotating said shaft, a number of crank-arms formed on said shaft each arranged at an acute angle relative to the shaft, two distributing-arms mounted on each of said crank-arms, each distributing-arm having one end inclining downwardly and toward the delivery end of the machine and positioned to engage the under surface of a layer of stock discharged from the stock-advancing means and each having its other end extended in an opposite direction in a substantially horizontal plane, a guide substantially parallel with the shaft to receive the latter-mentioned ends of the distributing-arms, a second shaft rotatably mounted in the frame above the stock-advancing means and having a number of crank-arms arranged at acute angles relative thereto, means for rotating said shaft, two distributing-arms mounted on each of said crank-arms, each distributing-arm having one end inclined downwardly toward the stock-advancing means and the other end inclined upwardly and away from the delivery end of the machine, and a guide substantially parallel with said shaft for receiving the upwardly-extending ends of said distributing-arms, said latter set of arms arranged to engage the top of a layer of stock on the stock-advancing means.

17. In a feeder, the combination of a frame, means supported by the frame for advancing bundles of stock, a shaft mounted in the frame above the bundle-advancing means, means for rotating said shaft, and a knife fixed to the shaft and comprising a body portion formed with two loops arranged at divergent angles relative to each other, a blade portion formed with projections to enter said loops and a lock for securing the blade portion to the body portion.

18. In a feeder, the combination of a frame, means supported by the frame for advancing bundles of stock, a shaft mounted in the frame above the bundle-advancing means, means for rotating said shaft, a knife fixed to said shaft comprising a body portion formed with two loops arranged nearly at right angles to each other, a blade portion having projections arranged nearly at right angles to each other to enter said loops and a lock for securing the blade to the body portion.

19. In a feeder, the combination of a frame, means supported by the frame for advancing bundles of stock, a shaft mounted in the frame above the bundle-advancing means, means for rotating said shaft, a knife fixed to said shaft and comprising, a body portion formed with two loops and a hook, a blade portion formed with two projections to enter said loops and formed with an opening to receive said hook, and a lock on the body portion to engage the blade portion and hold it against the hook.

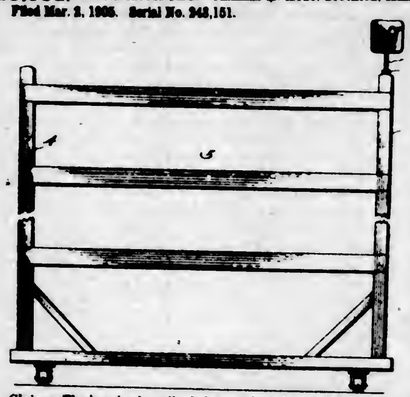
20. In a feeder, the combination of a frame, means supported by the frame for advancing bundles of stock, a shaft mounted in the frame above the bundle-advancing means, means for rotating said shaft, a knife on the shaft comprising a body portion formed with two loops and a hook, a blade portion formed with projections to enter the loops and also formed with an opening to receive the hook, and a lock pivoted to the body portion projected through a slot in the body portion and shaped to engage a part of the blade portion and hold it against said hook.

21. In a feeder, the combination of a frame, means supported by the frame for advancing bundles of stock, a shaft mounted in the frame above the bundle-advancing means, means for rotating said shaft, a knife fixed to the shaft comprising a body portion formed complete of a single piece of sheet metal and having two loops arranged nearly at right angles to each other and also having a hook, a blade portion formed complete of a single piece of sheet metal having two projections nearly at right angles to each other to enter said loops and also having an opening to receive said hook, and a lock attached to the body portion to engage one edge of the blade portion and hold it firmly against said hook.

22. In a feeder, the combination of a frame, means supported by the frame for advancing bundles of stock, a shaft mounted in the frame above the bundle-advancing means, means for rotating said

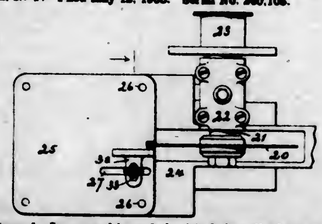
shaft, a knife fixed to the shaft comprising a body portion formed complete of a single piece of sheet metal and having one straight edge provided with a loop near one corner, a loop near the center of said straight edge nearly at right angles to the first and a hook near the other end of said straight edge extended inwardly toward the center of the body portion, a blade portion formed complete of a single piece of sheet metal having near one edge a rounded projection to enter the first loop, a second projection to enter the second of said loops, an opening to receive the said hook, and a lock pivoted to one surface of the body portion extended upwardly through a slot in the body portion and having its free end projected in a direction toward the hook.

813,001. SHOE-RACK TAG. CHARLES H. HOLT, Brockton, Mass. Filed Mar. 2, 1905. Serial No. 248,151.



Claim.—The herein-described shoe-rack and marking-tag therefor, consisting of a rack having upwardly-projecting corner-posts, a socket formed in said corner-posts, and a metal tube fitted therein, and a marking-tag consisting of a supporting-rod having a flattened upper portion, a sheet-metal tag-plate riveted to said flattened upper portion, a sheet-metal tag-plate riveted to said flattened upper portion of said rod and provided with a designating mark or number, the lower end of said rod being round and blunt or unpointed, and adapted to be placed in the metal tube in the corner-post, essentially as described.

813,002. GAGE FOR IVORY-NUT SAWS. JOHN HORNBY, New York, N. Y. Filed May 12, 1905. Serial No. 260,108.



Claim.—1. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane of the saw and having between them a recess.

2. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane, having between them a recess, and provided with means for varying the distance between the edges.

3. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane, having between them a recess, and provided with means for varying the distance between the plane of said edges and the said cutting-plane.

4. In a machine of the kind described, a gage for an ivory-nut saw, said gage being constructed to provide for two edges in a plane parallel to the cutting-plane, having between them a recess, and comprising a base member having one of said edges, an upper member having the other of said edges and adjusting means connecting said members with each other.

5. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane, having between them a recess, and provided with means for varying the distance between the plane of said edges and the said cutting-plane, comprising a transverse slot in the base of the gage and a bolt adapted to pass through the slot to secure the gage in position.

6. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane of the saw and having between them a recess, in combination with a base-plate in a plane at an angle to the cutting-plane.

7. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane of the saw and having between them a recess, in combination with a base-plate in a plane at an angle to the cutting-plane, and means for varying the distance between the said edges.

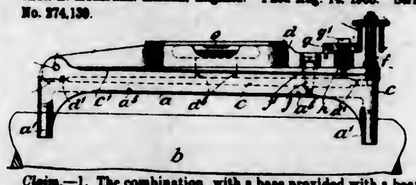
8. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane of the saw and having between them a recess, in combination with a base-plate in a plane at an angle to the cutting-plane, provision being made for varying the distance between the said edges, one edge being carried by a separable upper member connected to the base of the gage by screws or bolts.

9. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane of the saw and having between them a recess, in combination with a base-plate in a plane at an angle to the cutting-plane and provided with means for varying the distance between the plane of said edges and the said cutting-plane.

10. In a machine of the kind described, a gage for an ivory-nut saw provided with two edges in a plane parallel to the cutting-plane of the saw and having between them a recess, in combination with a base-plate in a plane at an angle to the cutting-plane and provided with means for varying the distance between the plane of said edges and the said cutting-plane, comprising a slot in the base-plate connected to the supporting means for the gage by screws or bolts.

11. In a machine of the kind described, a gage for an ivory-nut saw provided with two guiding edges in the same vertical plane and recessed between them away from the plane of the saw.

813,008. APPARATUS FOR ASCERTAINING ERRORS IN THE ALINEMENT OF SHAFTING AND FOR LIKE PURPOSES. ARTHUR B. HORSFALL, Halifax, England. Filed Aug. 14, 1905. Serial No. 274,130.



Claim.—1. The combination, with a base provided with a bearing-surface on its under side, of a bar arranged above the said base and provided with a sharp edge at one end which rests pivotally on the upper surface of the base, a loose connection which permits the said bar to slide to a limited extent upon the base, a level carried by the said bar, and a screw which adjusts the other end portion of the said bar vertically with relation to the said base.

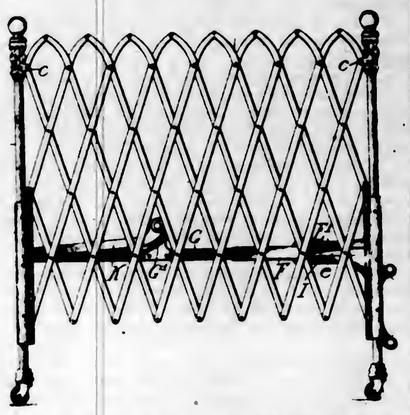
2. The combination, with a base provided with a bearing-surface on its under side, of a bar supported by the said base and provided with a level, an indicating-screw which moves one end portion of the said bar vertically, a toothed indicating-disk journaled adjacent to the said screw, and a projection carried by the said screw and engaging with the said disk.

3. The combination, with a base provided with a bearing-surface on its under side, of a bar supported by the said base and provided with a level, an indicating-screw which moves one end portion of the said bar vertically, a toothed indicating-disk journaled adjacent to the said screw, a friction brake device which prevents the said disk from being revolved accidentally, and a projection carried by the said screw and engaging with the said disk.

813,004. FOLDING BED. FREDERICK J. HUBBARD, Detroit, Mich., assignor to William B. Partridge and Henry Blackwell, Detroit, Mich. Filed Apr. 10, 1905. Serial No. 254,704.

Claim.—1. In a folding bed, the combination with relatively movable front and rear frames connected by lazy-tongs, of a vertically-swinging mattress-support having end bars shiftingly fulcrumed on the said rear frame, and links connecting the said end bars pivotally with the said front frame.

2. In a folding bed, the combination with relatively movable front and rear frames connected by lazy-tongs, of a vertically-swinging mattress-support having end bars shiftingly fulcrumed near their transverse centers on the said rear frame, links connecting the said end bars pivotally with the said front frame, catch mechanism operating automatically to lock the mattress-support, when in its horizontal position, against closing movement, and catch-releasing means.



3. In a folding bed having frames which slide toward and away from each other in the folding and unfolding operations, a vertically-swinging mattress-support having parallel bars slidably fulcrumed near their transverse centers on sliding bearing-supports on one of the said frames.

4. In a folding bed, the combination with relatively movable front and rear frames connected by lazy-tongs, of a vertically-swinging mattress-support having end bars slidably fulcrumed near their transverse centers on sliding bearing-supports on the said rear frame.

5. In a folding bed, the combination with relatively movable front and rear frames connected by lazy-tongs, of a vertically-swinging mattress-support having end bars connected by swinging links with the front frame and shiftingly fulcrumed near their transverse centers on the rear frame.

6. In a folding bed, the combination with relatively movable front and rear frames connected by lazy-tongs, of a vertically-swinging mattress-support having end bars connected by swinging links with the front frame and slidably fulcrumed near their transverse center on sliding bearings on the rear frame.

7. In a folding bed, the combination with relatively movable front and rear frames, of a vertically-swinging mattress-support having end bars connected by swinging links toward opposite sides with the front and rear frames, and slidably fulcrumed near their transverse centers on sliding bearing-supports on the said rear frame.

8. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs and relatively sliding front and rear foot-posts similarly connected, of a swinging mattress-support having end bars shiftingly fulcrumed near their transverse centers on the said rear posts and swinging link connections between the said bars and the said front posts.

9. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs and relatively sliding front and rear foot-posts similarly connected, of a swinging mattress-support having end bars shiftingly fulcrumed near their transverse centers on the said rear posts, and swinging link connections between the said bars and the said front and rear posts at opposite sides of the end-bar fulcrums.

10. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs and relatively sliding front and rear foot-posts similarly connected, of forward-extending arms upon the said posts, and a vertically-swinging mattress-support having end bars slidably fulcrumed near their transverse centers upon the said arms.

11. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs, and relatively sliding front and rear foot-posts similarly connected, of forward-extending arms upon the said rear posts, sliding bearing extensions on the said arms, and a vertically-swinging mattress-support having end bars fulcrumed near their transverse centers upon said bearing extensions.

12. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs, and relatively sliding front and rear foot-posts similarly connected, of forward-extending arms upon the rear posts, sliding bearing extensions on the said arms, and a vertically-swinging mattress-support having end bars slidably fulcrumed near their transverse centers upon said bearing extensions.

13. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs, and relatively sliding front and rear foot-posts similarly connected, of forward-extending arms upon the rear posts, a vertically-swinging mattress-support having end bars fulcrumed near their transverse centers upon said arms, and link connections between the said end bars and the front and rear posts.

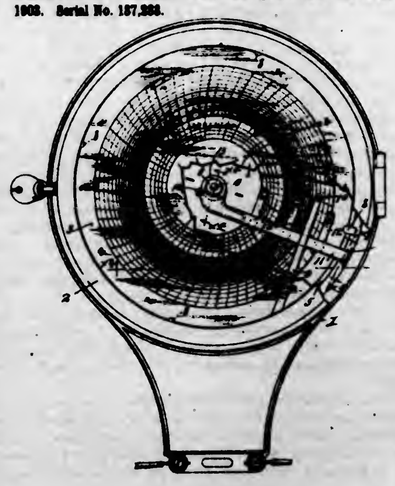
14. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs, and relatively sliding front and rear foot-posts similarly connected, of forward-extending arms upon the rear posts, sliding bearing extensions on the said arms, a vertically-swinging mattress-support having end bars fulcrumed near their transverse centers upon said bearing extensions, and link connections between the said end bars and the said front and rear posts.

15. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs, and relatively sliding front and rear foot-posts similarly connected, of forward-extending arms upon the rear posts, sliding bearing extensions on said arms, a vertically-swinging mattress-support having end bars slidably fulcrumed near their transverse centers upon said bearing extensions, links pivotally connecting the end bars in rear of their fulcrums with the said rear posts, and links pivotally connecting the forward end portions of said end bars with the said front posts.

16. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs, and relatively sliding front and rear foot-posts similarly connected, of slotted guide-sleeves on the rear posts for the lazy-tongs, forward-extending arms on the said sleeves, and a vertically-swinging mattress-support having end bars fulcrumed near their transverse centers upon the said arms.

17. In a folding bed, the combination with relatively sliding front and rear head-posts connected by lazy-tongs and relatively sliding rear and front foot-posts similarly connected, of slotted guide-sleeves on all of said posts for the lazy-tongs, forward-extending arms upon the rear-post sleeves, and a vertically-swinging mattress-support having end bars fulcrumed near their transverse centers upon said arms, links connecting the said end bars in front of their fulcrums with the said front-post sleeves, and links connecting the said end bars in rear of their fulcrums with the said rear-post sleeves.

813,005. PAPER-PRESSING ATTACHMENT FOR RECORDING INSTRUMENTS. CHARLES HULT, Minneapolis, Minn. Filed Dec. 31, 1903. Serial No. 187,288.



Claim.—In an instrument of the character described, the case 1 having the retaining-lug 14, the rotating stem 4 screw-threaded at its outer end and having a nut 6 with groove 17, the record-carrying disk 5 clamped to said stem 4, by said nut 6, and the automatically-vibrated arm 9 having the pen or stylus 10, in combination with the detachable bar 11 interlocking at its free end with said lug 14 and provided at its inner end with the hub 13 and spring 15, said hub fitting over said nut 6 and said spring engaging with said groove 17 thereof, and the plurality of spring-fingers 12 on said bar 11, for pressing a paper recording-chart against the said rotary carrying-disk, substantially as described.

818,006. **RAILROAD-TIE.** JOHN B. JOHNSON, Mount Vernon, S. D. Filed Nov. 2, 1905. Serial No. 285,697.

Claim.—1. The combination of a railroad-tie, sockets embedded therein and provided with projecting teeth or arms, and rail-clamping members fitting within the sockets.

2. The combination of a railroad-tie, interiorly-threaded sockets embedded therein and provided with externally-projecting arms or teeth, and a rail-clamping bolt fitting within the socket.

3. The combination of a railroad-tie formed of plastic material, sockets embedded therein and provided with externally-projecting arms or teeth, and rail-clamping members fitting within the sockets.

4. The combination of a railroad-tie formed of plastic material, internally-threaded sockets embedded therein, angular teeth projecting from the exterior of the sockets, and rail-clamping bolts fitting within the sockets.

5. The combination of a railroad-tie formed of plastic material, internally-threaded sockets embedded therein and extending entirely through the tie and having their lower ends closed, angular teeth projecting from the exterior of the sockets, and rail-clamping bolts fitting within the sockets, the heads of said bolts having their upper portions faceted while their base is provided with an annular flange.

818,007. **VOTING-MACHINE.** CHARLES E. KNEBOUGH, Logansport, Ind. Filed May 9, 1905. Serial No. 259,865.

Claim.—1. In a voting-machine, the combination of a wheel, a hollow shaft concentric with the hub of said wheel, plungers correspondingly arranged with relation to said shaft and hub of the wheel and which shaft is common to all of said plungers, and means for moving the said shaft endwise to prevent rotation of the wheel to lock and release and control said wheel, as set forth.

2. In a voting-machine, a wheel with a hub with openings, a hollow shaft with an opening, plungers movable radially of said wheel for cooperating with said shaft and hub, said openings being in position to receive the plungers and registering devices operatively connected with said plungers.

3. In a voting-machine, a wheel with a hub with openings, a hollow shaft with an opening, plungers movable radially on the wheel, said openings being in position to receive said plungers and means for automatically locking the plungers in their depressed position.

4. In a voting-machine, the combination of a wheel having a hub with openings, a hollow shaft with an opening, plungers movable radially on said wheel, said openings being in position to receive said plungers, means for automatically locking the plungers in their depressed position, and means for releasing said plungers.

5. In a voting-machine, the combination of a wheel, an endwise-movable hollow shaft concentric therewith a plunger movable radially thereon, means for automatically locking the plunger in its depressed position, means for releasing the plunger, and means for locking the machine against actuation.

6. In a voting-machine, a hollow rocking shaft, means for rotating said shaft and for moving it endwise a wheel carried thereon, and means coöperating with said shaft for controlling the kind of ticket voted.

7. In a voting-machine, plungers, a wheel, an endwise-movable shaft with which said plungers coöperate, and counting mechanism actuated by said plungers.

8. In a voting-machine, mechanism representing the different candidates for the different offices separate and distinct from each other, a series of plungers, a series of wheels, and a hollow shaft, said shaft and the wheel-hubs constructed for locking out some of said plungers by direct coöperation therewith.

9. In a voting-machine, a wheel, plungers thereon, an endwise-movable hollow shaft concentric with the hub of said wheel and common to all of the plungers and constructed for locking out some of the latter mechanism for voting the different tickets and counting mechanism representing the different candidates entirely separate and distinct.

10. In a voting-machine, a wheel, an endwise-movable shaft carrying the wheel, plungers movable radially on said wheel, means for automatically locking the plungers in their depressed position, and means for moving the shaft endwise to prevent actuation of said wheel.

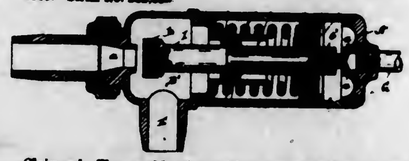
11. In a voting-machine, an endwise and rotatably movable shaft, a plurality of wheels carried thereby, means for moving the shaft about its axis, and means for moving the shaft endwise to prevent rotation of the wheels.

12. In a voting-machine, a wheel, an endwise-movable shaft, plungers and registering mechanism for each plunger, said shaft being common to all of the plungers, means for locking out some of the plungers and means common to said shaft and wheel for locking the plungers in their depressed position.

13. In a voting-machine, a wheel, plungers movable thereon, registering devices for each plunger, directly connected therewith and operated thereby, means for locking the wheel against rotation, and means for moving the shaft of the wheel endwise with relation to the hub of the wheel.

14. In a voting-machine, a wheel and simultaneously-operated plunger and registering mechanisms for polling a vote and counting the same, an endwise-movable hollow shaft on which said wheel is mounted, means for locking out some of said plungers when said shaft has been shifted, and means for locking the machine against operation.

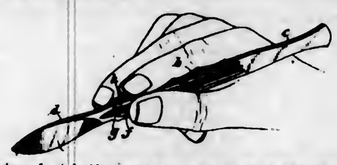
818,008. **PUMPING APPARATUS.** HUGH W. KIMM, Dayton, Ohio, assignor to Valle & Kimm, Dayton, Ohio, a Firm. Filed Oct. 9, 1905. Serial No. 282,602.



Claim.—1. The combination with a motor-fluid chest and a pump-chamber of a valve-casing, provided with a motor-fluid inlet and outlet, and a valve mounted upon a differential piston-rod journaled in said casing, a differential piston mounted on said rod, differential cylinders for said pistons, the larger piston area having pressure connections with the pump-chamber, and the smaller piston having fluid connections with the motor-fluid chest and supply-main, and a valve-seat in the casing in line with said valve, substantially as described.

2. The combination with a motor-fluid chest and a pump-chamber of a valve-casing, provided with a motor-fluid inlet and outlet, and a valve mounted upon a differential piston-rod journaled in said casing, a differential piston mounted on said rod, differential cylinders for said pistons, the larger piston area having pressure connections with the pump-chamber, and the smaller piston having fluid connections with the motor-fluid chest and supply-main, a valve-seat in the casing in line with said valve, and a compression-spring applied to the larger piston and tending to open the valve, substantially as described.

818,009. **KNIFE.** RICHARD KEY, Brooklyn, N. Y. Filed July 20, 1905. Serial No. 271,728.

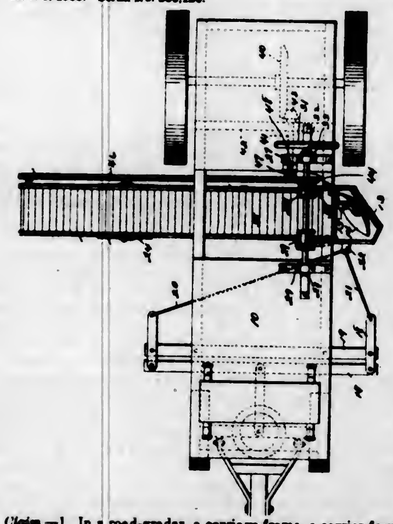


Claim.—1. A knife comprising a blade and handle formed of a single piece of metal, the handle having a central longitudinal rib projected out of the general plane of the metal on one side, and two outer longitudinal ribs on the opposite side.

2. A knife comprising a blade and handle formed of a single piece of metal of substantially regular thickness, the blade at the back being substantially of the thickness of the original metal, and the handle joining the blade and formed with alternating oppositely-faced longitudinal corrugations.

3. A surgeon's knife comprising a blade and handle formed of a single piece of metal, the handle comprising a portion next to the blade provided with alternating, oppositely-faced, longitudinal corrugations, and a flat portion beyond the corrugated portion.

818,010. **ROAD-GRADER.** JOHN W. LANGFITT, Adel, Iowa. Filed Nov. 6, 1905. Serial No. 286,126.



Claim.—1. In a road-grader, a carriage-frame, a carrier-frame flexibly and adjustably connected with the carriage-frame and a frame fixed to the lower end of the carrier-frame to support a colter-plow in the manner set forth.

2. In a road-grader, a carriage-frame, a carrier-frame composed of two parallel sides rigidly connected, an auxiliary frame fixed to its lower end and a colter-plow rotatably connected with the auxiliary frame, combined as set forth.

3. In a road-grader, a carriage-frame, a carrier-frame flexibly connected with the carriage-frame, to project upward laterally relative to the carriage-frame, and a rotatable plow carried at the lower end of the carrier-frame to operate as set forth.

4. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to the lower end of the carrier-frame to support a colter-plow in an inclined position and means to flexibly connect the carrier-frame with the carriage-frame.

5. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to the lower end of the carrier-frame and a colter-plow mounted therein and means to flexibly connect the lower end of the carrier-frame with the front portion of the carriage-frame.

6. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to one of the sides of the carriage-frame, to support the carrier-frame and frames fixed to the front end portions of the parallel sides of the carriage-frame, a cross-bar fixed to said frames, levers pivoted to the ends of the cross-bar and pivotally connected by a rigid bar and the free ends of the levers pivotally connected with the lower end portion of the carrier-frame by rods as required to flexibly connect the lower end of the carrier-frame with the front portion of the carriage-frame.

7. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to one of the sides of the carriage-frame, to support the carrier-frame and frames fixed to the front end portions of the parallel sides of the carriage-frame, a cross-bar fixed to said frames, levers pivoted to the ends of the cross-bars and pivotally connected by a rigid bar and the free ends of the levers pivotally connected with the lower end portion of the carrier-frame by rods as required to flexibly connect the lower end of the carrier-frame with the front portion of the carriage-frame, a plow on the lower end of the carrier-frame, an endless carrier-frame and means to raise and lower the carrier-frame.

8. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to one of the sides of the carriage-frame to support the carrier-frame and frames fixed to the front end portions of the parallel sides of the carriage-frame, a cross-bar fixed to said frames, levers pivoted to the ends of the cross-bars and pivotally connected by a rigid bar and the free ends of the levers pivotally connected with the lower end portion of the carrier-frame by rods as required to flexibly connect the lower end of the carrier-frame with the front portion of the carriage-frame, a plow of the lower end of the carrier-frame, an endless carrier-frame and uprights fixed on top of the carriage-frame, a rotatable shaft mounted on the uprights, drums fixed on the shaft and chains fixed to the drums and to the lower portion of the carrier-frame.

9. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to one of the sides of the carriage-frame to support the carrier-frame and frames fixed to the front end portions of the parallel sides of the carriage-frame, a cross-bar fixed to said frames, levers pivoted to the ends of the cross-bars and pivotally connected by a rigid bar and the free ends of the levers pivotally connected with the lower end of the carrier-frame by rods as required to flexibly connect the lower end of the carrier-frame with the front portion of the carriage-frame, a plow on the lower end of the carrier-frame, an endless carrier-frame and uprights fixed on top of the carriage-frame, a rotatable shaft mounted on the uprights, drums fixed on the shaft, chains fixed to the drums and to the lower end portion of the carrier-frame and means to rotate the shaft and also to retain it stationary.

10. In a road-grader, a carriage-frame, a carrier-frame extended upward and laterally at the central portion of the carriage-frame, a frame fixed to one of the sides of the carriage-frame to support the carrier-frame and frames fixed to the front end portions of the parallel sides of the carriage-frame, a cross-bar fixed to said frames, levers pivoted to the ends of the cross-bars and pivotally connected by a rigid bar and the free ends of the levers pivotally connected with the lower end of the carrier-frame by rods as required to flexibly connect the lower end portion of the carrier-frame with the front portion of the carriage-frame, a plow on the lower end of the carrier-frame, an endless carrier-frame, a rotatable shaft mounted on the uprights, drums fixed on the shaft, chains fixed to the drums and to the lower end portion of the carrier-frame means to rotate the shaft and also to retain it stationary and gearing connected with the carriage to actuate the endless carrier in the carrier-frame.

11. In a road-grader, a jointed carrier-frame, hinge members having stops extending downward and hinge members having braces extending toward the stops and bifurcated at their ends to engage the stops fixed to the sides of the frame, to operate as set forth.

12. In a road-grader, an elevator-frame flexibly connected with the carriage-frame, angle-irons fixed to the inside faces of the parallel sides, slats having double bends at their end portions, links fixed to the end portions of the slats, rotatable shafts in the ends of the frame and spur-wheels on the shafts to engage the links, to operate as set forth.

13. In a road-grader, an elevator-frame flexibly connected with the carriage-frame, angle-irons fixed to the inside faces of the parallel sides, slats having double bends at their end portions, links fixed to the end portions of the slats, rotatable shafts in the ends of

the frame, spur-wheels on the shafts to engage the links and a fender fixed to the lower end of the frame, to operate as set forth.

charge devices arranged in the path traversed by the same in their movement with said carrier.

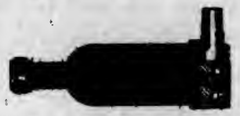
brought into communication with the discharge-aperture in said

leading to the end of the sweep, a ratchet located in a recess of the

the frame, spur-wheels on the shafts to engage the links and a fender fixed to the lower end of the frame, to operate as set forth.

14. In a road-grader, a frame for an endless carrier, an auxiliary frame fixed to the lower end of the carrier-frame, a concave-convex rotary plow mounted in the auxiliary frame and a scraper fixed to the journal of the plow, to operate as set forth.

813,011. **AIR-VALVE FOR RADIATORS.** FRED W. LEUTHESSER, Chicago, Ill., assignor to Monash-Younker Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 18, 1904. Serial No. 198,720.



Claim.—1. In an air-valve for radiators, the combination of a shell or casing inclosing a chamber having leading therefrom at its upper end a valve-controlled vent-passage, a base or cup into which is entered the lower end of the shell or casing, a central wall depending from the base or cup, a nipple projecting in line with the wall and furnishing an attachment for the valve to the radiator, the nipple having a passage in communication with the chamber of the shell or casing and the wall having a longitudinal passage with the port at the inner end thereof in communication with the passage of the nipple, and a movable stem operating in the passage of the wall and having an acting end controlling the port between the passage of the wall and nipple, substantially as described.

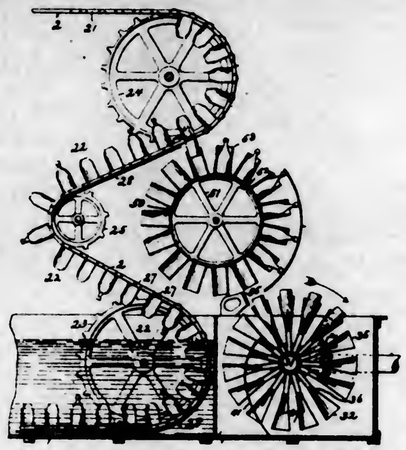
2. In an air-valve for radiators, the combination of a shell or casing inclosing a chamber having leading therefrom at its upper end a valve-controlled vent-passage, a base or cup into which is entered the lower end of the shell or casing, a central wall depending from the base or cup, a nipple projecting in line with the wall and furnishing an attachment for the valve to the radiator, the nipple having a passage in communication with the chamber of the shell or casing and the wall having a longitudinal passage with a port at the inner end thereof in communication with the passage of the nipple and a port opening therefrom adjacent to its inner end, and a movable stem operating in the passage of the wall and having an acting end controlling the port between the passage of the wall and nipple, substantially as described.

3. In an air-valve for radiators, the combination of a shell or casing inclosing a chamber having leading therefrom at its upper end a vent-passage, a float located in the chamber and provided with a valve-stem controlling the vent-passage leading from the upper end of the chamber, an expansible stem on which the float is mounted, a base or cup into which is entered the lower end of the shell or casing, a central wall depending from the base or cup, a nipple projected in line with the wall and furnishing an attachment for the valve to the radiator, the nipple having a passage in communication with the chamber of the shell or casing, and the wall having a longitudinal passage with a port at the inner end thereof in communication with the passage of the nipple, and a movable stem operating in the passage of the wall and having an acting end controlling the port between the passages of the wall and nipple, substantially as described.

4. In an air-valve for radiators, the combination of a shell or casing inclosing a chamber having leading therefrom at its upper end a vent-passage, a float located in the chamber and provided with a valve-stem controlling the vent-passage leading from the upper end of the chamber, an expansible stem on which the float is mounted, a base or cup into which is entered the lower end of the shell or casing, a central wall depending from the base or cup, a nipple projected in line with the wall and furnishing an attachment for the valve to the radiator, the nipple having a passage in communication with the chamber of the shell or casing, and the wall having a longitudinal passage with a threaded section and with a port at the inner end thereof in communication with the passage of the nipple, and a stem having a threaded body operating in the threaded section of the passage in the wall and having an acting end controlling the port between the passages of the wall and nipple, substantially as described.

813,012. **MACHINE FOR CLEANING BOTTLES.** CHARLES H. LOEW, Lakewood, Ohio. Filed Apr. 7, 1903. Serial No. 151,457.

Claim.—1. A bottle-rinsing mechanism, comprising a movable bottle-carrier, reciprocatorily-mounted fluid-discharge devices which partake of the movement of said carrier and are adapted to be projected into the bottles thereon, and retracting means for said discharge devices arranged in the path traversed by the same in their movement with said carrier.



2. A bottle-rinsing mechanism comprising a rotating wheel having bottle-receptacles, hollow reciprocatory fluid-discharge stems carried by said wheel and adapted to be projected into the bottles in said receptacles, means for supplying said stems with bottle-rinsing fluid, and means arranged in the path of movement of said stems for automatically retracting the same when they reach a predetermined place in the travel of the wheel.

3. A bottle-rinsing mechanism comprising a rotative wheel adapted to carry the bottles to be rinsed, hollow reciprocatory fluid-discharge stems carried by said wheel, means by which said stems are projected into the interiors of bottles by the pressure of rinsing fluid, and a cam-plate arranged to retract said stems when they reach a predetermined place in the travel of said wheel.

4. A bottle-rinsing mechanism comprising a rotative wheel having bottle-receptacles provided with side apertures, a cam-plate projecting into said apertures, reciprocative fluid-discharge means engaged by said cam-plates and moved thereby in one direction of their reciprocation, and means through which said fluid-discharge means are supplied with rinsing fluid.

5. A bottle-rinsing mechanism comprising a rotative wheel having bottle-receptacles, hollow fluid-discharge stems carried by said wheel and mounted to have movement therein, said stems having pistons, means for supplying rinsing fluid under pressure to the interior of said discharge-stems and to said pistons at a predetermined place in the travel of said wheel, whereby the stems are advanced to within the interiors of the bottles being rinsed, and relatively stationary means operating to retract said stems at a predetermined place in the travel of said wheel.

6. A bottle-rinsing mechanism comprising a rotative wheel having bottle-receptacles provided with side apertures, hollow fluid-discharge stems carried by said wheel and mounted to have movement therein and arranged in line with said receptacles, said stems having pistons, means for supplying rinsing fluid under pressure to the interior of said discharge-stems and to said pistons at a predetermined place in the travel of said wheel, and a cam-plate adapted to project into said apertures and to engage the ends of the discharge-stems and to retract said stems at a predetermined place in the travel of the wheel.

7. In a machine of the class described, a sprinkling-wheel comprising means for receiving the bottles mouth downward, means for introducing into the interior of the bottles jets of water, comprising a hollow hub supplied with water under pressure, hollow sprinkling-stems radiating therefrom and communicating therewith, said stems having plungers adapted to be forced forward by the pressure of the water to thereby project the stems into the bottles, and means for pushing the stems and plungers into place after use comprising a retracting cam-plate substantially as described.

8. In a machine of the class described, a hollow shaft adapted to be connected with a source of supply of rinsing fluid under pressure and having an aperture for the discharge of the fluid therefrom, a rinsing-wheel mounted to rotate on said shaft and provided with bottle-receptacles and with hollow spokes which are successively

brought into communication with the discharge-aperture in said shaft, hollow fluid-discharge stems mounted in said spokes and adapted to be advanced therefrom and into the bottles under the control of the water in said spokes, and stationary retracting means engaged with said stems at a predetermined place in the travel of said wheel.

9. In a machine of the class described, a hollow shaft adapted to be connected with a source of supply of rinsing fluid under pressure and having an aperture for the discharge of the fluid therefrom, a rinsing-wheel mounted to rotate on said shaft and comprising hollow spokes which are successively brought into communication with the discharge-apertures in said shaft and are provided with bottle-receptacles, hollow fluid-discharge stems mounted in said spokes and adapted to be advanced therefrom and into the bottles by the pressure of the water in said spokes, and a stationary cam-plate arranged to retract said stems at a predetermined place in the travel of said wheel.

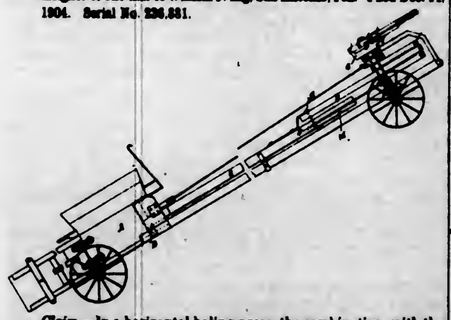
10. A traveling bottle carrying and rinsing means comprising fluid-discharge devices which are movable toward and from the bottles being carried, and stationary means for automatically retracting said discharge devices at a predetermined place in the travel of the carrier.

11. A bottle-rinsing apparatus comprising a traveling bottle-carrier having fluid-discharge devices provided with means whereby they are advanced toward the bottles by the pressure of the rinsing fluid, means by which the supply of said fluid is automatically controlled by the movement of the bottle-carrying means, and stationary means for automatically retracting said discharge devices at a predetermined place in the travel of said carrying means.

12. A bottle-washing device comprising a rotative bottle-carrying means, fluid-discharge devices carried thereby and mounted to reciprocate to and from the bottles, and means whereby said fluid-discharge devices are reciprocated, comprising stationary retracting devices engaged with said discharge devices at a predetermined place in the rotation of said carrying means.

13. In a bottle-washing apparatus, the combination with bottle-soaking means having a traveling carrier provided with bottle-holders, a bottle-rinsing means comprising a wheel having bottle-receptacles, fluid-discharge devices carried by said wheel and movable toward and from the bottles in said receptacles, means by which said discharge devices are advanced toward the bottles at a predetermined place in the travel of said carrier by the pressure of the rinsing fluid, stationary means by which said discharge devices are automatically retracted from said bottles at a predetermined place in the travel of said carrier, and means for delivering the bottles automatically neck downward into the receptacles of the rinsing apparatus from the carrier of the soaking means.

813,013. **HAY-PRESS.** ALEXANDER LORENZ, San Antonio, Tex., assignor of one-half to William J. Illg, San Antonio, Tex. Filed Dec. 14, 1904. Serial No. 236,881.



Claim.—In a horizontal baling-press, the combination, with the case and base-piece extending forwardly therefrom, of the power-frame mounted on the forward end of the base-piece, a crank-shaft journaled at its lower end in the base-piece and at its upper end in the power-frame and projecting above it, the plunger-pole mounted in guides on the base-piece, a retractile spring connected thereto and to the power-frame, a pitman pivoted to the upper side of the said pole and to the crank of the crank-shaft, a collar on the crank-shaft above the crank, a stay connected to said collar and to the press-case, a sweep-socket mounted idly on the upper end of the crank-shaft and having an arm extending therefrom for the attachment of a stay leading to the end of the sweep, a ratchet located in a recess of the sweep-socket and fixed to the crank-shaft, a looped pawl hinged to the sweep-socket, and a spring for holding the pawl in engagement with the ratchet, for the purpose set forth.

813,014. **CONTAINER FOR FILTER-PRESSES.** CHARLES W. MERRILL, Lead, S. D. Filed May 3, 1905. Serial No. 258,050.

Claim.—1. In a filter-press, a container provided with a wedge-shaped element along its inner surface.

2. In a filter-press, a container having an inner surface in the form of a keystone, with the large end extending outward into the interior substantially as described.

3. In a filter-press, a container provided with a keystone-rib along the entire inner surface of said container.

4. In a filter-press, a container provided with a series of keystone-shaped ribs along the entire inner surface of said container.
